

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

ARTES SCIENTIA VERITAS

THE Motor Car JOURNAL.

EVERY FRIDAY, ONE PENNY.

The Medium for all Interested in
SELF-PROPELLED TRAFFIC.

Conducted by Charles Cordingley.

TRANSPORTATION LIBRARY

INDEX TO VOLUME IX.

MARCH 2nd, 1907, to FEBRUARY 22nd, 1908.

Publishing offices:

CORDINGLEY & CO.,
27-33, CHARING CROSS ROAD,
LONDON, W.C.

Telephone Number:

2119, Gerrard.

Telegraphic Address:

"Indus," London.

Index to Vol. IX.—Motor-Car Journal.

The Asterisk indicates illustrated article.

ABYSSINIA, Motor Adventure in, 892.

Accessibility v. Permanency, 959.
ACCESSORIES, ETC.
Acer Clutch, 1047*.
Aitchison's Goggles, 636*.
Ajax Rims, 905.
Albo-Luthi, 130*.
Alpha Petrol Motors, 356*.
Ara Vulcaniser, 495.
Aster Engines, 846.
Auto Nut Pliers, 382*.
Avon Non-skid Tyres, 772*.
Bailey Detachable Mudguard, 515*.
Beresford Rim, 191.
Blieriot Headlight, 906.
Boisse Water and Oil Pump, 538*.
Bowden Carburettor Agitator, 338*.
Bowdenloo Lever, 918*.
Bramley Valve Attachment, 649*.
Bullard Speed Recorder, 1108*.
Chain Connections, 793*.
Chatter-Lea Terminals, 495*.
Clifford-Earp Side Doors, 1007*.
Coles' Spare Tyre Cradles, 714.
Coventry Roller Chains, 674*.
Coventry Simplex Motors, 67*, 811.
Covey Speed Indicator, 213.
Craven Automatic Carburettor, 126*.
Crypto Current Transformer, 474*.
Davis Paraffin Carburettor, 163*.
Davison Dash Filler, 152*.
Doherty Radiator, 453.
Dorwald Engine, 470*.
Duco Jack, 694*.
Duco Portable Turntable, 636*.
Dunlop Detachable Rim, 449*.
Dunlop Tyre Manipulator, 358*.
Durandal Non-skid, 166*.
E.I.C. High-tension Distributor, 7*.
Earp Tyre Carrier, 674*.
Edouard Wind Screen, 715*.
Eisemann Sparking Plug, 794*.
Elastos Filled Tyres, 671*.
Eyre Anti-skid, 166.
Fair's Lubricator, 193.
G. and R. Carburettor, 250*.
Garantire, 538*.
Gauthier Whistle, 793.
Gordon Wind Screen, 166*.
Grack Electric Horns, 165*.
H. D. W. Pump Gauge, 434*.
Hartley Speed Recorder, 334*.
Heron Tyre Pump, 164*.
Huillier's Improved Wind Shield, 27*.
Hunter Automatic Contract Screw, 412.
Indicator, A Novel Speed, 110.
Jef Valve Grinding Tool, 984*.
Johnson's Compression Tap, 454*.
Jones Speed Control Governor, 926*.
Jones Speed Recorder, 498*, 847, 966*.
Locke Change-speed Gear, 536*.
Locke Igniter, 905.
Marsh Terminal Clip, 152*.
Mero Change-speed Gear, 773*.
Motor Tyre Security Bolts, 1050*.
Nieuport High-tension Magneto, 1047*.
Oldfield Driving Mirror, 618*.
O. S. Speedometer, 270*.
Pack's Hinged Motor Bodies, 28.
Palmer Tyres, 138*.
Parson's Non-skid, 191, 906.
Perfecta Carburettor, 752*.
Petrol Motor, A Novel, 575*.
Polkey's 1908 Lamps, 1023.
Premier Accumulator, 274*.
Radyot Wind Screens, 656*.
Rapensy Tools, 208*, 214.
Renault Engine Starter, 1129*.
Ross Head Lamp, 849*.
Rushmore Lamps, 135.
Sawyer Non-skid Bands, 191.
Scott Tyres, 810.
Sealomatic Inner Tube, 1127.
Shock-shifter Hub, 164.
Simplex Shock Absorber, 164*.
Sioco Motor Tyre Inflator, 206*.
Sirdar Non-nipping Inner Tubes, 520*.
Six-jet Carburettor, 272*.
Smith's Speedometer, 846*.
Southall Compression Register, 866*.
Soy Tyre Manipulator, 1005*.

ACCESSORIES, ETC.—continued.

Starter, Automatic Engine, 695*.
Stepney Spare Wheel, 163, 906.
Stewart Semi-flash Boilers, 923*.
Summer's Wind Screen, 905.
T. and M. Carburettor, 150*.
Thomson-Bennett Contact Breaker, 560*.
Tyre Inflator, An Automatic, 1127*.
Unterberg-Helmle High-tension Magneto, 940*.
Vandervell Charging Plant, 636*.
Vandervell Fitting for Tail Lamp, 712*.
Vivian Non-skid, 214.
Voltoo Coil, 673.
Vulcan Specialities, 192.
Washburn Pressure Gauge, 232*.
Waterloo Wind Screen, 673*.
Waytes' Sparking Plug, 519*.
Whitehead Motor Tyre and Rim, 729*.
Wickstead Change-speed Gear, 163*.
Williams Motor Horn Attachment, 734*.
Windham's Detachable Bodies, 192*.
Wolsley Shock Absorber, 767*.
Yuncek Carburettor, 654*.
Zenith Automatic Carburettor, 961*.
Accumulators from Electric Light Circuits, Charging, 692*.
Advice which should not be Taken, 170.
Aeronautics, 119, 124*, 172, 324, 684.
Aeroplane Flight, Farman's, 1027.
Affiliation Question, 1097.
Africa by Motor-Car, Across, 536*.
Airship, The Military, 687*.

Motor-Car Journal.

VOL. IX.]

LONDON, SATURDAY, MARCH 2, 1907.

[No. 417.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

Vol. IX.

WITH this issue the *M.C.J.* commences the ninth volume of its chronicle of the automobile movement, a record that can be traced back through *Industries and Iron* to the *Mechanics' Magazine*, which, in the pre-Victorian days, was the only British journal that encouraged the early motor-car movement. Thus the *M.C.J.*, while contemporaneous with the revival of late years, can claim distinguished ancestry, linking up the newspaper history of the movement from the days before legislative stupidity and prejudiced interests set back the wheels of progress, to the present time, when the importance of the automobile is being universally acknowledged and generally encouraged.

Aeroplanes for the Show.

INVENTORS and designers anxious to participate in the honour and rewards that will be associated with the Aero Club Section of the Exhibition at the Agricultural Hall, London, in April, are reminded that entries should be sent to Mr. H. E. Perrin, the secretary of the Aero Club, 166, Piccadilly, W., not later than March 16th. Firms wishing to supply aeroplane accessories, motors, propellers, timber, aluminium, material for covering the "planes," &c., will also be afforded facilities for exhibiting their particular specialities at the Agricultural Hall. The models will be shown in the Berners Hall, reached from the main gallery of the building, while another gallery, capable of accommodating full-sized machines, will also be available. So far entries have been coming in very well and Mr. Perrin anticipates a very successful display. As to the method of starting the models, much will depend upon the wishes of the inventors. It is suggested that a narrow staging, five feet high, should be erected, but its use would be at the discretion of the exhibitors. So far the models promised for the exhibition vary in size from three feet to fifteen feet across the wings, and from three to thirty pounds in weight. Some competitors are entering five or six models.

The Wreck of the "Berlin."

WE regret to have to announce the loss of two gentlemen connected with the motor trade in the wreck of the "Berlin" on the Hook of Holland. Mr. Henry Spyker, who was drowned, is the brother of Mr. John Spyker, the owner of the Trompenburg Manufacturing Company, who make the Spyker car. The deceased gentleman was interested in the motor business, and was also controlling the petroleum wells belonging to the family, in Java. He had come to England to join his brother in transferring the motor business into an English company. Mr. Albert House, of Bradford, who had been associated with Messrs. Spyker Bros. since the commencement of their interest in the English motor-business, sends us a word of appreciation of the deceased gentleman, whose sense of business honour and general character he, in common with all who knew the late Mr. Henry Spyker, valued so highly. The other member of the motor industry who was lost in the ill-fated vessel was Mr. A. Elsworth, of Bradford, who was one of the first victims picked up after the wreck. Though terribly exhausted, he was found to be alive, but he expired in the passage between the vessel and the landing

stage. Mr. Elsworth had been identified with the motor-business for some time and was generally esteemed. The funeral took place on Tuesday afternoon amid every manifestation of sorrow on the part of many friends, while the Town Hall bell was tolled in token of the public sympathy with the bereaved widow and relatives.

A Chief Constable's Friendship.

Now that the Chief Constable of such an important city as Manchester has taken the chair at the opening of an automobile exhibition, it would appear that the lion and the lamb, otherwise the policeman and the motorist, may journey in amity and good fellowship. Mr. Peacock, the gentleman who has thus boldly blessed the automobile movement, declared that in his district, at least, drivers of motor-cars had nothing to fear so long as they acted reasonably and with due regard to the safety of other people on the road and thereabouts. Nearly two thousand motor-cars have been registered in Manchester, and yet there are fewer accidents owing to such vehicles than to any other class of traffic on the street. Evidently the utilitarian aspect of the movement appeals to the northern mind, and the welcome which the authorities have accorded the automobile is generally in striking contrast to the sullen assent accorded to its progress in some of our southern towns.

Trials for Small Motor-Cars.

THE Automobile Club of Great Britain and Ireland announces that its technical committee is considering the subject of holding next year either a series of trials or a race of the Tourist Trophy sort for small motor-cars. It is felt that the step is a necessary one, because the original Tourist Trophy race and such reliability trials as those organised by the Irish and Scottish Automobile Clubs chiefly serve the purpose of encouraging the moderate-powered car, while the Heavy Touring Car race that will be held in the Isle of Man in May next encourages yet a larger class of vehicle. Thus the small car is the only one that is not specially catered for. On Thursday, the entries at ordinary fees for the International Tourist Trophy race and for the Heavy Touring Car race closes, there being twenty-five entries for the Tourist Trophy race and seven for the larger car event.

Roads in Town and Country.

THE roads of a city, town, or urban district are hardly comparable with those of a county, or rural district, as they are constructed and maintained upon entirely different lines. As a rule the principal roads of a town have a solid formation which is not less than 12 in. thick, which may consist of 8 in. or 9 in. foundation, covered with 3 in. or 4 in. of hard macadam thoroughly consolidated, which in the case of Gloucester consists of Clee Hill Dhu stone, a basalt from Ludlow, Shropshire, whereas the majority of county and country roads consist of a coating of macadam, frequently of local stone, simply laid upon and rolled into the natural surface of the ground, which in a long length of road varies considerably. Such a road is very good in fine weather, when consolidated, but it makes a great deal of mud in wet weather, and if the mud and dust is not regularly removed by scavenging operations, motor and other traffic has a great effect upon it. On the other hand, on a town road constructed as already mentioned, the motor

B

traffic, as Mr. R. Read, A.M.I.C.E., the City Surveyor of Gloucester, informs us, is a mere incident in the general traffic, and if it were not for the constant breaking up of the streets of a town for water, sewer, gas, electric light and other purposes, motor traffic would have little or no appreciable effect upon the roads. This constant breaking through the crust and foundation of the road causes weak places which take years to recover.

Bridge Tolls.

THE Motor Union recently decided to take action in the case of the tolls imposed at the Langstone Bridge, Havant. The lessee, it is alleged, has been charging excessive tolls for motor-cars crossing the bridge. This bridge is the only means of road communication between Hayling Island and the mainland, and the matter is therefore of importance to motorists travelling to and from the Island. The bridge is leased from the L. B. and S. C. Railway, and it is alleged that, with the consent of the railway company, the lessee raised the charges for motor-cars, though under the Bridge Act he was not entitled to do so. The charge is now 1s. including return, whereas it was formerly 6d. As the result of numerous complaints, the Motor Union obtained a copy of the Act under which the bridge

The Toll Gate at Langstone Bridge connecting Hayling Island with the mainland, concerning the toll for crossing which action has been taken by the Motor Union.

was built, and thoroughly investigated the matter. In the result it instructed its local solicitors, Messrs. G. H. King and Franckeiss, of Portsmouth, to act for Dr. Albert May, of Hayling Island, a member of the Union, who has laid an information before one of the county justices that "being the lessee of the tolls of the Hayling Bridge with the meaning of Section 69 of George IV., Cap. 9, did unlawfully demand an excessive toll under Section 64 of the said Act for a certain carriage with four wheels called a motor-car, propelled by other means than animal power, when passing or repassing over the bridge leading from Havant to Hayling Island, to wit, the sum of sixpence each time of passing or repassing with such motor-car."

Motor-cars regarded as Carriages.

THE case came before the Havant justices on Saturday, Earl Russell appearing in support of the information. Counsel recounted what we have written in the preceding paragraph, adding that in the schedule of charges the toll for every cart or carriage drawn by one horse was sixpence. Motor-cars at that time, added counsel, were not contemplated, but the

Light Locomotives Act of 1896 enacted that motor-cars less than two tons in weight were liable at toll gates to the equivalent charge for a carriage drawn by one horse. In the case of the Langstone Bridge, power was given to reduce the charges, and the price for a one-horse vehicle crossing the bridge was now sixpence return. Until April, 1905, the toll for a motor-car was the same, but after that date the toll was increased to sixpence each way. Counsel contended that the proper charge for a motor-car was the same as that for a carriage, and that, therefore, the charge made to the complainant was excessive. The defendant, on the other hand, urged that he was perfectly within his right in charging the amount mentioned for motor-cars, as that was the toll allowed in the schedule under the Act. He further stated that there was no bridge in England where a less toll than sixpence was charged. The magistrates deferred their decision.

Enthusiasts.

ON Friday, the 8th inst., the annual meeting of the A.C.G.B.I. will be held at the Club House, and the election of the committee is already attracting some notice, the nominations having been concluded. The attendances at committee meetings during the past year give an idea of the amount of work done by those who take a prominent part in the movement. Capt. Dyke Acland made an actual attendance of 63 out of a possible 80; Mr. Worby Beaumont, 61 out of 86; Professor Vernon Boys, 48 out of 73; Dr. Hele-Shaw, 40 out of 70; Mr. Mervyn O'Gorman, 58 out of 91; Earl Russell, 59 out of 78; Mr. A. G. New, 44 out of 66; and Mr. J. Lyons Sampson, 80 out of 90—the best proportion of all. When it is remembered that these gentlemen are distinguished in other walks of life their devotion to the routine of committee is all the more commendable. At the other end of the list is the gentleman who attended 3 times out of 47.

Arbitration v. the Law Courts—and Costs.

MOTORISTS are fairly well schooled in the expensive luxury known as the law. Of course when the police instigate its operation the defendant must have recourse to advice, but there are many misunderstandings in business which are well avoided without appeal to the courts. Recognising this fact, the Motor Union has added an arbitration department to its many activities, and although its existence is often overlooked its value is undoubted. It can be quickly set into motion, bringing into the matter technical experts who understand the subject in dispute without having to be informed by counsel explaining things from two opposing points of view. The other day a Coventry motor firm and a Yorkshire motorist had a difference which would probably have required legal aid to adjust, but a mutual agreement to refer it to the Motor Union has led to the nomination of Mr. Walter Bourke, M.I.C.E., as arbitrator, and it will now be settled with a minimum of expense and delay.

Splashing Pedestrians.

QUITE a careful guard is kept by the Committee of the Sheffield A.C. over the behaviour of the members and their cars, and complaints have lately been made as to local motorists driving fast on dirty roads and splashing with mud the pedestrians unfortunate enough to be on the footpath at the time. So the committee "call attention to this, feeling sure that members will do all in their power to minimise such inconvenience." At Chesterfield, too, trouble has arisen from the same cause, and the matter has been discussed at the meeting of the Town Council by the friends of persons who have been too near to moving motor-cars on muddy days. But, now that so important an organisation as the Sheffield Club has drawn attention to the matter, it may be taken for granted that some mitigation of the nuisance will take place. It is not pleasant to get streams of mud shot up from the roadway, and if motorists are to go slower the local

authorities should move faster in their efforts to keep the streets clean.

The Non-skid Trials.

THE Expert and Technical Committee of the Automobile Club, who acted as the judges in the preliminary test of the Side-slip and Skid Prevention Competition, reported in our issue of the 9th inst., have met and considered the performances of the various devices which underwent this practical test of their capabilities. The following have been permitted to take part in the Road Endurance Test:—No. 7, Floating metal ring, wood-lined (Parsons Non-Skid Co.); No. 8, Floating metal ring (Mr. George B. Winter); No. 22, Three pairs of wheels, back and front steering (Mr. H. B. Molesworth); No. 32, Rubber blocks, multi-sectional in direction of rotation (Hartridge Tyre Syndicate); and No. 34, Tyre of rubber and leather rings (the Westminster Industrial and Finance Developments, Ltd.). This part of the trial is now proceeding daily between Putney and Shoreditch. For this test the devices are fitted to motor-omnibuses, and will be put into actual service until a distance of about 1,000 miles has been covered in suitable weather.

Government Motor-Cars.

THE proceedings of the new committee promised on Monday by Mr. Haldane to examine the engineering establishment at Woolwich, with a view to ascertaining whether other things can be made there beside munitions of war, will need to be carefully watched. The members below the gangway of the House of Commons on the Opposition side have already expressed the view that motor-cars might be designed and made in the Arsenal, and the experts whom they will suggest as members of the committee will probably have such work in mind. As the mobility of the Army is increased the importance of the motor-car will, of course, come into greater prominence, and doubtless some of those who have been affected by the discharges from Woolwich Arsenal feel that the development of automobile manufacture would provide an avenue for their labour. But they have not paid any regard to the difficulties of the undertaking, apart from the commercial policy involved.

A Disinfecting Influence.

SOME market gardeners in the west of England attributed their excellent crops of apples last season to the influence of dust in preventing possible blight. Now the "British Medical Journal" says that an analysis of the dust and oily particles carefully collected by means of sterilised pipettes from under the head of a motor has failed to reveal any micro-organisms whatever, and cultivations gave absolutely negative results. This would seem to show that, so far from being an agent of contamination, the motor, by the heat which it generates, actually disinfects the dust and other foreign matter which comes in contact with it as it rushes along. If this can be shown to be true, the motor would cease to be the nuisance it too often is to all but those whom it carries, and people half-suffocated by the clouds of dust which it raises would, at any rate, have the comfort of believing that the matter which chokes their lungs is aseptic.

Training Grounds for Drivers.

WHERE are motorists to be trained? This is a problem that has perplexed many novices, and has worried their teachers. So far as large towns are concerned it is not always easy to find the silent highway along which the necessary first steps in driving can be made; and there is no doubt that the roadways through parks and open spaces have been freely utilised for the purpose. As a general rule there are certain hours of the day when such thoroughfares are little used by ordinary traffic, and no harm need be done by automobile pupils. But such a practice is illegal, so far as the Royal parks about

London are concerned, and those who receive or give instruction in motor-car driving in such places render themselves liable to arraignment before the Kingston or other Benches—from which, it must be remembered, there is little escape for the motorist. Fortunately a majority of the people who take to motoring have had previous experience of traffic problems—either as drivers of horse-drawn vehicles or cyclists—so that the road-fright, which might otherwise render their pupilage stage somewhat dangerous to the community, is lessened in a great degree. Given this experience, and the knowledge gained in a well-equipped garage, there does not seem much risk in a careful man or woman taking the wheel where traffic is uncongested and roads are fairly wide. Hence the restriction that is now the rule in Royal parks has the appearance of harassment, which should be above the dignity of a Government department. Even the Kingston magistrates have declined to take a serious view of the first cases brought to their notice, and mentioned in last week's *M.C.J.* But there is no reason to expect a continuance of such a reasonable attitude, and those who try their 'prentice hand in Richmond Park should beware—or, cheaper still, try fresh fields for instruction.

A Motor 'Bus in the Snow in Berlin.

Who's Who.

"WHO'S WHO" is bulkier than ever, and as accurate as formerly. That is high praise for the 1907 edition of Messrs. A. and C. Black's annual directory of modern men and women who have made anything of a ripple on the great ocean of fame. Many interesting personal glimpses of living people can be gleaned from its 2,000 pages, and its columns of twice that number. The Rt. Hon. J. H. A. Macdonald, with his host of titles to distinction, and his recreations extending from lawn tennis tournaments to football arbitrations, is one of the few celebrities accorded a column to themselves. Motoring is not placed in the category of Lord Montagu's recreations, nor does it find a place in the pleasures of the Hon. Arthur Stanley. According to "Who's Who," however, it is the sole amusement of Professor Herkomer. Sir Henry Norman, M.P., associates fishing and automobilism with his recreations, while of the recreations of Mr. Timothy Richard, of Shanghai, the famous missionary to the Chinese, it is said that he has "none, if not electricity, petrol engines and flying machines." Altogether this interesting volume is a useful guide to the hobbies as well as the details which make up the lives of men and women of to-day.

SEVEN YEARS OF PROGRESS.

THE accompanying illustration conveys a vivid idea of seven years of development of the White steam car. On the left is the original type, built in 1901. Then follow in order the models of each successive year, terminating with the 1907 pattern on the extreme right. Tracing some of the steps in the development, and comparing, first of all, the 1902 car with that of 1901, it will be noted that the 1902 model was provided with a condenser and that the engine was completely enclosed; also, the comfort of the passengers received more attention, as evidenced by the addition of a hood.

In 1903 the car underwent a considerable change in the arrangement of parts, as well as in size. The engine was placed in front under the bonnet and the car took on the appearance of a "touring car," in the common acceptance of the term. Also, a compound engine took the place of the two simple engines previously employed.

Then in 1904 the alterations were not so pronounced, consisting of an increase in the size and luxury of the tonneau, longer springs, larger oil cups, and other changes to adapt the machine to a wider range of action.

The wheel base, size of wheels, tonneau, &c, were again increased in 1905, and, most important of all, the device of the "free engine" and "emergency gear" were introduced.

In 1906 came a further lengthening of the wheel base, together with the introduction of the down draught burner, a side entrance tonneau, and numerous minor mechanical changes.

The normal seating capacity is raised to seven in the present year, 1907, the power is practically doubled as compared with the 1906 car, and the improvements include a simplified regulating system whereby the pressure and temperature of the steam remain constant under all conditions.

It is interesting to note that the generator, the fundamental feature which distinguishes the White car from all other machines, is absolutely the same in the latest car as in the first, except, of course, for difference in size and capacity. The shaft drive has been consistently employed since 1903, as has also the compound engine of the vertical marine type. Finally, it is convincing evidence of the longevity of the steam car that every one of the cars shown is in good running condition. In fact, excepting the 1901 and 1907 models, which are the property of the White Company, all of the cars shown in the accompanying photograph are in daily use by private owners in Cleveland, Ohio, U.S.A., where the White cars are manufactured, and who loaned their machines for the occasion. It is scarcely necessary to add, Mr. Frederic Coleman, who has lately opened a depot in Edinburgh, represents the interests of the White steam car in this country.

FROM Argylls Ltd. we have received a copy of the 1907 edition of the catalogue of Argyll cars, which is a model of its kind, inasmuch as not only are full particulars given of the different vehicles, but the leading details are illustrated by carefully executed drawings. Several pages are devoted to "Hints to Users," a perusal of which should assist owners of Argyll cars in keeping their vehicles *au point*.

In the early spring days the cautious motorist will review his tyres and get them into running order for the season. Although pneumatics have not yet lost their terrors—as H.M. the King found the other day when delayed by a puncture for two hours on Harpenden Common—the adoption of efficient non-skids will do something to prevent their frequent occurrence. Much depends on the way these are fitted, and as a specimen of excellence in this respect we have had submitted a sample section of the non-skid tread of the Acme Rubber and Tyre Company, of 343, St. Vincent Street, Glasgow. This can be vulcanised to old or new covers, and constitutes a repellant to any pointed arguments that may arise on the road. The rubber is of high grade quality, a remark which also applies to the chrome leather. The Egyptian cloth which is inserted is of the finest brand, and altogether the composition of the tread, with its case-hardened studs, is of a really notable character. The firm have confidence in their productions, which they guarantee for three months.

The Seven Stages of the White Steam Car Development.

CONTINENTAL NOTES.

The Grand Prix Race.

French manufacturers are losing no time in making themselves acquainted with the Seine-Inferieure circuit, on which the Grand Prix race is to be held, Garchet, on a 120-h.p. Clement-Bayard, having already had a run over the course. The three cars which this company are building for the Grand Prix race will, it is stated, have engines comprising four cylinders 160 mm. bore by 160 mm. stroke; while the racing machines the Motobloc Company, of Bordeaux, are constructing will be of 120-h.p.

A Voiturette Race in Italy.

In connection with the Turin Motor-car Exhibition a voiturette race was run off on Sunday last over a 36-kilometre course, which had to be covered three times. There were only five starters—two Lion Peugeots and three O.T.A.V.'s—the winner being Giuppone, who, on one of the first-named cars, covered the distance in 2 h. 33 min. 11 sec.

Encouraging Motor Designers.

With the view of encouraging its members in improving the design of the main parts of motor-cars, the Société des Dessinateurs de l'Industrie Automobile, of Paris, is organising a competition for the best design of (1) clutch, (2) brake, and (3) change-speed gear control. Each competitor is required to mark his drawings and papers with a number or device, repeating the same on a sealed envelope containing his name and address. The awards will be made by a jury consisting of three motor-car manufacturers, the editors of two motor journals, and two chief designers. Four prizes are to be awarded, and the successful designs will remain the competitor's property. The unsuccessful ones are to be burnt without the competitor's name being made known.

Hunting for the Stolen Motor-Car.

The members of the Auto-Moto Club of Marseilles enjoyed an excellent morning's sport on Sunday last when they played a new game—that of hunting for a stolen motor-car. A large car, which it was supposed had been stolen, had been secretly hidden by a motorist on the outskirts of the city, and, after

A Parisian Motor Dust Wagon.

Another French Touring Car Trial.

The automobile clubs of the Auvergne and the Centre are organising an international trial of touring cars, which is to be held from the 8th to the 19th of August next. The competing vehicles will be divided into four categories on a total weight basis, this including the passengers, their luggage, spares, &c.:—(1) 1,600 kilogs. and over, average speed required 30 kilometres per hour; (2) from 1,000 to 1,600 kilogs., average speed 30 kilometres; (3) 650 to 1,000 kilogs., average speed 25 kilometres; (4) 200 to 650 kilogs., average speed 25 kilometres. The programme is as follows:—August 8th, weighing in at Clermont-Ferrand; August 9th, run from Clermont to Le Puy; August 10th, Le Puy to Aurillac; August 11th, Aurillac to Clermont; August 12th, Exhibition; August 13th, Clermont to Bourges, a hill-climbing trial being carried out *en route*; August 14th, a speed trial over a thirty-four kilometre course near Bourges; August 15th, Exhibition; August 16th, Bourges to Vichy; August 17th, Exhibition; August 18th, speed trial at Vichy over the flying kilometre; August 19th, fête and prize distribution. Full particulars of the competition can be obtained from the Automobile Club d'Auvergne, 18, Place de Jaude, Clermont-Ferrand.

a description of the vehicle had been circulated, about a score of motorists turned out at eight a.m. with the view of recovering the "lost property." For an hour or so the amateur detectives scoured the district on their cars, but it was not until near midday that the "thieves" were discovered, and, with their "booty," hauled back to head-quarters. It is said the game proved so successful that it is to be repeated on a later occasion.

Miscellaneous Items.

One result of the decision to hold the Grand Prix race on the Seine-Inferieure circuit is seen in the formation of an automobile club at Eu, near Dieppe.—Public services of motor-cars are being established between Ajaccio, Vico and Sartene, Corsica.—The seventh annual Austrian motor-car exhibition was opened in Vienna on Thursday, the 28th ult., and will continue until the 12th inst.—A public motor-car service is about to be inaugurated between Verona and Chiesannova, Italy, a distance of 20 miles. Two 25-h.p. Orion vehicles will be employed.—M. Van Marcke is continuing his tour on the Hotchkiss six-cylinder car, his journeys during the past week having been from Nice to Toulon, Marseilles, Aix-en-Provence, and Nimes.

SOME CURRENT TOPICS.

Are Cars Becoming Too Complicated?

Some interest has been aroused in motoring circles in France by the somewhat vigorous attack which has lately been made on modern tendencies in motor-car construction by M. Baudry de Saunier in the columns of our French contemporary, "L'Omnia." The main feature of his complaint is that, instead of automobiles becoming simpler, so rendering them available for use by the masses, they are steadily developing towards great complexity, their employment being consequently restricted to the wealthy classes who can afford to employ trained mechanics to look after their vehicles. By way of illustrating his point, he

upon the motor-car as a sort of El Dorado, the outcome being the production of such unnecessary devices as those which cause a bell to ring and so warn the driver whenever a tyre punctures, and a thermometer arranged to be fixed to the dashboard to constantly indicate the temperature of the water in the radiator! If this tendency is persisted in, the result will be, he considers, that just as there are people who would so "improve" present-day conditions as to render life not worth living, so motor-cars will become such works of art that it will be impossible to run them. Although M. Saunier has doubtless purposely given a somewhat exaggerated idea of the tendencies of the times, yet it must be admitted that behind it all there is a substratum of much that is true, and that there are many directions in which the genius of designers can yet be usefully directed.

Some Hints on Steering Gears.

Slackness in the steering gear may be due to several things. The most usual fault is the fairly quick wear on the pins in the

Instructing the Vienna Police in the driving of Motor-Cars.

[Allgemeine Automobil Zeitung.]

draws attention to the fact that, whilst in 1900 cars had a maximum of three pedals, some have now five; that as against two principal organs to feed the carburettor, there are in 1907 at least seven, and that within the same periods the number of main parts in clutches have increased from three to five or six. While this list could be easily extended, M. Saunier readily admits that some alterations which have been effected, notwithstanding that they have added to the number of parts in an automobile, certainly constitute improvements, and in this connection he instances the adoption of ball bearings as not only slightly increasing the efficiency, but as reducing the amount of care and attention this portion of an automobile's anatomy formerly required.

Designers and Inventors on the Wrong Track.

Having drawn the attention of motor designers to what he considers their evil ways, M. Saunier next alludes to the bad example they are setting to inventors, who have begun to look

various joints; also the wear in the ball-and-socket joints, the latter being, in most cars, adjustable. All steering connections should always be covered with leather pockets well filled with grease. Sometimes the wear will be found in the actual steering box. If the steering is of the worm and segment type, looseness in the worm can usually be adjusted by tightening up the thrust pin at the bottom of the box. If play is still apparent, the rivets or bolts which hold the sector to the shaft will in all probability be found loose, in which case new ones should be fitted. Another type of worm steering dispenses with the sector, the screws working in a large nut, which carries two forks on a square each side. There is very rarely much play between the screw and the nut, any looseness arising being due to the forks on the squares opening a little. These may be restored to their former position by carefully closing in a vice. It should be here remarked that it is very bad for any steering gear to be strained—the steering wheel should not be moved unless the car is moving.

THE IRISH RELIABILITY TRIAL.

MEMORIES of the Irish Fortnight and the Gordon Bennett Race of 1903 will be awakened by the announcement of the Reliability Trials which are being organised by the Irish Automobile Club for May 22nd—25th of the present year. In 1906 the motor-car organisation of the Emerald Isle was unfortunate in the fact that a similar event was arranged for a time that clashed with the bolder ad-

ventures of the Scottish Club; but, as a month will intervene between the Scottish and Irish trials this year, the latter will have a better chance of attracting entrants from this side of the water.

In promoting the Trial the Club will have primary regard to reliability in touring, although hill climbs and timing over a measured distance on the level will be introduced to test the all-round efficiency of the vehicles in the competition. There will be two sections, one in which cars may be entered irrespective of ownership and the other limited to vehicles owned by members of the A.C.G.B.I. or any of its affiliated clubs, and "driven by the entrant or a member of his family ordinarily resident in his house." This section will, therefore, be restricted to amateurs and no traders will be eligible to enter a car therein. Entries will be accepted on forms to be obtained from the secretary of the I.A.C., at 34, Dawson Street, Dublin, not later than the 7th inst., those arriving after that date and before April 25th being charged double fees. The classification of the vehicles entered will be as follows, Classes A and B being for two-seated cars:—

Class.	Minimum selling price of cars.	Maximum selling price of cars.
A	...	£150
B	...	£250
C	£150	£250
D	£250	£350
E	£350	£500
F	£500	£650
G	£650	£850
H	£850	...

The selling price means the price of a complete standard vehicle with all necessary tools and lamps and in a properly finished condition. Except in classes A and B all cars must have fixed seating accommodation for four adults, and in all other classes except C all vehicles save those in Section 11 (for amateurs) must have side-entrance bodies with independent doors to the rear seats. In class C the style of body will be optional. Efficient silencers will have to be fitted.

Observers will be appointed as in the Scottish trials and other regulations generally follow familiar lines; as do also the awards, based on (a) reliability in touring, (b) times on the hill climbs, and (c) time over a measured distance on the level.

The routes over a course of 564 miles will be as follows:—

May 22nd (149½ miles).—Dublin to Portrush, *via* Drogheda, Dundalk, Newry (luncheon), Lurgan, Antrim, Ballymena, Ballymoney, Portrush.

May 23rd.—Portrush to Dublin, *via* Coleraine, Magilligan, Limavady, Maghera, Cookstown, Dungannon, Armagh (luncheon), Carrickmacross, Ardee, Slane, Dublin.

May 24th.—Dublin to Waterford, *via* Blessington, Hollywood, Glendalough (luncheon), Rathdrum, Ovoca, Woodenbridge, Arklow, Gorey, Enniscorthy, New Ross, Waterford.

May 25th.—Waterford to Dublin, *via* New Ross, Graigue-na-Managh, Innistigone, Abbeyleix (luncheon), Maryboro, Monasterevan, Kildare, Newbridge, Naas, Dublin.

THE last day of entry for the Vapour Emission competition of the A.C.G.B.I. is to-day (Saturday). This competition has been inaugurated by the Club with the object of encouraging the improvement of the design of existing petrol-driven motor-cars, in order to diminish the nuisance caused by foul exhaust.

THE E.I.C. HIGH TENSION DISTRIBUTOR.

WITH the view of meeting the demand for a combined contact-maker and high-tension distributor for use on multi-cylinder engines in connection with a single coil, the Electrical Ignition Company, Ltd., Birmingham, have recently introduced the apparatus illustrated herewith. The low-tension make and break device is located at the inner end of the case, and as seen in Fig. 1, it comprises a hardened steel cam fixed on a spindle driven by suitable gearing off the engine; as the cam rotates it lifts by means of a roller a short arm provided with a contact formed of a special platinum alloy and

Figs. 1 and 2.—Sectional views of E.I.C. High Tension Distributor.

brings the latter into connection with a corresponding contact to which the low-tension wire is attached. There is no rubbing action at the points, so that the trouble of pitting is avoided, while provision is made for easily taking up any wear. As regards the high-tension portion, a sectional view of which is seen in Fig. 2, and a front view, with the cover detached, in Fig. 3, it will be seen that on the same spindle as the cam is keyed an insulated disc, to which is attached the metal distributing arm 2. The current is conveyed to the latter by means of the spring contact 3, fixed in the cover of the apparatus. The distributor is made with a sufficient number of terminals for the engine on which it is to be used—four or six cylinders, as the case may be, the illustrations showing it arranged for the former—and as the arm 2, in rotating, passes the various insulated poles, to which

Fig. 3.—General View of the E.I.C. High Tension Distributor with cover shown detached at right.

are connected the wires from the separate plugs, the current jumps to each in turn, thus completing the circuit and causing a spark to pass across the points of the plug in each cylinder in rotation. The timing is so arranged that the low tension contact is made every time the revolving arm 2 passes a high tension terminal. The Electrical Ignition Company have submitted to us for inspection one of the distributors as arranged for a six-cylinder engine; needless to say it is splendidly made and should give excellent results in practice, it being designed to work with reliability even at high speeds. One point to which attention may be drawn is that all the parts are so arranged that they can, if necessary, be easily dismantled.

A VISIT TO COVENTRY.

WHERE THE ROVER CARS ARE MADE.

IT needs but little intuition, on arriving at the City of Spires, to appreciate that Coventry is at present enjoying a wave of industrial prosperity which is of even greater dimensions than that experienced in the palmy days of the cycle trade. That the latter is by no means exhausted is indicated by the many extensions to cycle factories which are at present in hand, and this branch of industry is undoubtedly contributing its quota to the great commercial activity prevailing. At the same time, there can be no doubt that this very satisfactory state of affairs is mainly due to the considerable

Fig. 1.—General View of the Rover Metal-to-Metal Disc Clutch.

development that has taken place during the past few years in the motor industry. Some idea of this expansion was afforded in a recent issue of the *M.C.J.*, when it was pointed out that in the Daimler works alone 2,500 hands are employed on motor work, that the Humber Company employs 2,500, and, that, in addition to these two prominent firms, there are many others, such as the Swift, Rover, Maudslay, Singer, Deasy, Standard, Rex, West, White and Poppe, all employing an increasing number of men. As for cars, these are almost as numerous in Coventry as flies in summer, vehicles with makeshift bodies flying about in all directions, undergoing their road tests prior to being handed over to the body-building departments.

The object of our visit to the Midlands was to accept the invitation of Mr. Harry Smith, the managing director of the Rover Company, Ltd., to look over the factory in which Rover cars are being turned out. So rapidly have these vehicles sprung into popularity that special steps had to be taken to increase the output, with the result that during the past twelve months practically every available piece of land at the Meteor Works has been covered with large and well-lighted single storey workshops, while already further extensions are in contemplation. As we rapidly passed through the different shops we were able to obtain some idea of the thoroughness with which the Rover Company have taken up the construction of motor-cars. Beginning with the foundry, we saw the men busily engaged on the production of castings in malleable iron, gun metal and aluminium, the variety of the latter ranging from radiator fans to engine base chambers. Attention was next turned to the machine shop, where the operations of cylinder boring, crank shaft turning, as well as others too numerous to mention, were in progress. We were specially interested in watching the manufacture of the special valve cam sleeve, which is of intricate design and forms one of the special features of the Rover cars, permitting, as it does, the engine to be used as a brake. By means of this sleeve, which is so arranged that it can be moved longitudinally on the cam shaft, not only can the inlet valve be kept closed as desired and the admission of petrol vapour thus prevented, but the ordinary cam below the exhaust

valve is withdrawn and its place taken by a double one, which opens the valve twice to every revolution of the shaft, with the result that air is taken in from the exhaust pipe on every downward movement of the piston, compressed on the upward stroke and then exhausted; an arrangement which gives such a pronounced braking effect that ordinary hills may be descended without recourse to the brakes.

From cams we next turned our attention to the cutting of the bevel gears, which constitute an important part in the transmission mechanism of live axle cars; and here again we found that special care is taken in the manufacture in order to ensure the production of silent running gears. A feature of the machine shop is the international character of the tools it contains, for, while the majority is of British construction, the Rover Company have not hesitated to acquire from America or the Continent machines specially designed for particular purposes—in other words, they have adopted the wise policy of making their selection from the best the world has to offer. Unfortunately time did not permit us to give more than a passing glance to the departments in which the manufacture of the Rover carburettor, water circulating pumps, and other components, were being carried on, but, hurrying to the erecting shop, we found somewhat of a surprise in store for us. We have frequently heard it stated that the demand for single-cylinder cars is dead, a view with which, had we been at all inclined to agree, would have been quickly dispelled at the sight of such a large number going through, both of the 6-h.p. and 8-h.p. models, in addition to a goodly proportion of the Rover 16-20-h.p. four-cylinder cars. The chassis, on emerging from this shop, and are being handed over to what is termed the finishing department, where the bodies are fitted, are subjected to a road test of from fifty to seventy-five miles, in the course of which due note is made of any portion which needs adjustment, in order that the cars shall reach the purchasers in perfect condition. In the body department we saw a variety of operations in hand, while in the large paint-shop vehicles were being finished off in a variety of colours equalling that of the rainbow. Still another extensive shop is that in which repairs and adjustments are carried out, while a further large building is devoted to the storage of completed vehicles. It is here that the best idea can, perhaps, be obtained of the extensive business the Rover Company is doing, for since the turn of the year the number of cars despatched has been exceeding thirty per week—a testimony in itself to the popularity the vehicles are enjoying in motoring circles.

At the present time three sizes of cars are being turned out, viz., 6-h.p. and 8-h.p. single-cylinder and 16-20-h.p. four-cylinder, all having three speeds forward and a reverse and transmission by a cardan shaft and bevel gear to a live axle. Among their

Fig. 2.—The Dissembled parts of the Rover Clutch.

principal features, in addition to the cams which permit the engine to be used as a brake already referred to, are the special Rover carburettor and metal disc clutch, the *bloc* construction of the engine and gear-box, and, in the case of the 8-h.p. and 16-20-h.p. models, the three-point suspension of the frame and the fitting of ball bearings to the crank shafts of the engines.

THE Tyne Improvement Commission, in conjunction with the North Eastern Railway, have issued an illustrated guide to the Tyne as a industrial centre, and showing that on its banks are suitable places for the establishment of new works.

THE Bishop of Cashel has just bought a 15-h.p. Coventry Humber car through the Waterford agent of the company, Mr. W. F. Peare.

MONDAY next is the last day for tendering for the supply of motor-buses for the Metropolitan Asylums Board, which has decided to purchase two vehicles for the use of patients in its institution.

PRINCE LOUIS OF BATTENBERG, the Duchess of Marlborough, Sir Felix Schuster and Mr. Leopold de Rothschild are now owners of Siddeley cars.

MR. W. D. DURRELL, of Benares, used Continental tyres on the Fiat car with which he won distinction in the recent Reliability Trials in South India.

A NEW burner for steam motor vehicles, designed by Mr. S. Stackard, is being put on the market by Messrs. J. A. Curle, Ltd., Horner Road, South Hackney, N.E.

MESSRS. COLIN DEFRIES, LTD., have taken showrooms at 2, Denman Street, Piccadilly, W., where the Porthos car will be seen when present alterations are finished.

BRIGHTON Watch Committee have granted the application of a cab proprietor for permission to transfer the licences of ten horse-cabs to ten motor-cabs, which will be the first run in Brighton.

THE Jedburgh Town Council is suggesting to the Secretary for Scotland that local authorities should have power to fix a speed limit for motor vehicles in towns and villages, and that the courts have power to endorse the licence for a second offence.

THE Motor Manufacturing Company (1907), Ltd., will close their temporary works at Park Side, Coventry, on the 1st inst. for the purpose of removing the stock to the new M.M.C. works, Manor Street, Clapham, London, S.W., which will be in full swing in about a fortnight.

MR. J. W. STOCKS, in his recent run from London to the Edinburgh Motor Show, found the Dunlop metal non-skids on the rear wheels and the grooved pattern on the front wheels of his car gave great satisfaction and appeared at the end of the journey as though they would continue for an indefinite period.

THE Bridges and Roads Committee of the Kent County Council reported strongly to the County Council, last week, against the speed limit of twelve miles an hour recommended by the Motor Car Commission for towns and populous areas. They considered that the speed limit should be much lower in all such places.

A MAN named R. E. Stewart has been sentenced to three years' penal servitude at Preston for stealing a cheque-book from a motor garage. He bought a motor-car with a stolen cheque. Four years ago he received twelve months for stealing a motor-car at Northampton, and two years ago eighteen months, with police supervision, for stealing a motor-cycle at Ipswich.

REFERENCE was made in a recent issue to the large trade which had grown up, concurrently with the spread of the automobile movement, in connection with the repair of motor tyres, and to the need of care on the part of motorists in seeing that they only entrust their commissions to firms capable of doing reliable work. Amongst the concerns in Scotland who are gradually building up a large business in connection with the retreading and relining of motor covers is the Caledonian Tyre Repairing Company, St. Enoch Square, Glasgow, who a few months ago carried out an excellent repair to a badly worn tyre we submitted to them. The cover in question, in addition to the rubber being worn almost to the canvas, had for some reason or another developed two nasty large holes, so bad that we practically considered it as entirely done for. Not so the Caledonian Company, however, who not only retreaded the cover but effected such a thorough repair that we almost failed to recognise it on its return. Although, owing to the somewhat severe weather, the car on which the tyre in question is fitted has not made a very big mileage lately, the cover is standing up to its work excellently, and gives promise of having re-entered on a long and useful career.

LADIES are to be admitted to the lectures in motor engineering which commenced on Tuesday at the Technical Institute, Tunbridge Wells.

THE first British-built motor revolving fire ladder is being sent from the works of Messrs. J. Morris and Sons, at Salford, to Cape Town. It is mounted on a 40-50-h.p. petrol motor chassis and will extend to 90ft. in height.

SIR WILLIAM EDEN, Bart., has purchased a 40-h.p. six-cylinder Napier touring car.

THE Archbishop of Westminster has placed an order with the Daimler Company for one of their 1907 model cars.

A MOTOR fire engine is to be provided at Withington in order to increase the protection of South Manchester from fire.

THE motor-car garage at the Royal Mews, Piccadilly, cost £1,804, according to the Government Appropriation accounts just issued.

THE Doherty Motor Components, Ltd., Coventry, have just completed some further extensions to their factory by adding a department exclusively intended for presswork. Owing to the difficulty in obtaining skilled labour, the firm have devised several labour-saving tools, which are facilitating their output. The shops are all on the ground floor and splendidly lighted and ventilated.

A NEW frame for motor-cars has been introduced by Messrs. Barit and Gadenne, of Lille. It is made on the Lazerges system and is known as the *chassis semi-tubulaire*. As will be seen from the illustration, which shows a section of a side member, the

frame is a combination of the pressed steel and tubular types; at the bottom it is of channel section, but the top is bent over and rounded, then finally turned down and riveted to the side, the whole giving the appearance of an angle section surmounted by a tube. Long stiffeners set at an angle to the frame sides are provided, the whole forming, it is claimed, a lighter and stronger construction than the ordinary type.

COLONEL J. E. CAPPER, R.E., who is the head of the military ballooning department of the Army, stated in a lecture before the Aldershot Military Society last week that motor-driven aeroplanes would probably be seen in the near future in war as aerial scouts. It was probable that such a thing would make its debut this year, and that in five years' time considerable numbers would be employed.

LINCOLN will be well to the fore in the automobile movement this year, and the summer meeting of the Motor Union will attract a goodly number of motorists to the ancient city. Just now much local interest is being taken in the display of motor-cars which Messrs. R. M. Wright and Company have arranged in their Water Lane garage, where they have ample accommodation for a large number of cars.

WITH reference to the recent correspondence in our columns as to platinum tips in connection with electric horns, it is of interest to hear from Messrs. John Child Meredith, Ltd., of Birmingham, that they have been experimenting in the direction of finding a substitute for platinum. In this they have been successful, and are now placing on the market a special hard metal for contact tips which costs about one-sixth the price of platinum.

DESPITE the severe weather experienced during the first eleven days of the Long Distance Trial with a 40-h.p. Siddeley car which is being undertaken by the A.C.G.B.I., the car has made a splendid beginning of its arduous task. The roads, owing to the exceptional bad weather, have been extremely heavy in places, yet the car has run with unerring regularity, and at the close of last Saturday's run the distance covered was 1,628 miles. The "Elastes" filled tyres are reported to be giving an excellent account of themselves.

THE Kennedy Motor Company have removed from Cathcart to Eglington Toll, N.B.

MR. HALE, of Burslem, is acting as agent for the "Brown" car in the Staffordshire district.

LADY RODD has placed an order with Messrs. E. H. Bentall and Company, Heybridge, for one of their 16-h.p. landaulets.

At the last meeting of the Staffordshire County Council the clerk reported that 540 motor cars and 691 motor-cycles had been registered within their area.

THE conditions of the Scottish Trial will be issued shortly. The classification, which will be altered slightly from that of last year, will again be by price.

At Acton Vale the new works of Messrs. Panhard and Levassor present an example of modern workshop organisation and equipment the inspection of which would have been a liberal education to the engineer of a generation ago. They have the appearance of permanence, stone, steel, and concrete being prominent in their construction. In addition to the large showroom, extending the whole length of the main frontage, there are separate trading counters, from which spares, supplies, and parts will be retailed, while staff, clients', and executive entrances are all independent of each other and of the commodious offices. The tool equipment is more than one expects to find in a professed garage and repair works—it is

worthy of a constructing factory. Labour-lightening devices of all kinds are employed, and power is provided by two independent sources, the electricity for lighting, &c., being generated on the premises, while many of the tools are electrically driven. There are two long inspection pits of 150 ft. each, sunk in solid concrete, and capacious tool, smiths', body painting, varnishing, upholstering, and vulcanising shops, as well as a magneto room, coppersmiths' room for lamp work, and wheelwrights' shop. Alterations (including the Panhard body-lengthening process) overhauls and repairs to cars of any power or type are undertaken; in fact, Mr. W. A. Turpin, the works manager, need be only pleasurably concerned if he were asked to commence building cars! The greatest consideration for the staff's well-being is manifested in the provision of well-furnished kitchens, dining halls, recreation rooms, &c., and the accommodation for washing is practically unique. Everything, in fact, is provided for on progressive lines, and the working of every department has been so well organised that Messrs. Panhard and Levassor can undertake any overhauls or repairs.

THE annual conversazione of the Battersea Polytechnic was held on Saturday last, when the laboratories and workshops were all open for inspection. The equipment of the motor class now comprises a Darracq car, a four-cylinder Mors, and the chassis of a Clarkson steam vehicle, so that students are now able to receive instruction in both classes of automobile.

THE Camperdown Motor Works at Winchester Road Romsey, have opened a garage with Mr. H. Gill in charge.

A NEW garage and repairing works has been established at Balham Hill by the Waldorf Motor and Engineering Company.

THE MOTOR UNION would remind readers of the *M.C.J.* that Monday next is the last day for receiving essays on the coming Parliamentary struggle with regard to motoring legislation.

WALTON's motor lifeboat was out several days last week escorting the Ramsgate and Newhaven boats, which have been fitted with motor power and have been at Harwich on trial.

REPLYING to a question in the House of Commons on Monday Mr. John Burns said he was unable to make any statement as to the introduction of a Bill dealing with motor-cars.

FOREMOST among the motoring contributions in the weekly press must be regarded those which appear in the "Onlooker," these being informative and accurate as well as good reading.

ON Tuesday last a motor-car show was opened in the Exhibition Buildings, York, by Earl Fitzwilliam, the collection of cars being the largest which has so far been seen in the cathedral city.

SIDNEY HONE, a motor-car driver, was charged at the Brighton Police Court on Monday with unlawfully causing the death of Mathias Medhurst last week. The hearing of the case has been adjourned to Monday next.

WE learn that Mr. Mawdsley Brooke, of Lowestoft, had originally intended to cross from Harwich to Amsterdam by the Berlin on the night she foundered, but at the last moment had to delay his journey till two days later.

MR. L. H. BARNES, of the Highways Protection League, which has offices at 7, Fig Tree Court, Temple, E.C., is preparing a petition for presentation to Parliament praying for legislation restraining motorists from driving recklessly.

A MOTOR works that will employ five hundred men was opened on Saturday at Crossens, a little village near Southport, at the mouth of the Ribble. The Mayor of the town and members of the Corporation were present at a dinner given by the firm—the Vulcan Motor Company—in the evening.

THE third annual smoking concert of Messrs. Friswell, Ltd., took place at the Albany Hotel, Great Portland Street, N.W., when Mr. F. Guy Lewin (director), of Messrs. Friswell (1906) took the chair, being supported by Messrs. Chamberlain, Allen J. Owen, and J. Taylor. Under the direction of Mr. Harry Cramer everything went with a swing.

A COVENTRY firm which is specialising on the production of radiators, bonnets, tanks, lubricators, and other necessary petrol engine accessories, is the Coventry Motor Fittings Company. Under the guidance of Mr. Tyler we recently had an opportunity of going over the well-arranged factory, and were much interested in seeing the different types of radiators—honeycomb and gilled tube—in process of manufacture. The range of patterns in both forms of cooler is an extensive one, as practically every firm now employs a distinctive shape as well as its own pattern of bonnet. So far, however, the firm have been able to meet all requirements in this direction; and, to ensure that their production shall give satisfactory results in practice, the radiators before being sent out are all given a lengthy test for leakage, water being circulated through them by a hydraulic pump.

THE patent speed and mileage recorder invented by Mr. Henry Hartley, of Birmingham, and of which we shall publish a description in an early issue, is an ingenious and successful effort to secure a combination of advantages that will appeal to every practical motorist. By the use of this instrument the driver of a car can learn the time taken by each mile travelled, as well as the total length of his journey. The duration of every stop is recorded—a point that gives Mr. Hartley's indicator an advantage likely to be appreciated by owners of trade delivery vans. More than that, the instrument can be adjusted so as operate at any given maximum of speed, thus warning the driver should he go beyond the limit allowed. The means by which these results are obtained are simple and reliable, while the absence of complications will ensure accuracy and durability.

CORRESPONDENCE

[Letters to the Editor should be addressed to the office,
87-88, Charing Cross Road, W.C.]

CLUB GARAGES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your "Comments" of your issue of February 23rd you mention the Derby Motor Club's doings as regards club garages. It may be of interest to some of your readers to know that we have incorporated a garage, workshop and club-room with our club from its commencement, three months ago. In fact, the great desirability of a garage and workshop from the local motorists' point of view prompted the starting of a club providing such accommodation. I enclose a circular which was distributed amongst such motorists as were interested, and, although we cannot claim to have got ideal premises, they have already in their incomplete state proved a great boon to many members. Garage for approximately two cars or four tri-cars and about half a dozen motor-bicycles is provided, and although the demand for temporary storage will greatly increase with the coming of the season, our twenty-five motoring members have found it quite sufficient so far. The workshop at present only comprises a good sound bench, vices and bench drill, with the usual hand tools and a portable forge, but these will be greatly supplemented as

disadvantage of the coil and accumulator. It was to gain some definite knowledge as to this that I decided upon carrying out these experiments. I took an ordinary 40-h.p. six-cylinder Napier engine with synchronised ignition. The engine had just been delivered to the testing department and could in no sense be said to be either tuned up or specially arranged to demonstrate any one point. The motor was started up and allowed to run for some time so that an even temperature might be obtained, and so have general road conditions present.

The engine was fitted with a standard coil adjusted as in ordinary practice, run off an accumulator showing 4.2 on the voltmeter. When everything was ready to commence the motor was run and the horse-power taken for a period of two minutes. It developed an average of 40.9-h.p. over that period. The next test was made with a special coil, but the same accumulator was used—in other words, the conditions, other than the coil, were identical. This time the engine gave 42.5-b.h.p. In another test that was made the same coil was employed, but six volts were used to work it; the trembler blade remained the same and 42-h.p. was developed in place of the 42.5 previously. Subsequently the same coil and six volts were employed, but the trembler blade was adjusted lightly. The result was precisely the same as regards b.h.p., i.e., 42 was registered. In the next test the trembler blade was adjusted a little more heavily and eight volts were used to run the coil. The result in b.h.p. was 42.6. Later ten volts were used. The adjustment of the trembler blade remained the same, and the h.p. registered was 42. Afterwards four volts were used, with the trembler blade adjusted the same, and 42.2-h.p. was recorded; when the trembler blade was adjusted a little more lightly, four volts being used, the record was 42.1-h.p. In the last test the standard coil was replaced and an accumulator showing

A Motor Instruction School at Grafenhausen, Holland.

[D: Auto.]

soon as pressure of business allows. The advantages of a really good garage and workshop can hardly be understated, but briefly it gives the motorist a splendid opportunity of thoroughly understanding his machine and making experiments and alterations, and doing quite extensive repairs himself (we have not yet been able to afford a permanent mechanic.) As I mentioned before, we also have a club room, where nearly all the motor weeklies are provided, and once a fortnight a lecture or debate on various subjects of general interest. Therefore, I think other clubs will be doing well in considering the advisability of the provision of a garage.—Yours truly,

R. K. HUBBARD, *Hon. Sec.*

Basingstoke and District Motor Club.

[The circular enclosed by Mr. Hubbard refers to the premises in Mark Lane, London Street, Basingstoke, and gives evidence of a carefully considered scheme.]

EXPERIMENTS WITH ACCUMULATOR AND COIL IGNITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I recently had some rather interesting experiments carried out in connection with the much-vexed question of ignition on cars, and am sending you the results in the hope that they may be found useful. There has been a lot of discussion as to the great advantage of the fierceness of the spark increasing on magneto engines as the engine speed rises, so that as ignition theoretically became more difficult, the spark is more powerful, with beneficial results to the running of the motor; this has always been rather considered as an advantage of the magneto and a

4.2 volts was fixed up; the horse-power registered was 42. The idea in going back to the standard coil with small voltage and special coil with small voltage again was to see whether any alteration had taken place in the engine itself. As will be noticed, the horse-power still remained approximately 42.

The tests show that the horse-power varied very slightly from 42-b.h.p., no matter what the voltage was, or whether the trembler blade was adjusted lightly or heavily. The main point that was noticed, however, was that with the lower voltage the engine would run with a spark very much advanced; in other words, for a given speed the motor commenced to knock with less advance with a high voltage sooner than with the lower voltage, and it looks on the face of it as if nothing were gained by having a fiercer spark than that obtained from a good, healthy four-volt accumulator, except that the engine will run faster with less advance, but as it is not a very laborious process to advance the ignition a little more, and as it conceivably may even be an advantage that an engine did not really knock in the hands of a novice, the advantages of a very fierce spark would almost fall to the ground.

The engine was not altered in any shape or form during the tests, except with regard to the ignition, as indicated. Possibly there might have been combinations of carburation and ignition that would have been better allied with each other, but had any alteration been made to the carburettor it would have complicated the result and made it not so clear. It is certainly a very interesting point, and it would be useful to have the views of others on this much-vexed question. The point, in a nutshell, is that the power could not be increased by exploding the mixture with a hotter spark. The only thing that seemed to alter was the degree the spark could be advanced—in other words,

the same power could be obtained with less advance—the horse power remaining practically constant.—Yours truly,

S. F. EDGE.

SUBSTITUTES FOR PETROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reference to "Borneo's" letter on the above subject, in the last issue of the *M.C.J.*, I have found a "stubborn" engine start easily on Borneo spirit when a piece of coarse linen has been placed over the air intake. A handkerchief will do. It should be placed singly across the mouth of the pipe and twisted up at the back to keep it in position while turning the handle, the friction of the air passing through the cloth being sufficient to warm it. The handkerchief should, of course, be removed when the engine is under way. I may also mention that in my car, a 10-12-h.p. Peugeot, I screwed the jet up about 1-16th inch so that no Borneo flowed though the jet of its own accord.—Yours truly,

HERBERT J. CHAPMAN.

ANOTHER INGREDIENT OF "CARBONACEOUS" DEPOSITS IN ENGINE CYLINDERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Noticing in one of your contemporaries an article on the prevention of carbon deposits, I send you copy of a letter which I wrote some months ago, but did not publish.

VERB I have been interested in examining the deposits formed on the piston and cylinder heads of several motor-cars, and was astonished to find that in many cases these deposits contained a far larger proportion of mineral matter than of carbon. In one case a friend used five gallons of a certain oil which only contained mineral matter equal to 0.01 per

Touring in Sicily.—The Marine Promenade, Palermo.

cent., and yet, after he had finished the whole five gallons, he collected from his cylinders almost a one ounce weight of so-called carbonaceous deposit, which amount did not represent the whole of the deposit, as a complete collection was practically impossible. Now this ounce of deposit, on analysis, showed the presence of just over 0.75 oz. of mineral matter, largely of a silicious composition, whereas 0.01 per cent. of five gallons of the oil only means 0.07 oz. Therefore the difference, i.e., 0.68 oz. of mineral matter, must have come from some external source.

The only conclusion that I can arrive at is that some of the dust, which necessarily is drawn into the cylinders at each suction stroke, is caught by the film or oil as on a fly paper, and so gradually accumulates, forming, with the help of the carbonisation which also occurs, a hard cake. Further, I have found that in the summer this proportion of mineral matter to carbon is greater than in winter, when there is less dust. And further, it is noticeable, with an oil that carbonises badly, the proportion of carbon is much greater in comparison with that of the mineral matter.—Yours truly,

A. DUCKHAM.

IS THE LEATHER-FACED CONE CLUTCH DOOMED?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is with much regret that I notice a tendency amongst motor-car manufacturers to substitute metal clutches for our old friend the leather-faced cone. I say old friend, for, after some experience with the multiple disc type, I must say that the new-comer is not without its troubles, and I, for one, plump for leather, as being the one most suitable for the motorist of moderate means. To my mind, the reason why the metal clutch has been so largely adopted is merely a question of fashion, the fact that the — car is fitted with them being sufficient to cause other makers to follow the example, so that they may appear to be keeping abreast of the times. The leather-faced cone

clutch may sometimes be fierce, and at others slip owing to the presence of grease on its surface. But, after all, the remedy is not very difficult to apply. The subject is one which interests me very much, and I should be glad if other motorists would, with your permission, air their views on the matter in the always interesting correspondence columns of the *M.C.J.*—Yours truly,

F. C. BURTON.

FOUR v. SIX CYLINDERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with interest the report of the discussion on the four *versus* six-cylinder question at the Automobile Club, and, if you will allow me, I should like to make some remarks thereon. As a manufacturer, my sole aim is the progress of "Automobilism," and this is the reason why I am taking the trouble to comment on the matter, believing, at the same time, in the survival of the fittest. No doubt you have seen my challenge to compete against any six-cylinder car, at any place, under certain heads, these heads being:—

- (1) Quiet running of the engine when the car is standing.
- (2) Quiet and slow running of the engine on top gear.
- (3) Quick acceleration up to twenty miles per hour; top gear only to be used.

It is a condition of the trial that the standard gear of the respective vehicles shall be fitted. For my part, the 14-16-h.p. Argyll is made as a touring car, with only one gear ratio, and this can be easily proved, all parts being made interchangeable.

Now these are the points which the six-cylinder advocates claim to excel in, and it is an astounding fact that none of them have accepted my challenge. I agree that individual makers can hardly stem the tide of battle, and it certainly would be unwise of them to pin their colours to the mast, and fight for the four-cylinder principle, as if the six-cylinder idea was completely inimical to the best interests of automobilism; but I contend that, if the six-cylinder principle does not excel on the points I have challenged it on, then there is no reason for its existence, because:—

1. Given two engines of the same power, one six-cylinder and the other four-cylinder, the six-cylinder engine would be much heavier.
2. There are many more parts.
3. It is more difficult to keep in adjustment and keep running well.
4. There are more frictional losses.
5. It requires more lubricating oil.
6. Being a heavier engine, more load is thrown on the tyres.
7. It will use more petrol.
8. It is more costly to produce.

The public should be protected from this attempt which is being made to make the six-cylinder fashionable, until it is demonstrated beyond all doubt that they are getting a relative advantage from the increased cost of car, and the increased complication of the car after they have got it. I believe it will be possible for them to appreciate the difference in smooth running and vibration—with the aid of a stethoscope—but, for all ordinary mortals, and for ordinary purposes, believe me that, at any rate for engines up to 40-h.p., the six-cylinder principle is a bubble that will surely burst.—Yours truly,

A. GOVAN.

THE NON-SKID TRIALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The private non-skid trials held by the Automobile Club and the process of elimination adopted by that body seem to have left very few devices in for the final test. The result almost warrants the opinion that the methods adopted by the Club for the discovery of a successful non-skid device are not the best, and probably further trials may be necessary. It is hoped that if these are arranged they will be conducted on broader and more reasonable lines than the competition now partly concluded.

The idea of conducting these trials in a semi-private manner and on the premises of a private trading concern does not appeal to the general public as a good one. Why could not some well-known venue have been selected? There is no doubt that the immense influence of the Club is sufficiently great to have arranged for this. The rules in connection with the present trials leave too much in the hands of the Club or of the few members nominated to act in connection with the selection of devices to pass the preliminary test of examination of the drawings. Why could not a competition be arranged at, say, the Crystal Palace, where any device, the entrant paying for the privilege, could be entered and tried? The matter could be made sufficiently attractive to the public to bring a large number of visitors and the competition could be repeated daily for, say, six days. Prizes might be offered for the most successful device whose aggregate of marks for efficiency throughout the week's trial would reach the highest total.

Such a test would be much more conclusive than that made on a few yards of wood pavement at Ladbroke Grove. The Local Government Board and the police are probably anxious that some simple device may be found to attain the object desired, and would no doubt assist at such a trial. Let the competition be thrown thoroughly open without preliminary examination of drawings by a coterie of Club experts whose investigations are conducted in private and who are "not required to give any reason for elimination," *vide* the Club rules. No doubt the result, would well repay the experiment. The competition, if sufficiently open, might be made to pay all expenses, including the prizes, if some small

charge were made for admission. It is highly probable that the bus companies would interest themselves, and there is no doubt that sufficient entries could be made to guarantee a successful show.—Yours truly,
J. YARWOOD.

SMALL STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to Mr. Broughton's letter in the *M.C.J.* of the 9th ult. I can give my experience of a small steam car. First of all it cost considerably under £50; engine, Mason C superheater, steam, air and water pump, to seat two or four persons, paraffin fuel. With the above car I can climb any hill as easy as any petrol car. I have twice the power, the water consumption about thirty miles on one filling. There is no bucket work required, as I have a water lift fitted, with hose attached, and this can be put into a pond or trough, enabling the water supply to be thereby replenished in less than five minutes. The lighting up process is very simple—a small blow lamp—and steam can be raised in ten minutes. During that time the driver can be occupied in oiling up. Paraffin I purchase at 6d. per gallon, and twelve miles can be run on one gallon in the winter and naturally a longer distance when the roads are good. The car will stand any length of time without relighting. By having a steam air pump fitted no hand work is required; water pumping by hand I never have done on the road as the pump on engine is more than required, therefore I have the by-pass open quite a third of the time. Lubricants cost a mere trifle compared to a petrol car; having a mechanical lubricator fitted to feed the cylinders it requires half a pint of cylinder oil to fifty miles. My car being a second-hand one, I expected a lot of trouble; when I had done, during the bad weather, about 700 miles, I had a new vapourizer, at a cost of about 15s. I do about eighteen miles per hour. I cannot do more, the car having tiller steering and a short wheel base; steam is always well up and there is no smell; hills are nothing. If Mr. Broughton, or others, think of purchasing a second-hand car, my advice is to go in for a steamer and call on Messrs. Morris, of Stroud Green Road, N.; they might be able to find a car suitable, which they did for me, also tuition. I am in no way connected with the above firm, but have my repairs done through them. I might say there is no danger with fire on a steamer when paraffin is used for fuel; in fact, there is less than on a petrol car, as the pipe connections on a steamer are more secure.—Yours truly,

OXON.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to Major J. C. P. Perry's letter re small steam cars in the *M.C.J.* of February 16th, it would be interesting to hear of the writer's personal experience as to their reliability, life of boiler, &c. Does he consider them suitable for rough Irish roads?—Yours truly,
LYALL P. JACKSON.

WIRE OR WOODEN WHEELS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to your invitation to express an opinion as to the respective values of wire and wooden wheels, may I, as an owner of two cars fitted with these respective types of wheels, venture to express an opinion? Theoretically, no doubt, the wire wheel is as strong as the wooden one when the strain applied occurs in the same plane as the wheel, but when a side strain, such as skidding or knocking a kerb when rounding a corner too closely, happens, a compressing stress must occur, owing to the wheel not being absolutely rigid, and as a result the wheel buckles; not so in a wooden one, as the wood can clearly stand a much greater force of this kind than wire, although, of course, it has its limit. And I think, under all other circumstances, the wooden wheel compares more favourably with the wire wheel, especially as regards the matter of appearance, as undoubtedly it gives the car a smarter and more substantial appearance, and, judging from the number of artillery-wheeled cars on the road, it seems to be the opinion of most people in this respect.—Yours truly,

K. J. G.

THE SIX-CYLINDER DISCUSSION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Why is it a large number of people clamour for six cylinders? The question is not difficult to answer. Because they wish to be considered absolutely up-to-date, so that none of their friends can go one better! It was the same in the cycling days. People who could afford them had the most expensive machine, as they were quite sure that only the reasonably wealthy bought such a machine. It would have been such a blow to Lady M., for instance, to have found that her maid rode the same make of machine as herself, so *infra dig.* Now, if the six-cylinder car had not been cleverly boomed, and if those responsible for the boom had not a formidable list of titled patrons, we should all have been very contented with the four-cylinder. The public lose sight of the fact that, although the six-cylinder has some small advantages, they do not really want it, and if they were to consider the question carefully, they certainly would not pay an enormous extra for two more cylinders.

The increased price of the six-cylinder car is out of all proportion to the increased cost of manufacture, but this does not trouble a certain section of the public—not a bit of it. "Lord M.," they say, "has got one, that is good enough for us."

Then there is to be considered the extra trouble in connection with two extra cylinders. It is childish to say that this argument is used by six-cylinder opponents only, and that the extra trouble is grossly exaggerated. There is no getting away from the fact that the two extra cylinders contain four valves and two plugs. And there are also the necessary additions to the ignition. Do we get valve troubles and ignition troubles on four-cylinder engines? Sometimes. Therefore we are just as liable to get them on the six-cylinder, only there is a little more field for them. Those interested in the sale of six-cylindered cars explain all this, at the same time drawing attention to the fact that with the six-cylinder, should one cylinder fail, you have five to go on with, instead of three in the case of a four-cylinder. Quite so; a sort of "reductio ad infinitum" which reminds the writer of a new car (not yet built) which for the same reason will have forty-two cylinders! But that is another story.—Yours truly,

A. C. R.

MOTORING RECORDS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Nearly three years ago I bought an 18-h.p. Star car. To-day, and somewhat to my regret, I am parting with her. It will, I am sure, interest you to hear that she has carried myself and members of my family 13,223 miles without a single failure on the road other than, of course, temporary adjustments, and that only very rarely. The car has been in constant use the whole time excepting for one brief period, when I had new piston rings fitted; this, and one coat of varnish on the body, has been my total cost for repairs. The vehicle is still quiet running, speedy, and develops good power, and I am told by the fitter who

A Plain Tale of the Road.

examined gear, &c., that all is in capital condition, no loose bearings, in fact, no necessity for taking down to overhaul.

Of course the car has been well looked after, particularly the body washing and lubrication, and has always been driven by myself or by my son. My tyre bill has been particularly small, and you will be astonished to hear that the near front wheel has the original cover still on and same has never been punctured. The car still looks bright and smart and works as smoothly as some of the newer designs, and, had the body a side entrance, I would on no account dispose of her.—Yours truly,

E. W. HILL.

A CHANGE-SPEED GEAR TROUBLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Would you or any reader of the *M.C.J.* advise me what to do respecting the low gear pinion of a 12-16-h.p. Peugeot car? I am constantly fitting a new low pinion, as they wear down in a very short time. On climbing a hill using the low gear it grinds and makes a noise, this sometimes also when starting on the level; when I look at this gear it is quite worn away, the others are perfect.

The gear-box is a very large one and I think is inclined to spring. Perhaps you could recommend some method to make this gear more perfect and last longer.—Yours truly,

PERFECT PINION.

THE STANDARDISATION OF NUTS.—Mr. C. R. Garrard writes:—"Referring to my letter in the last issue of the *M.C.J.*, the range of pitches should have read from .75 mm. pitch to 2 mm. pitch (not 1½ and 2). Thus the five pitches used are: .75 mm., 1 mm., 1.25 mm., 1.50 mm. and 2.0 mm."

THE French Motor Accessories Company, Ltd., 101, Gray's Inn Road, London, W.C., write that their show rooms have been broken into and a certain amount of goods stolen. Amongst those taken were several dozen voltmeters and volt-ammeters, all of which were marked "Perez." If any of our readers are offered any such so marked, otherwise than through their usual agent, the firm will be grateful of a notification of the fact.

CLUBS AND ASSOCIATIONS.

THE MOTOR UNION.

THERE was a large attendance at the February meeting of the General Committee of the Motor Union. The bodies represented included the A.C.G.B.I., twenty-five provincial clubs, the Motor Van, Wagon, and Omnibus Users' Association, the Auto-cycle Club, and the individual members of the Union. The Hon. Arthur Stanley, M.P., presided.

The committee unanimously approved the suggested agreement between the Motor Union and the Auto-cycle Club, which had been drawn up by the representatives of the Union and the A.C.C. The scheme provides for the admission of motor-cycle clubs to the membership of the Union on payment of a very moderate affiliation fee.

Forty-two applications for legal advice and assistance were dealt with, in one of which the Union undertook the entire cost of a prosecution. The Union decided to seek information as to the practice of some County Councils in demanding the renewal of driving licences on the 1st of January in each year, and the payment of a fresh fee of 5s., without regard to the date on which the licence is taken out.

It was resolved to object to the making of ten-mile speed limits at Llandudno and Ilford.

The committee authorised the holding of a competition, offering prizes amounting to £12 for the best artistic design for the Motor Union Almanac.

The Knox 35-40-h.p. Service Car recently put in operation by the Fire Brigade of Springfield, Mass., U.S.A. The vehicle is fitted with a four-cylinder air-cooled engine.

A number of special signboards were ordered to be erected upon the highway to indicate "Concealed Turnings" and "Schools"; applications for these boards should be made to the secretary, at 1, Albemarle Street, W.

Two new clubs joined the Union during the month—the Westmorland A.C. and the Manchester Motor Club.

The Fuels Committee of the Motor Union have met weekly during the month of February under the chairmanship of Dr. H. S. Hele-Shaw, F.R.S. The following gentlemen have attended the meetings of the committee, and have given valuable evidence as to the supply, distribution, and consumption of petroleum spirit:—Mr. Philip Tennant, managing director of the Gas Lighting Improvement Company, Ltd.; Mr. F. P. S. Harris, of the Asiatic Petroleum Company, Ltd.; Mr. R. Bell, engineer of the London Motor Omnibus Company, Ltd. The information given by all these witnesses was of a confidential character and will be valuable to the committee in preparing their report and framing their recommendations.

HARROGATE.

At a meeting of the Harrogate A.C. on Thursday of last week Dr. Holroyd read a paper on "The car of the future, steam or petrol," in which he declared in favour of the steam vehicle, remarking that their demands were for power, comfort, flexibility, and last, but not least, cheapness of running and maintenance. There was a type of car which came very near, if not altogether up to their requirements, and that was the steam car. The cause of steam had suffered on account of the early experimental cars introduced into this country, and he believed that, in

the future, it would come to its own again. He was prepared to assert that once a man had driven a good steam car he was not eager to return to the petrol vehicle. He gave the credit for silence and reliability to the steam car, which was also easier to control. On the question of cost of running and maintenance Dr. Holroyd mentioned the rise in the cost of petrol that had occurred within the last year, and said that the steam car required a less costly fuel.

Mr. T. S. Watney opened a discussion on the merits of petrol and steam cars, and an interesting evening was spent by the members of this active club.

HERTFORDSHIRE.

THE Hertfordshire County Automobile Club will open its season on the 22nd inst. with a reception at the Corn Exchange, Watford. An interesting programme of fixtures for the coming season has been prepared, the two principal features being the open hill-climbs—one, on April 13th, for motor-cycles; and the Aston hill-climb for cars only, which, this year, will take place on July 6th. The conditions for both of these events are now in the press and will be obtainable in the course of a few days from the hon. sec., Mr. W. Whittall, Darley Dale, Watford.

The following gentlemen have recently been elected to membership of the club:—Messrs. J. Lindsay (Hertford), J. B. Wellington (Elstree), F. J. Jenkins (Ealing), J. Howard (Chesham), H. McLatchie (Harpenden), A. Tidd (Colney Heath), S. Spoor (Putney), and R. Nisbet (Watford). The representatives of the club on the General Committee of the Motor Union for 1907 are:—Messrs. E. Webster, J. S. Harwood, T. Williams, and W. Whittall.

WELSH.

THE third annual general meeting of the Welsh Automobile Club was held at the Tenby Hotel on the 21st ult., when there was a good attendance of members. The report and balance-sheet were adopted, the President, in moving their adoption, remarking on the very valuable work performed by the committee during the year.

The report draws the attention of members to the proposed arrangement regarding the dust-proofing of the Mumbles road—a beautiful stretch running round Swansea Bay for a distance of five miles and a very favourite promenade in summer. The committee are in touch with the Glamorganshire County Council Roads and Bridges Committee and have made them an offer of £100 towards the total cost, estimated at £300, for doing the work. It is expected that it will be put in hand in April. Mr. Basil Valentin was elected president for the year. The retiring president, Mr. F. Cory Yeo, announced his intention of presenting the club with a 20-guinea challenge cup to be competed for as the committee decides. Captain Hughes-Morgan, of Brecon, has also announced his intention of presenting the club with a challenge cup. Mr. S. L. Gregor was re-elected hon. secretary and Mr. H. G. Davies re-elected hon. treasurer. Twelve new members were elected, which brings the membership up to 125.

AUTO-CYCLE CLUB.

THE committee has decided to present a special gold medal to any affiliated club having a motor-cycle membership of not less than forty, such medal to be put up for any competition the committee of the affiliated club may think fit. It has been decided that the destination for the twenty-four hours' ride shall be Plymouth. A start will be made, probably from Hounslow, on Friday, July 26th, the whole journey there and back having to be completed within the twenty-four hours.

For the International Auto-Cycle Tourist Trophy race a fuel limit has been fixed of one gallon for every ninety miles of the course, for the purpose of reducing the speed. Each machine must be a *bona-fide* touring machine. The latest date for receiving entries is Tuesday, May 14th.

NORTH-EAST LANCASHIRE A.C.

THE members of the North-East Lancashire Automobile Club have had a lecture by Mr. Leveson Scarth. Up to the time of railways an ancient Greek or Roman could travel as quickly as an Englishman. Throughout English history, from the first recorded use of wheels by King John to the present day use of motor carriages by King Edward VII., movement on the roads has been limited by the paces of a horse, which has set a constant rate of ten miles an hour, or the mean speed maintained by a coach-and-four under favourable conditions on a long journey. Even the cyclist has only increased the speed to twelve miles an hour. Into this placid, slow-pacing world the motor-car has entered with a rush. Whenever the speed limit was abolished there would be no observable quickening in the general pace of motor-cars. Drivers would move then, as now, at a pace which agreed from moment to moment with the safety of the public and the circumstances of the road.

SOUTH WALES AND MONMOUTHSHIRE A.C.

THE annual dinner of the South Wales and Monmouthshire Automobile Club was held at the Park Hotel, Cardiff, on Saturday. Dr. E. Tenison Collins was in the chair, and amongst others present were Messrs. W. Rees Jeffreys, J. L. Wheatley (town clerk), J. Arthur Jones, Principal Griffiths, Messrs. G. A. Phillips (county surveyor of Glamorgan), Wm. McKenzie (head constable of Cardiff), J. J. Neale,

F. C. Shackel, E. Nicholl, V. E. Brukewich, J. J. Handcock, J. Thompson Willows (hon. secretary), W. Parker Thomas, Gibbon, Brooks, Dryden Lewis, C. Russell Gray, H. West, R. Clay, and D. K. Roberts.

Mr. E. Nicholl proposed the toast of "The city of Cardiff," Messrs. J. L. Wheatley and J. A. Jones responding.

Principal Griffiths proposed "The Automobile Club and the Motor Union." He thought they should rejoice at the probable postponement of motor legislation, for the public prejudice against automobilism was decreasing. The development of the automobile would supply the means of scattering our population and relieve the density which we now suffered. The motor-omnibus would be the future vehicle of the public, and for that reason if he were a member of the corporation he would be unwilling to spend a penny more than held legal on electric tramways. He noticed that the popular outcry against the motor-car always subsided in the winter and rose again in the summer. The public had realised that they were not in danger from it, that it was a safer vehicle than the ordinary horse-drawn vehicle. The whole of the public prejudice against the motor-car was due to the nuisance which they must admit was caused by the dust they lifted.

Mr. Rees Jeffreys responded. He said the longer they waited the more satisfactory was the next legislation likely to be. The next Act would probably be a permanent measure, and, therefore, must be well considered. They intended to introduce a Motor Union badge, which it was intended should be the badge of the considerate driver.

SCOTTISH MOTOR TRADE ASSOCIATION.

THE business proceedings connected with the Scottish Motor Trade Association have taken place in Edinburgh, where the general meeting of the organisation was held. The annual report disclosed that the Association was in a flourishing condition. The principal officials appointed were:—President, Mr. Thomas Shaw, Dundee; vice-president, Mr. John Love, Kirkcaldy.

Mr. Shaw presided at the supper during the Show week, when Mr. J. S. Matthew, Glasgow, proposing the toast of "The Association," said he thought he voiced the opinion of the trade when he said that in Scotland one Association should be ample. Mr. Shaw hoped that every member of the motor trade in Scotland would rally round the Association, and make it a power in Scotland.

OWING to the pressure on our space the report of the paper read by Mr. A. Towler to the Yorkshire A.C. on Tuesday is unavoidably held over.

THE Wirral and District Automobile Club has been formed, with Mr. J. A. Satterfield Hassal, of Graham Road, West Kirby, Cheshire, as secretary.

ON Sunday the North West London Motor Cycle Club held its opening run to Redbourn. Mr. H. V. Davidson, 22, Olive Road, Cricklewood, N.W., is the hon. secretary.

THE Bristol and Gloucestershire A.C., which will hold its annual meeting at the Royal Hotel, College Green, Bristol, on the 13th inst., has arranged for the provision of a motor house for its members.

AUTO-CYCLE CLUB'S SILENCER COMPETITION.

ON Tuesday the Silencer trials organised by the Auto-Cycle Club were commenced at the Notting Hill works of the Clement-Talbot Company. Only nine entries were received, and of these three were to the credit of Sharpe's Patents Company, Ltd., 58, Fleet Street, E.C. These were (1) the "Universal" silencer, consisting of a cylinder containing two bulbs connected together, which act as an expansion chamber. The exhaust passes out of the end of the second bulb into the cylinder, and finally enters the open at the top end through a number of small holes. (2) the "Universal-Paragon" silencer, with similar action, except that the expansion chamber consists of an inside cylinder; and (3) the "Universal Victoria" silencer, consisting of two bulbs, with a pipe running down centre with a stop equi-distant from each end of both bulbs. The exhaust enters the pipe and goes into the bulb through a number of small holes, again entering the pipe through a further number of similar holes, and goes into the second bulb, when the same action takes place, the exhaust finally reaching the open through holes in the end of the pipe.

Mr. G. Aldington, 50, Haydon's Park Road, Wimbledon, S.W., entered the "Silent" Silencer, in which a cylindrical expansion chamber is encircled by an outer cylinder, into which the exhaust passes. This outer cylinder is filled with a number of aluminum balls, breaking up the exhaust, which finally reaches the open through a number of small holes in end of silencer. The same competitor also entered the "Aldington's Combined Silencer, Footrests, and Footwarmer," which is constructed of steel tubing, 1½ in. diameter, so as to form the foot-rests of a machine. The tube answers as an expansion chamber, and near each end is an aluminium box shaped to the foot, into which the exhaust passes, when passing into the open through a number of small holes. The heat is regulated by means of a disc worked by the rider's foot.

The "Radio" silencer was in the name of Messrs. Wood and Co., Cavendish Street, Ashton-under-Lyne, their speciality comprising a number of tubes, radiating the heat quickly, and owing to the combined length of tubes a perfect scavenging of cylinder is effected at every

stroke. Messrs. Montgomery and Co., Ensign Cycle Works, Bury St. Edmunds, had their "Montgomery" Silencer, consisting of a cylindrical expansion chamber, encircled by coils, in the form of a double spiral. The exhaust enters the spiral at the bottom of the cylinder and passes into the open by means of small holes drilled in the coils throughout their length. Another competitor was Mr. Wm. McAuslane, Appleby, Westmoreland, who had the "Wat-Not" Silencer, consisting of a cylinder divided into six sections. Down the centre of the cylinder passes a pipe, also in six sections overlapping each other, so that the end one is much smaller than the first. As the exhaust passes down this pipe, a proportion of it escapes at each overlap into the respective sections, and finally reaches the open through small holes in the walls of the cylinder. Messrs. Collier and Son were also competitors.

In connection with the test a 3½-h.p. engine was fixed to a bench, and connected with the exhaust was a three-way piece, at one end of which a silencer was fixed as a standard, control by a shut-off cock. The remaining end was open, for connecting the silencer to be tested. Between the two silencers and the engine a pressure gauge was fixed, which registered the back pressure resistance given by the tested silencers. A brake was fixed on the flywheel of the engine, loaded with a weight of about 7 kilos, and the engine was run with this constant brake pressure, at a uniform speed of 1,500 revolutions a minute. The actual difference of noise with each silencer was obtained with a Hughes audiometer. Colonel Holden, who was in charge of the trial, and Messrs. J. Lyons Sampson, B. Chatterton, and A. Sharp, the judges, put each silencer to exactly the same test; and the report of their investigations will be made known in a few days.

A CHARGE OF MANSLAUGHTER.

THE Leeds Stipendiary Magistrate concluded on the 21st ult. the hearing of a charge of manslaughter arising out of a motor smash last

Mr. T. Scott-Foster, of Southsea, at the wheel of his 28-36-h.p. Daimler Car

August. The accused was Mr. H. S. Atkinson, motor-car dealer, of Albion Street, Leeds, and the man killed was the driver in charge of a horse and cart, with which the motor-car collided. Mr. H. F. Atter (from the Town Clerk's office) prosecuted, and the accused was represented by Mr. E. O. Simpson. The evidence for the prosecution having been given, the formal charge was read over to the accused, who replied "Not guilty." Mr. Simpson submitted that it was a case which ought not to be sent for trial. He argued that on the evidence before the court no jury would be likely to hold the accused responsible for the accident. As a matter of fact, the evidence went to show that the mischief was caused by the cart coming down the wrong side of the road and colliding with the motor-car. The magistrate said that, in his opinion, it was a question of speed. Was the accused travelling at an improper rate of speed? If the answer were in the affirmative, the question arose—"If he had been driving at a reasonable and proper speed, would the injuries to the persons concerned have been caused?" The accused was committed for trial at the next Leeds Assizes, bail being allowed.

THE EVIDENCE OF A SPEEDOMETER.

ROBERT CHAMBERLAIN, a chauffeur, was summoned, before Mr. Marsham, at Bow Street (London) Police Court, for driving a motor-car in St. James's Park at a greater rate than the regulation limit of ten miles an hour. Mr. Staplee Firth appeared for the defendant. According to the evidence of Park-keeper Gould and two of his colleagues, the defendant drove a motor-car containing Mr. McCall, K.C., in Birdcage Walk at a rate exceeding eighteen miles an hour. The defendant was

called, and said the park-keepers had made a great mistake, as his speedometer showed that when he was stopped his car was travelling at less than ten miles an hour. Mr. McCall, K.C., gave evidence to the same effect. On the occasion referred to in the summons he (Mr. McCall) was watching the speedometer carefully, and was sure that it did not register ten miles an hour. It was pulled up within its own length when the park-keeper signalled, and that would have been impossible had it been travelling at the rate alleged by the park-keepers. He saw two motor-cars going at a much more rapid pace than his was, and a hansom cab passed his car at the railing near Buckingham Palace. Mr. Firth submitted that the park-keepers lost time when signalling to each other, and had over-estimated the speed at which the defendant was driving his car. Mr. Marsham said the park-keepers' watches had been tested, and he did not think there had been the error suggested. The defendant would be fined 40s. and 2s. costs. Mr. McCall was said to feel very strongly on the matter, and intended to appeal against the magistrate's decision.

OBSTRUCTING A MOTORIST.

THOMAS FROUD, of Brunswick Street, Blackfriars, appeared before Mr. Marsham, at Bow Street, London, for not keeping a van, of which he was the driver, on the near side of the road to allow the free passage of a motor-car. Earl Russell (counsel to the Automobile Association) stated that on the afternoon of the 15th ult. he was driving a motor-car along Kingsway towards Holborn. When he reached the entrance to the underground tramway, in the centre of the road, he had to pull up because a van, of which the defendant was in charge, was being driven close to the obstruction. He sounded his hooter, and someone in the van shouted, "Do you want all the road?" The witness again sounded his hooter, but the defendant refused to pull in to the near side, although there was no traffic to prevent him doing so. Owing to the defendant's conduct the witness was obstructed for a distance of about 100 yards. He then called a policeman, and told the defendant that he would be summoned. The defendant said he tried to pull in to the near side, but was unable to do so, as the road was very greasy. There was ample room for Earl Russell's car to pass him on the near side. Mr. Marsham said it was a great inconvenience to motorists to be delayed in this manner. The defendant ought to have given way, and he would be fined 10s., and 2s. costs.

PUBLIC MOTOR SERVICES.

FOOT GONGS instead of motor-horns as a means of warning are being tried by the London Road Car Company on their motor-omnibuses now in operation in the Metropolis.

A NEW motor-bus service will soon be at work in Torquay with steam-buses that have hitherto done duty at Llangollen, in the place of those that have been removed to Harrogate.

A MOTOR-BUS driver has been fined 5s. and costs at the Lambeth Police Court for loitering—or, as the police termed it, "driving very slowly" at Camberwell Green.

SIX motor-cars are to be acquired by the newly formed Motor Transport Proprietary, Ltd., of 395, Collins Street, Melbourne, for general hire and passenger work in that colonial city.

A MOVEMENT is being projected locally to establish a motor-car service between Hawick and Jedburgh, and Kelso and Jedburgh.

THE Cardiff Watch Committee has been considering the question of licensing motor-buses to run in the district. Three applications have been received for permission to run motor-buses, one from the old Cardiff Tramways Company, for the substitution of motor vehicles for their present horse-buses from North Road to Whitechurch, and from Castle Street to Llandaff; one from a projected new company, to be called the Cardiff and District Motor-Bus Company; and the third from Mr. E. Allen, of Penarth, for a new motor service between Penarth and Cardiff. After a long discussion it was decided to reply to the application of the Cardiff Tramways Company that, having regard to the safety of the public, the corporation could not see their way clear to grant licences for motor-buses to run along the existing routes, but that licences be granted for motor-buses in substitution for all present licences for horse-buses, provided that the buses shall not ply within the city, except so far as the tramway terminus in Cathedral Road, or, if the company preferred, as far as the junction of Severn Road and Cowbridge Road, and also from North Road towards Whitechurch. With respect to the application of the projected Cardiff and District Motor-Bus Company, it was decided that, considering the facilities already provided and the safety of the public and the congested state of the streets, the corporation could not see its way clear to grant the licence asked for. The application from Mr. Allen, of Penarth, was dealt with in the same way.

AFTER one successful season the Island Motor Omnibus Company was in the unfortunate position at its annual meeting just held to report a deficit of £3,323 on the second year's working. The principal factors accounting for the large increase in expenditure are the larger number of omnibuses during the busy season, charge for depreciation, and exceptionally heavy charges for compensation for damage and legal expenses. The gross earnings decreased by £1,742 15s. 6d., although the omnibuses had covered an additional 19,000 miles in the Isle of Wight during 1906.

THE directors of the London General Omnibus Company, in their report for the half-year ended December 31st, report that the amount standing to the credit of the motor fund on June 30th last was £22,523. During the half-year £9,168 had been spent on garages. The directors propose a dividend at the rate of 5 per cent. per annum.

CASES UNDER THE MOTOR-CAR ACT.

A QUARTETTE OF SUMMONSES.

At Woolwich, William James Fox, of King Street, Hammersmith, was summoned, before Mr. Baggallay, on four summonses. The first was for driving a motor-car without being licensed at Woolwich Road, Charlton, on February 2nd; secondly, for being the owner of the car and not registering his change of address; thirdly, for driving the car in a manner dangerous to the public; and lastly, for not stopping when requested by the police to do so. Police-Sergeant 18 R stated that the defendant was travelling, in his opinion, 25 miles an hour, and declined to stop. Witness blew his whistle and a constable further up the road put his hands up for the defendant to stop, but he steered past him. He was subsequently traced by the number of his car. Mr. Baggallay imposed a fine of £5 for driving to the danger of the public, £5 for failing to stop when requested, and 5s. each on the other two summonses, with 8s. costs.

RECKLESS DRIVING.

The magistrates sitting in the Church Police Court have fined Walter Crute, a chauffeur in the employ of Messrs. Worthington, £10 and costs. The charge against him was that he drove a motor-car to the danger of the public. The prosecution gave the Bench a description of the car, which is the shape of a bottle and weighs two tons. On the 7th ult. Crute was driving it along the Burnley road towards Accrington. A lorry was coming in the opposite direction, and from behind that vehicle a coal cart turned right in front of the motor. Trying to avoid a collision, Crute ran into the side of a house. A large hole was made in the wall, the fireplace was damaged, and a cupboard was smashed. The chairman of the Bench said that accidents of this kind were becoming too frequent. Motorists, seeing a clear road in front of them, were unprepared for anything suddenly getting into their track. If a child had suddenly rushed from one of the houses and the driver had failed to avoid a collision, it might have been killed. Leave to appeal was granted.

At Woolwich, Herbert John Silver, Islington, was summoned for driving a motor-car at a dangerous speed in Woolwich Road, Charlton, on February 2nd. Defendant, who was driving a car with 12 cwt. of newspapers, said the car could not travel twenty-five miles an hour. He was fined £5 and 2s. costs.

William Phillips was summoned for a similar offence at the same time and place. It was stated that he was certainly travelling over twenty miles an hour. He was also carrying newspapers. Mr. Hutton said people were in a hurry to get the papers, and he supposed the defendant was driving quickly to supply his customers. Defendant admitted that he was travelling sixteen to eighteen miles an hour. A fine of £5 and 2s. costs was inflicted.

ALLEGED RECKLESS DRIVING.

At the Yealmpton Petty Sessions a youth engaged as a chauffeur by Mr. Williams, of Old Town Street, Plymouth, has been summoned for driving a motor-car recklessly in the parish of Plympton. Mr. Pearce explained that he appeared nominally for the police, but really for Mr. Gilbert Popplestone, who laid the information. The prosecution was taken under section 1 of the Motor Act, 1903. The facts were that on January 19th, about 6.20 p.m., Mr. Popplestone and his groom were returning after a day's hunting to Plymouth, coming along the Plymouth road and going across the bridge at Plympton. When on the bridge they saw two lights rapidly advancing towards them. They did not hear the horn, and they had barely got off the bridge when the car passed them very close. Mr. Popplestone and his groom shouted loudly, and the car swerved as it passed them with less than a foot margin. The car was on the wrong side of the road, and he submitted that it constituted a grave danger. It passed on without the occupants paying any attention to the shouting of Mr. Popplestone and his groom. The former regarded his escape as a miraculous one. Mr. Ward, for the defence, submitted that the vehicle was under control, and the Bench dismissed the case.

At Brighton Mr. Clifford Earp has been summoned for riding a motor-cycle at a dangerous speed on the King's Road on the 3rd ult. Mr. Louis Meaden appeared for the defendant and pleaded guilty on his behalf. He (Mr. Meaden) thought his licence would have been sent on, but it had not arrived. That, however, need not prevent the Bench making an order, as it was an offence not to produce the licence within a reasonable time after conviction. The magistrates decided to adjourn the case for a week for the production of the licence, and the attendance of the defendant.

MOTOR-BUS ACCIDENT.

AN alarming collision between a motor-omnibus and an automobile occurred on Sunday afternoon at Westminster. One of Tilling's motor-buses, which ran from Peckham to Oxford Circus, had rounded the corner of Bridge Street into Parliament Street, and was proceeding towards Trafalgar Square, when it came into collision with a motor-car which was running in the opposite direction. The impact was so great that the panes of glass in the omnibus were smashed to fragments, and a lady and gentleman passenger were badly cut and bruised. The occupants of the motor-car, however, escaped injury.

A FURTHER repeat order to tyre fifty-four wheels for the War Office has been received by the Sirdar Rubber Company, Ltd.

THE MANCHESTER MOTOR-CAR SHOW.

THE second of the motor-car exhibitions in Manchester during the present season was opened on Friday last week in St. James's Hall, the organisers in this case being the Manchester Motor Trades Association. The show comprises a very complete selection of pleasure cars, but the exhibits of commercial vehicles are confined to one or two light vans and lorries. One of the largest stands is that of Messrs. Newton and Bennett, Ltd., comprising as it does examples of the Napier, Fiat, Belsize, Clement, Rover, and Enfield. Before the show is closed they hope also to have on view a new Italian vehicle, known as the S.C.A.T., and built by the Società Ceirano Automobili, of Turin, but at the time of our visit the car had not arrived. It is of 16-20-h.p., and is provided with a four-cylinder engine, 90 mm. bore by 120 mm. stroke. The clutch is of the multiple disc type, and the transmission through a gate-controlled change-speed gear and cardan shaft to a live axle. The Renault and Talbot cars are to be seen at the stand of Messrs. Joseph Cockshott and Co., Ltd., a notable feature being the bodywork, which is the production of the firm's own factories. Darracq, Humber, and Singer cars are staged by Mr. T. Garner, Manchester. The Bolton Motor Car Company, Ltd., display the Adams-Hewitt and Humber cars, notable among the latter being a 30-h.p. single landaulet. In addition to a full range of motor accessories, Messrs. Brown Bros., Ltd., exhibit examples of the Brown 35-40-h.p. six-cylinder, 25-30-h.p., 20-22-h.p., and 18-20-h.p. four-cylinder cars. The Mercedes, Berliet and Panhard cars are shown by Messrs. J. A. Lawton and Co., Messrs. Andrew Allen and Co., Manchester, and the Commercial Motor Company, Leeds, the Lancashire and Yorkshire agents respectively, jointly show a series of new cars made by the British United Engineering Company. The largest is of 32-36-h.p. and is fitted with a double landaulet body. The four-cylinder engine is provided with both high tension magneto and accumulator ignition; the four speeds forward and

acetylene lamps and the system of lighting by means of dissolved acetylene. Motor oils and greases are shown by Price's Patent Candle Company, Ltd., Messrs. John S. Morris and Son, the Auto-Lubrine Company, Messrs. E. Brooksbank and Co., Ltd., and Messrs. Marshall and Co., Moseley. The tyre exhibits include the Elastes, Continental, Dunlop, Gaulois, Dook-Swain, Moseley, Macintosh, and Shrewsbury and Challiner. The Dook-Swain Tyre Company have a novelty in a non-bursting inner tube, the rubber being covered with a special canvas woven to the inflated dimension of the tube before the ends of the latter are vulcanised together. The show closes to-day (Saturday).

COMPANY NEWS.

NEW COMPANIES REGISTERED.

BERKELEY MOTOR COMPANY.—£10,000. To adopt an agreement with Mr. H. S. W. Pennington.

E. D. HEINEMANN.—£10,500. To adopt an agreement with Mr. E. D. Heinemann and Mr. S. O. Heinemann, and to manufacture and deal in motor-cars and other conveyances, &c. E. D. Heinemann is managing director, and may retain office while holding 3,090 shares. 26, Cranley Mews, South Kensington, S.W.

"ARGYLL MOTORS" (CONTINENTAL).—£16,000. To adopt an agreement with Mr. A. Leicester for the acquisition of his interest in a concession granted to him by Argyll Motors, Ltd. 17, Newman Street, W.

TARMACISER.—£3,012. To acquire (when granted) certain patents of Mr. R. Ames for inventions for treating roads with heated tar. First directors: Messrs. R. Ames, H. Beadle, and H. Wettern. 7, Victoria Street, S.W.

LLANDUDNO MOTOR AND GARAGE COMPANY.—£5,000. First directors: Messrs. J. J. Wooler, W. E. Watson, and W. Broomfield. Argyll Road, Llandudno.

A General View of the Manchester Show.

a reverse are controlled by a "gate" lever, and the final transmission is by a cardan shaft to a live axle. A 16-20-h.p. car and a 35 cwt. lorry with side chain drive are also on view. Messrs. Humber, Ltd., show examples of both the Beeston and Coventry Humber cars; the Wolseley Tool and Motor-car Company, Ltd., exhibit a range of the Wolseley-Siddeley vehicles, including a 45-h.p. six-cylinder chassis. The display of Belsize Motors, Ltd., includes a 60-h.p. six-cylinder chassis, and examples of the 20-h.p. and 30-h.p. vehicles, and that of the Daimler Motor Company, Ltd., comprises a 28-45-h.p. car with "Kenilworth" body, and a 30-55-h.p. limousine. The Central Motor Garage, Blackpool, show the Weigel and Sunbeam cars; the Hollindrake Automobile Company, Ltd., Stockport, the Clement-Talbot and De la Buire; Messrs. McNeil Hutchison Company, the Cottareau; Messrs. Horsfall and Bickham, the Horbick; and Argylls Manchester, Ltd., the Argyll. Other exhibitors of cars include Mr. J. Robertson, Rusholme, Manchester, the Lanchester Motor Company, the Eclipse Machine Company, Ltd. (Rothwell cars), Mr. R. Ramsbottom (Cadillac and Gladiator), Messrs. Bell Brothers (Bell), Mr. G. W. Lowcock (Simms-Welbeck), Mr. H. A. Timberlake, Wigan (Vulcan), Iris Cars, Ltd. (Iris), Messrs. J. E. Hutton and Company, Ltd. (Panhard, Mercedes, and Berliet), Mr. F. Wilkinson (Stanley steam cars), the British Automobile Commercial Syndicate (Spyker), the Manchester Motor Company (Ford and Deasy cars).

The exhibitors in the accessory section include Messrs. S. Smith and Sons, Ltd. (speed and mileage indicators), the New Motor and General Rubber Company, London (rubber and metal non-skids), Messrs. Meade-King, Robinson and Co. (Giant motor spirit), Mr. W. Cort, Market Harborough (Cort's detachable non-skids), the County Chemical Company, Ltd. (vulcanisers, oils, greases, carbide, etc.), and Pettett's Safety Filler Company (safety filler for emptying petrol from tins to tanks). Messrs. Joseph Cockshott and Co., Ltd., draw attention to the Rushmore

COMPANY MEETINGS.

ELASTES COMPANY, LTD.—The first ordinary general, or statutory, meeting of the Elastes Company, Ltd., was held at 78 and 80, York Street, Westminster, S.W., Lieutenant A. Trevor Dawson, R.N., presiding. The secretary (Mr. W. J. H. Moll) read the notice convening the meeting and the auditors' report. The Chairman said that manufacture of Elastes in this country had now been started and orders were steadily increasing. Elastes was an unqualified success, as they had numerous unsolicited testimonials which bore out the claim that Elastes, in addition to overcoming the bugbear of punctures and burst tyres, in spite of its first cost, proves an economy in reducing the item of tyres in motor-car upkeep, which undoubtedly was the most serious one motor-car users have to face. It had been definitely proved by some of the leading motor-car manufacturers that, provided the car was efficiently sprung and balanced, the Elastes tyres could be applied to give equal results in regard to resiliency and smoothness in running as with the pneumatic tyres. As a personal instance of such efficiency, he stated that he had himself ridden in a motor-car which had run over 5,000 miles on one set of Elastes filled tyres, and the running of the car was equal to the running of an ordinary car on pneumatics. Major F. Lindsay Lloyd, R.E. (manager and director), said after seeing the merits of Elastes he introduced it to the notice of the War Office Mechanical Transport Committee with the object of having it applied to military motor-cars. The manufacture was commenced at Erith on January 15th last. There was one thing they were very pleased to notice, and that was the growing use among all classes of motor vehicles of the movable rim, which, although it is not an essential to Elastes, makes the application of the substance much easier for the owner, as it will not be necessary for him to dismount his wheel to have Elastes fitted to it. The movable rim itself, or the spare rim, was simply sent to the mounting room and the Elastes filled tyre was

mounted there without any inconvenience to the owner of the car. A vote of thanks to the chairman concluded the proceedings.

MOTOR UNION INSURANCE COMPANY, LTD.—The first statutory meeting of the shareholders of the Motor Union Insurance Company, Ltd., was held at 1, Albemarle Street, W., on Monday. Mr. C. H. Dodd, chairman of the board of directors, and vice-chairman of the Motor Union, presided, and, in moving the adoption of the report, said that though the company had received their certificate enabling them to commence business in November last, they did not begin to issue policies until the 1st of January, and the business which had been done had exceeded the most sanguine expectations of the directors. Mr. Dodd went on to speak of the policies issued by the company. The special Motor Union policy had been very favourably received, and he thought it must be generally admitted that it marked a great advance upon any policy of motor insurance which had hitherto been issued. In settling the terms of the policy, the directors had endeavoured as far as possible to make it perfectly clear and free from those irritating exceptions and restrictions which had been such a prominent feature in many motor insurance policies in the past. They had aimed at simplicity combined with the fullest cover which could reasonably be given. Already the directors had seen their way to improve the terms of the Motor Union policy in many particulars and without addition to the existing scale of premiums. They had, for instance, decided that damage to rubber tyres should be covered in the event of an accident in which some other portion of the car was damaged. The directors had also decided to cover tools against theft or damage which might occur at the time of an accident to the car, to cover all damage to cars done by lightning, and, perhaps most important of all, to extend the cover of those owners who insured against personal accident to accidents which they might sustain when driving or being driven in any motor-car not used for public hire. The intention of the directors was also to devise a scheme by which some share of the profits might be divided amongst the policy holders who did not make claims, such share of the profits being applied towards the payment of future premiums. The motion was duly seconded and carried, and a formal vote of thanks passed to the chairman.

ROAD REPORTS.

STIRLINGSHIRE.—Eleven roads in the county have been closed to motor-car traffic by order of the Secretary for Scotland, and fifty-nine other roads are affected by a new speed limit order.

STONEBRIDGE.—Success seems to have attended the experimental road surface recently laid near Stonebridge, on the road from Coleshill to Coventry. Although on a recent day all the neighbouring roads were muddy, both the experimental surfaces—the one tarred, the other consisting of blast furnace slag impregnated with tar—were quite free from potential dust and side-slip mixture.

HORSHAM.—Pending the result of the tests about to be made in connection with treating the roads with tar, the Horsham Rural District Council has decided to suspend further action in the matter so that the best methods may be adopted.

SOUTHPORT.—Mr. Tronson, of Southport, has been in communication with some motorists at Liverpool with a view to taking up the question of shortening the road from Liverpool to Southport. This, he says, can be done very considerably, but the interest of the ground landlords will have to be secured to do it cheaply. He has announced that there was a scheme in hand to lay a special track for motorists at Southport.

THE DANGERS OF THE ROAD.

As the result of an accident, the death took place, in Sussex County Hospital at Brighton, on Sunday, of a young man named Medhurst. He and his brother were cycling to Brighton, and near Clayton Hill met a motor-car driven by Mr. Sidney Holmes, of Oxford Mansions, London. Medhurst was caught by the car and flung over it into the air. He was picked up unconscious by the occupants of the car and taken in another vehicle to Brighton, where he died.

While a party of motorists from West Hoathley were descending a hill at Lindfield on Saturday, a pony and trap, containing an hotel-keeper and his wife, named Card, were making an ascent when the pony got frightened and plunged across the road. To avoid a collision the chauffeur turned the motor into a ditch. The car, however, struck the trap, and Mr. and Mrs. Card were thrown into the road. The motoring party escaped without serious injury, but it was several hours before the motor was removed from the ditch.

COMMITTED FOR TRIAL.

The Slough magistrates have heard a charge of manslaughter against Edward Maurice Harrison, chauffeur to Mr. Redfern Russell, of Oxford. On the morning of January 27th prisoner was driving his employer and Mr. F. H. Goodhart, from Oxford to Slough. At the latter place the car ran into an elderly man named William Hawkins, who was crossing the roadway, and who died shortly after as the result of the accident. George Martin said the car was going slower than the G.W.R. 'bus, and Dr. Adams said deceased was suffering from double cataract, and his hearing was bad. The Bench sent Harrison for trial at the Bucks Assizes, admitting him to bail.

BUSINESS NEWS.

CAPTAIN THEO MASUI, who went to India last November in order to introduce the German car to that country, is now on his way back after having had a very successful business tour. The car on which he made his non-stop run from Bombay to Agra has been purchased by Major Warren, of the Commander-in-Chief's Staff, who is an authority on motoring in India; a duplicate of the vehicle has also been purchased by the Maharajah of Balrampur, whilst a large number of orders have been received from various parts of the Peninsula.

LORD HOWARD DE WALDEN has just placed an order with the Motor Supply Company, Ltd., for a 45-h.p. six-cylinder Siddeley, which will be fitted with a limousine body.

MR. J. THOMAS, of Cardiff, has fitted up the Wyndham Mews, in that town, as a motor garage. His showrooms at Cowbridge Road, Cardiff, will be continued.

MESSRS. GROSE, LTD., have just fitted a motor cover with its fourth leather band, and frequently fit two or three of their non-skid bands to the same cover before it is worn out.

MR. EDWARD KENNARD, who has been a consistent user of Napier cars since he purchased the first one that was built, finds that his repairs for six years averaged under £11 annually for a total distance of 36,000 miles.

MR. C. FONTEYN, 78, Newman Street, London, W., has acquired the British agency for M. Jules Cury Fils, of Deville, Ardennes, France, manufacturers of castings for motor cylinders, pistons, &c.

THE E.I.C. Company, of Sampson Road, Birmingham, have recently been making extensive alterations to their premises. In addition to fitting two 30-h.p. National gas engines, they have established a laboratory where all materials will be tested before being passed into the works for manufacture. They have also made some important additions to their testing shop, and as a general result of these improvements will now guarantee all their manufactures for two years.

MESSRS. ALFRED HERBERT, LTD., of Coventry, have issued a catalogue descriptive of their combination turret lathes.

SIR THOMAS PILKINGTON, Bart., has recently acquired a Hotchkiss car from the London and Parisian Motor Co., Ltd.

THE DUCHESS OF PORTLAND is one of the most recent purchasers of Iris cars, her Grace having ordered a 25-h.p. chassis to be fitted with limousine body.

THE Daimler Company are making good progress with their export trade, an order having just been cabled from Soerabaija, Java, for a "Milverton" pattern, 45-h.p. Daimler car, the first of a series which have been arranged for in this country during the coming season.

CLIMAX MOTORS, LTD., Coventry, inform us that they have now completed their arrangements for the manufacture of Dixon's metal cone clutch, of which an illustrated description was given in the *M.C.J.* of November 17th last, and that they are now in a position to supply it promptly.

THE Daimler Motor Company have sent us a photograph which serves to show the usefulness of the petrol motor. Owing to the recent frost the cement foundation of the floor of an extension of the works, at Coventry, had not set as quickly as was desired, as it was necessary to move into this particular shop at a certain date. Luckily the heating apparatus had just been installed, which consisted of large fans in the roof which blow air over steam radiators and deliver it on to the shop floor through sheet-iron pipes. These fans were ready to run, but the electric power destined to drive them had not been installed. Nothing daunted, the engineers hastily fixed up some old car motors on test-stands, with the result that the cement set in time to enable the shop to be used at the desired time.

A **MOTORIST** who has driven a West-Aster car more than 5,000 miles writes that he has done so at a cost of only 10s. for repairs or replacements.

At the **Edinburgh Motor Show**, which closed on Saturday, about 34 per cent. of the motor-cars exhibited were fitted with Continental tyres.

MESSRS. FRISWELL, LTD., write that they are desirous, in view of recent movements and statements made in the daily press, of pointing out that their firm may justly lay claim to the title of "England's First and Foremost Motor Auctioneers." They first promoted this class of auction business on February 7th, 1901, and inaugurated the weekly sales on Thursdays, and have periodically held auctions in various parts of the country for firm standing stock and motor-bus service. Their premises have been repeatedly increased until they now cover an area of 46,000 superficial feet, and they can provide for the storage of 800 cars.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

THE Motor-Car Journal.

VOL. IX.]

LONDON, SATURDAY, MARCH 9, 1907.

[No. 418.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

MOTOR-CARS are responsible for many new problems, and even some of the steamship companies are having to consider the coming of the car as it affects their special business. Motorists touring with their cars require attention from the great ocean liners, and although we do not anticipate they need establish garages with exercising tracks, so that drivers may keep their hand upon the wheel, they will certainly

have to provide for the conveyance of cars without crates. Many Americans who tour in England and on the Continent with their cars have found that the system of packing cars in crates has many disadvantages, vehicles being scratched and marred to a far greater degree than when they are merely shipped in a way that has become the custom in Europe. Here automobiles are simply hoisted aboard vessels by means of suitable tackle and let down on to the main deck of the ship. They are then secured in a convenient corner, covered with tarpaulin, and taken from the vessel without damage—a condition of things that does not usually follow crate shipment on an Atlantic liner.

The Police and Motorists.

DOUBTLESS a grave sense of official etiquette was responsible for the expressed inability of the Home Secretary to answer a question addressed to him by Mr. Luddell in the House of Commons on Tuesday. Following up a question as to a summons dismissed at the West London Police-court for driving a motor-car at an excessive speed, he asked Mr. Gladstone what would be done to compensate motorists in case of false charges made against them by the police. The response was that the question could not be answered—a vague form of comment. It revealed a state of things that only motorists can appreciate. The difficulties of obtaining costs against the police even when cases are dismissed are known to all our readers. To secure compensation for loss of time and disturbance to business caused by having to appear to answer charges that have little basis in fact is even more impossible; but the matter should not be overlooked by friends of the movement in Parliament.

The Hooded Van Danger.

A READY response has been received to the inquiries of the Motor Union respecting the use of hooded vans. Particulars have been received in regard to a large number of towns and counties. From these it seems that there are four towns in which there is a by-law in operation—viz., Liverpool, Wolverhampton, Bristol, and Cardiff, while at Bristol the by-law is not rigidly enforced. In Scotland the hooded van is comparatively little known, and in consequence a by-law is said to be unnecessary. In some of the districts from which information comes it is stated that a by-law is "very necessary," while in others the majority of hooded vans comply with the London County Council regulation, which enacts that a vehicle shall be

so constructed that the driver shall have in front and on each side of the vehicle an uninterrupted view of the traffic. The Berkshire County Council, it seems, will not take up the matter until various boroughs have done so. At Hereford and Coventry the police favour such a by-law, and in Essex the County A.C. is approaching the Chief Constable on the subject. It is apparent, therefore, that concerted action is necessary to effect the removal of the danger attached to the vans so constructed that the driver cannot see the overtaking traffic. Steps, indeed, should be taken without delay, as the hooded van claims many victims. A case in point occurred at Burnley recently. Two little boys coming out from school were run over and killed by a cart with a sheet down one side, which prevented the driver from having a view of the traffic. The coroner pointed out this fact when summing up the evidence for the jury. Motorists and others should therefore continue to press their local councils to adopt suitable by-laws.

The Sussex A.C.

NOT often do motorists require prompting towards organisation, but we really feel the advantages of combination are not sufficiently appreciated by many of the owners of cars resident in the county of Sussex. The whole area enjoys a notoriety throughout the country so far as police vigilance and magisterial prejudice is concerned, and there is still much to be done to convince local authorities with regard to the desire of drivers to live at peace with all men. Why, then, should the club have to record a slight decline in its membership? The question need not be unduly pressed, but we would ask all motorists in the county not yet in association to join the Sussex A.C., and give it numerical as well as financial support. The presence of strong, active clubs in areas of opposition has a good effect, and in such a county as Sussex the need for such an organisation is very urgent.

The British Industry.

EARL FITZWILLIAM, in declaring the York motor show open, made interesting reference to the prospects of the British automobile industry, which is finding a "local habitation and a name" in the county of broad acres. He rightly attributed to the excellence of the work of our mechanics some of the great progress that has been made. Other countries had obtained the lead, but the British engineer was making considerable advance, and soon the contest will be, if it is not already so, on more equal terms than was the case a few years ago. All this is good news to the industrial workers of the country, who are adapting themselves to a new industry that promises to expand in a very healthy way.

Where Motor Works are Located.

MOTOR works will loom large in the Census of Production that will shortly be taken by Mr. Llewellyn Smith, who has been appointed by the Board of Trade to carry recent legislation on that subject into actual operation. Already the widespread nature of the industry is apparent to those who attend exhibitions or study the advertising pages of the motor

B

Press. London and Manchester are regarded as the chief markets for the motor-car, but there are scores of places in the country interested in the sale of cars whose aggregate swells into a considerable volume. Apart from the selling aspect, the manufacturing importance of the industry is widely distributed, and a writer in the "Manchester Guardian" mentions that about the Metropolis are thirty works, four specialising on heavy commercial vehicles. Essex has three factories, Kent three, Surrey five, Hampshire three—all for the production of commercial vehicles, Berkshire three, Lincolnshire five, Lancashire fourteen, Warwickshire twenty-eight, and Yorkshire eight. Around Glasgow there are eight works actively engaged in the production of automobiles. These figures are only approximate, but they do not exaggerate the present position of the industry, which is certainly expanding in a way that must be gratifying to all anxious about the national prosperity. Many of these works are quite new, and their existence has set flowing a flood of activity in many directions where stagnation was threatening the future. Emphasis may rightly be placed upon this view of things, so that the Labour members in the House of Commons will readily see that the development of automobilism means more avenues of employment to workmen of every grade.

A snapshot on the Quay at Boulogne.—Cars awaiting shipment to England.

Is a Motor Driver a Labourer?

IN the course of an action heard at Marylebone by Sir William Selfe and a jury on Tuesday, an important point as to the position of the motor driver with regard to the Employers' Liability Act was raised. A motor-bus driver sued the London General Omnibus Co. for damage under the Act in respect of a broken arm. The plaintiff was starting a vehicle when the engine back-fired, and the handle he was holding flew backwards and broke his arm in two places. For the defendant company it was submitted that the accident was due to the driver's unskilful use of the lever and that the motor was in perfect order just before and just after the mishap. His Honour left to the jury the question of deciding on the evidence whether they considered a motor-bus driver a manual labourer, in view of the many brakes and control levers he had to manipulate in driving a vehicle of that kind. The jury found that the plaintiff was a manual labourer, and judgment was accordingly entered for the defendants.

The Motor Union and Bridge Tolls.

This was reported in our last issue. The Bench hold that, applying the Acts of Parliament dealing with light locomotives on the highways to the Hayling Bridge Act, the maximum toll

fixed by that Act for a locomotive under two tons weight apparently equalled the toll for a carriage drawn by one horse, the sum being ninepence, whereas the toll in the schedule to the lease was fixed at threepence. There was no other sum in the schedule to the lease which corresponded with the toll in Section 64 of the Bridge Act, the tolls in that section being the maximum, whereas those in the schedule to the lease were the minimum. The defendant had produced no evidence, as required in the lease, authorising him to collect any greater toll than threepence for a carriage. The magistrates were of opinion that in the absence of proof of any such consent from the lessors, the defendant had no authority to demand or collect from the complainant any greater toll than threepence each way for passing his motor-car over the bridge. They were not called on to say what was a fair toll to be demanded. Judgment would, therefore, be entered for the complainant for sixpence, the amount overpaid on each of the two days complained of, with costs, and £2 2s. solicitor's fee. We congratulate the Motor Union.

Motor-bus Services.

ONE result of the avidity with which enterprising companies rushed into the public arena with their motor-buses, before the latter were quite ready for commercial success, is seen in the position of some of the concerns interested in London traffic problems. Of the eight companies formed to run motor-buses only two have proved profitable to their shareholders up to the present, while the London General and the Road Car companies, though carrying considerably more passengers than they did in the days when the horse had the monopoly, have found expenses rising beyond anything to which they were hitherto accustomed. Some of the more cautious men in the bus trade of the metropolis advised caution in introducing the mechanical vehicle on to the streets, and had their experience been followed we should not have had the rush which has occurred, and which has had the effect of depreciating the passenger traffic companies in the eyes of the public. It must be confessed that the position is hardly satisfactory, and that rigorous organisation will have to be encouraged if the companies are all to emerge from the present chaos.

Motoring in Manxland.

EVIDENTLY there is enthusiasm among the motorists of the Isle of Man, whose number is steadily advancing. The Manxland Automobile Club has now its official organ, published, as those responsible modestly say, "at irregular intervals, when occasion requires, and when the editors find leisure." To this members are invited to contribute, and those who go to Cordingley's Motor Show in London are specially invited to forward notes on the novelties they see. We also note that the club is open to ladies as well as to gentlemen. Mr. G. Drinkwater is president, Mr. Gillmore treasurer and editor, and Mr. Douglas Everard secretary of the club, which has twenty-three resident car and motor-cycle owners in membership, as well as half a dozen other resident members, and thirty-five who do not reside in the island. It is gratifying to see the efforts of the club to awaken local authorities to a sense of their responsibility with regard to the roads of the island, for upon these much of its prosperity depends.

The Tourist Trophy Race.

OUR readers in Manxland will be interested in the fact that there are so far thirty entries for the International Tourist Trophy Race, the full list now comprising the following cars:—Rolls-Royce, Darracq (2), Berliet (2), James and Browne, Arrol-Johnston (2), Metallurgique, Thornycroft, Scout, Coventry-Humber, Beeston-Humber, Star (2), West (2), Gregoire (2), Vulcan, Clement, Gladiator, Rover (2) Hillman-Coatalen, Vici, New Leader, Vinot, Aries, Daimler-Mercedes. For the International Heavy Touring Car Race there are now

fourteen entries, which may be summarised as follows:—Siddeley (2), Beeston-Humber, Berliet (2), Gladiator (2), Armstrong-Whitworth (2), New Arrol-Johnston, Aries, Straker-Squire "C.S.B.," Ariel (2). From what we hear interest is also being whetted in the Tourist Trophy Race for Small Cars to be instituted next year. This will complete the opportunities for the testing of every description of motor-car on our roads.

Motor-Car and Relief Work.

WHEN the recent earthquake occurred in Jamaica we were able to publish some interesting news with regard to British motorists who were then on the island. Previously, in our issue of November 10th, reference had been made to the delightful roads in Jamaica, and the regulations under which motor-cars were allowed on the roads, the Jamaica Motor Union being mentioned as willing to render good service. Now we are able to present our readers with illustrations showing the devastation caused by the event, and also to demonstrate the service which the motor-car was able to render in the relief of the sufferings of the wounded. Dr. Bacon sailed from New York for Jamaica by the first boat that left after the earthquake, and lent his aid to the local doctors. On a White steam car he was conveyed to the mountain districts, which had been left without much medical assistance, as nearly every doctor had gone to Kingston. The

The Earthquake in Jamaica.—A Motor Car in the Relief Service.

car carried the Red Cross flags, and from many a wayside hut victims of the disaster were brought out for medical aid. After touring the country districts Dr. Bacon visited Kingston, from whence a scheme of rendering service throughout the island was matured.

Jamaica.

WHEN the urgent calls of the first few days had been attended to some reflections on the state of the island became possible. Dr. Bacon learned that Mr. Victor Camp's White steam car, in which he travelled, had covered over 10,000 miles in Jamaica on one set of tyres—a tribute to the roads of the place, seeing that an equally long distance was yet expected to be travelled. As regards the destruction wrought by the earthquake, it should be stated that it was mainly confined to Kingston, some appearance of the ruin of which may be gleaned from the reproduction of photographs for which we are indebted to Mr. Frederic Coleman.

Motor-cars v. Motor-cyclists.

AN interesting point in connection with the relations on the road between drivers of motor-cars and motor-cyclists has been raised by Mr. W. E. Scarritt, chairman of the Committee of Public Safety of the Automobile Club of America. The silent running of the modern car is a factor of

somewhat dubious value as regards public safety; the whirr of the engine is a warning of the coming of the vehicle to pedestrians or others. But the position is intensified in the case of the motor-cyclist, whose machine has a music, as well as an occasional discord, of its own, overwhelming the slight indication of the presence of the car on the road. So that the motor-cyclist listening to the noise of his engine may be entirely deaf to the sound of cars rounding corners, or coming along suddenly from the rear. Inquiries among motor-cyclists prove that there is real danger in the point, and hence the appeal, that cannot too frequently be made, to motorists of all degrees to exercise caution and show consideration when on the road.

A Motorist on the Needful Policy.

IT was the serviceability of the motor-car in connection with Parliamentary elections that first induced Col. H. F. Bowles, of Enfield, to take up motoring. Now he continues its use because of its value in social circles and in making new neighbours. He began his motoring career with a car of small power and has added a Daimler vehicle. With regard to the driving and care of the car, he has come to the conclusion that a coachman who has an aptitude for machinery makes the best driver of an automobile, after a little training. Col. Bowles is not only an enthusiastic motorist for his own pleasure but

has associated himself with the North London A.C., of which he is the president, and his views on automobile policy are therefore of value as well as interest. He has just favoured us with his opinion to the effect that the motor tax ought to be ear-marked for the improvement of the roads. The whole regulation of our system of road making should be changed and it should be dealt with by a Government department. He believes that the car should be a certain height from the ground, and that the speed limit should vary. No danger signal ought to be passed at a rate exceeding ten miles an hour. His own County Council of Middlesex has put up a great many road signs, but they have not had the attention they should have had.

Stands at Shows.

AMONG the restrictions that are now forced upon the exhibitors at Olympia is that preventing freedom of individual taste in the display of their cars. This is in contradiction to the policy that prevails at the Agricultural Hall Exhibition, where each exhibitor will have opportunity for showing cars to the best advantage, according to his own ideas of catching the public eye. The result of this is that many exhibitors will be able to bring over the stands that have delighted the automobile world at the Paris Exhibition, and the forthcoming display will have the advantage of variety and brilliancy in the stands whereon will be shown many novelties for the season.

SOME REMARKS ON RADIATOR FANS.

BY A. E. S. CRAIG.

I DO not think that fans as auxiliary to the cooling system on automobiles have evolved to anything like that state of efficiency to which other parts of the mechanism have progressed. Considering that the mere fact of a fan being placed on a car is *prima facie* evidence the designer admits the cooling system would be deficient without it, and as, moreover, on the efficiency of the said cooling depends not only the satisfactory working of the car, but also the safety of the most expensive portion of its anatomy, I think it may be granted that the subject is one worthy of very serious attention. The question as to whether or not fans are necessary, except for quite small powers, I answer in the affirmative; because to do without them means depending on natural as against forced draught, and this involves carrying a much larger radiating surface and consequently much more weight than is otherwise requisite or desirable.

These premises being granted, we are faced with the questions as to the most efficient form of fan to adopt, and as to the most effective place to put it. In both cases we find much diversity of opinions, and, judging by many of the designs that one sees on lifting up engine bonnets, the propulsion of the car would appear to have in many cases absorbed all the best efforts of the designer.

consequence. No doubt all fan systems, except the Renault, offend in this respect; but I do not see that this matters much, for all the best modern motors have their cam gear, &c., duly encased in dust-proof and oil-retaining coverings, and there is every indication of future practice even enclosing the valve tappets and springs, &c. For myself, I like a draught past the engine, even at the risk of having to clean it occasionally, and certainly the best way of getting this draught is to place both the radiator and fan in front of the cylinders.

The question of the size and shape and number of blades for a fan is of great importance. Some fans are altogether too small in relation to the area of the cooler, and others have far too many blades. I am certainly of opinion that the fan should work in a hood the larger diameter of which is fitted behind the honeycomb or ribbed tubes and covering the entire area of the same and the other end of the hood surrounding the fan blades. I find that six blades are ample, and in a fan 15 in. diameter a parallel width of 2 in. gives excellent results. The blades should have a slight double curve like a flattened out S. A fan of this size should run at 1,500 revs. per minute or more, assuming the angle of approximately 45 deg., which is the best, be adhered to.

Whilst on the subject of fans it is perhaps within our province to discuss the various modes of driving them. It is, I consider, a great mistake to drive by positive gearing such as spur pinions, as it puts too much strain on them when the speed varies suddenly. And exposed gear wheels, which to my mind

The Earthquake in Jamaica.—Some of the Ruins at Kingston. (See page 21.)

Fortunately the majority at least have decided on the best position for the fan, and that is directly behind the radiator, and the latter, of course, directly in front of the chassis. I am aware that some very large and important firms put their fans as far away as they can get them, i.e.—in the flywheel under the dashboard, but they do so at the expense of efficiency. The reasons for this assertion I will cite as follows:—1st, because it involves combining the fan with the flywheel, the blades of the fan forming the spokes of the wheel, which militates against the design being as perfect as it should be. 2nd, because the action of the fan is impeded by being partly hidden by the crank chamber of the engine. 3rd, because the distance of the fan from the radiator, and the various intervening chances of air being sucked in, prevents the draught through the cooler being as fierce as it otherwise would be. 4th, because they can only be applied with any attempt at success to engines with large flywheels and of comparatively slow speed. When I speak of fans in the flywheel, I of course exclude those placed on the periphery thereof as coming under the objections numbers 1 and 2 cited above, and in the Renault system, in which the radiator is placed next to the dash, objection number 3 is wiped away. I consider, however, that in the Renault system the objections still remain that there is lost a lot of natural cooling effect by placing the radiator behind the engine, and also there is more or less stagnation of air around the cylinders.

Some people make a great outcry against the dust drawn in by fans, and point to the early destruction of the engines in

are an abhorrence, are also usually to be seen in connection with the same. The best method of driving a fan is by a belt, and the best form of belt is a helical spring. This has the following advantages—it takes up very little room, and has a good grip, which is automatically released if a sudden pull takes place. Failing this, I like a good flat belt with automatic tension arrangement such as is now fitted on a good many cars.

CLASSES for the instruction of mechanics, drivers and owners in motor-car engineering have been established at the Department of Applied Science of the Sheffield University, under the supervision of Mr. Alf. P. Hill, A.M.I.M.E. During this session Mr. Hill has arranged a series of visits to some of the largest motor works, and a party of about thirty-five students have visited the Daimler works at Coventry. To each five students a draughtsman was appointed as conductor, and the smallest details of construction were carefully explained. This admirable arrangement was carried out by Mr. C. Ridley, the works engineer, and the thanks of the party were cordially given to him and the firm for their extreme courtesy. Next month the students will visit the Humber works at Coventry, and afterwards those of the Sheffield Simplex Car Co. In the laboratory work of the classes much help has been given by manufacturers, amongst others being Messrs. Clement-Talbot, Argylls Ltd., and the Wolseley Co., the two latter having loaned complete four-cylinder chassis for demonstration purposes.

SOME CURRENT TOPICS.

The Importance of Good Compression.

Upon the perfection of the compression attained within the cylinders of a petrol engine depends to a very important degree the efficiency of its operation. A failure to attain and to hold the expected compression pressure is due to a lack of tightness of those elements which are supposed to confine the gases during this portion of the cycle—namely, the valves, the cylinder walls, head and passages, and the piston and its rings. Faulty compression acts in three ways to reduce the useful work developed. After the full charge has been drawn into the cylinder and the compression stroke commenced, a portion of the mixture leaks out either into the crank case or the exhaust pipe, or is forced

other parts of petrol cars has now been issued, and of which we give a summary below. Considering first the question of motor-car frames, M. Perissé shows that the pressed steel variety has made further progress during the past twelve months, the percentage having increased from only 46 per cent. in 1903 to 90 per cent. in 1906, the proportions of other types of frames being indicated in the subjoined table:—

Motor-car Frames.	1903. Per cent.	1904. Per cent.	1905. Per cent.	1906. Per cent.
Pressed Steel ...	46	76	82	90
Armoured Wood ...	32	16	14	10
Tabular ...	22	8	4	—

The Progress of the Metal-to-metal Clutch.

An interesting section of the return is that dealing with friction clutches, as it shows that although the metal-to-metal type is still advancing in favour, the progress is relatively a slow one, the leather-faced cone being still by far the most widely used. Thus, while last year 66 per cent. of the cars were fitted

H.M. the Amir of Afghanistan during his visit to India has enjoyed many motor trips. The above illustration depicts him returning from a tiger shoot at Laashkeer, Gwalior, on H.H. Maharaja Scindia's Fiat Car. The Amir is seated at the side of Sir Henry McMahon, while the Maharaja is at the wheel.

back into the admission pipe, and by the time ignition takes place there is a considerably reduced amount of fuel within the cylinder. The condition is, in effect, as if a partly throttled charge instead of a full charge had been admitted, although in point of fact a full charge of fuel has been expended. When such leaky conditions obtain, not only is the initial pressure upon explosion abnormally low, but a certain proportion of the expanded gases escape prematurely through the leaks and reduce the working pressure at an excessive rate, rendering the useful pressure upon the piston during the later portion of the stroke much lower than it should be.

More Technical Statistics.

In a recent issue we gave some extracts from the interesting technical statistics of the petrol motors at the Paris Salon, compiled by M. L. Perissé. A further series of figures dealing with

with the latter, the proportion is now 64 per cent., metal clutches having advanced in the same period from 34 per cent. to 36 per cent.; so that M. Perissé's anticipation, expressed at the beginning of 1906, that "by the end of the present year the metal variety will outnumber the leather-faced cone type," has not been realised.

A LITTLE brochure entitled "Automobile Formalities in France" has been issued by the makers of the Hotchkiss car. The booklet gives the particulars of the forms and formalities to be observed in placing a motor-car in commission anywhere in the French Republic. It outlines the process to obtain a driver's licence, the declaration at the office of the prefecture of police, matter of declaration for taxation purposes, the details of insurance, various points regarding speed limits, and many helpful hints particularly applicable to motorists who intend to tour abroad.

THE REGENT CAR.

A CAR which is steadily gaining in popularity is the 18-h.p. Regent which was put on the market a year or so ago by Messrs. S. F. Edge, Ltd., to meet the growing demand for an easy and silent running vehicle at a moderate price. The principal features of the car have already been dealt with in the *M.C.J.*, but it may be mentioned that while there are no radical departures from what may be termed the standard practice in modern live-axle cars, special attention has been devoted in its construction to the questions of simplicity and accessibility, instances of which are found in the readily detachable covers fitted to the gear-box and the differential casing. The four-cylinder engine, which develops 18-h.p. at a speed of 1,000 revs. per minute, is provided with low-tension magneto ignition, with a simple method of advance and retard. An interesting detail is also seen in the combination governor and hand control of the throttle and extra air inlet fitted in the admission pipe, as shown in the accompanying illustration. The upright arm on the left of the picture is in connection with the throttle lever on the steering wheel, and in response to the motion of the latter for closing the throttle this arm is pulled down-

The Regent Throttle Control.

wards, and, conversely, an upward motion opens the throttle. It will be noticed that the arm is slotted for some distance where it joins the lever C from the butterfly valve, the slot B allowing an independent movement of the butterfly, which is given it from the other side by the engine governor. The control by one lever is effected as follows:—Starting with the throttle lever on the steering wheel only a notch or two forward, the engine is getting just enough gas to keep it turning quietly; two or three notches more cause it to govern ready to receive the load; two-thirds of the way round the quadrant the throttle is full open, the end of the slot in the control arm A being then reached; a movement of another notch or two then cuts out the governor, while the last two inches on the rack admits extra air when the engine is running at high speed. This is effected by the link E, seen at the right of the picture, moving a plate G drilled with four holes which gradually coincide with corresponding holes in the inlet pipe. The transmission is through a leather-faced cone clutch to a gear-box giving three speeds forward and a reverse with direct drive on top speed, ball bearings being fitted to all parts except the engine.

A few days ago an opportunity was afforded us of putting one of the latest Regent cars through its paces, when we found

it answer all the claims made for it in the way of smooth and easy running. In the course of a spin out as far as Reigate and back we found that it was possible to do the bulk of the running on the top, direct gear, a drop to second being only necessary on very steep gradients. The springs are of good length and materially add to the comfort of the passengers and render the chassis well adapted to be fitted with landaulet bodies, of which we understand a large number are now being turned out. Taking a turn at the wheel, we were able to prove for ourselves the claim that the car is an exceedingly simple one to control, the work being practically confined to steering and to actuating the throttle lever on the steering wheel; moreover, the combination butterfly valve and extra air inlet referred to above gives excellent results in practice, the quickness with which the engine responds to any alteration in the position of the lever being very noteworthy. Altogether the Regent car, which, needless to say, attains a good turn of speed on the level, will be found an excellent example of modern automobile construction, and should meet the requirements of a large section of the motoring public.

SOME USEFUL NOTES.

WHEN a thick cloud of blue pungent smoke is emitted by the silencer it is a sign that the motor is being over-lubricated. While it must be admitted that this is good for many engines, specially when new, it must not be forgotten that such an emission is highly objectionable to everybody except those in the car. In most engines a cock is provided by which an excess of oil can be drawn off, while many makers are now adopting the expedient of fitting an overflow pipe in the bottom of the crank case to prevent the engine getting more oil than is good for it.

A GOOD method of testing the compression in a multi-cylinder engine is by removing all the sparking plugs except one. By slowly turning the starting handle one will get an idea of the compression in the cylinder where the plug has been allowed to remain. This can then be removed and another cylinder tested, and so on until all are tried. The unsatisfactory cylinders can readily be distinguished by the ease of their compression points.

THE fact that one tyre of a pair of wheels shows more wear than the other is an indication that the alignment of the wheel is not straight and is to some extent being dragged sideways on the road by the other true running wheels. It is somewhat difficult to ascertain the exact alignment of wheels when the tyres are attached to the rims. With the tyres removed the relation of the wheels to each other, as well as to the frame of the car, can be readily determined by attaching long straight edges to the sides of the wheels, touching the rims at two points, and measuring the distance at the extreme ends of the straight edges.

A SUDDEN and complete stopping of the motor almost invariably indicates a break in the ignition system; gradual slowing down and weakening of the motor may be due to either the ignition or failure of the fuel supply, while spasmodic running is most often caused by the former. These and a few other fundamental principles of like nature, if constantly borne in mind, will frequently enable one to quickly ascertain the cause of the trouble.

WHERE motor-cars are used regularly or periodically during the winter months it is advisable to keep them in a heated motor house, as this greatly facilitates starting of the motor when the car is to be taken out, and renders any work on the vehicle more congenial than if it must be done in a cold atmosphere; in fact, the mechanism is much more likely to receive its proper attention if the motor house has a heating installation.

CONTINENTAL NOTES.

The Targa Florio Race.

The entry list for the Targa Florio race, which is to be held in Sicily on April 21st, closed last week end. Altogether fifty-two cars have been entered for the event as follows:—Two each Lucia, De Dietrich, Darracq, Berliet, Diatto Clement, Digne and Radia; three each Benz, Clement-Bayard, De Luca-Daimler, Junior, Rapid and Gobron; four each Fiat, Itala, Isotta-Fraschini and Züst; and one each Opel, Gaggenau, Metallurgique and C.V.R. There will thus be five nations represented in the contest—Italy by twenty-seven vehicles, France by fifteen, Germany by five, Belgium by one, and Switzerland by four.

An Automobile Meeting at Hyeres.

An automobile meeting is to be held at Hyeres, in the South of France, from the 16th to the 20th inst. It is being organised by the Automobile Club of Hyeres, and the programme comprises a motor paper chase for the 16th inst., an automobile flower show for the 17th inst., a series of kilometre speed trials for the 18th inst., a consumption test and hill-climbing trial for the 19th inst., and a gymkhana and elegance competition for the 20th inst.

Motoring in Sweden.

The annual motor competition between Stockholm and Gothenburg, organised by the Swedish Automobile Club, has just been held. The winner was Salmson, who, on a Fiat, covered the distance in 38 h. 33 min.; Skaenbarg, on a Moto-bloc, was second in 39 h. 28 min.; and Buschirer, on a Horch, third in 39 h. 33 min. Owing to the bad state of the roads and the severe weather encountered, the time occupied was much longer than last year.

A Motor Drivers' Benefit Fund.

At the annual meeting of the German Imperial Automobile Club it was decided, at the instance of the Kaiser, to form a benefit fund for the benefit of motor-car drivers. A sum of £250 is already in hand for the fund, which will be maintained by deductions from the members' annual subscriptions, the latter having been increased for this purpose. Any claim upon the fund pre-supposes at least three years' service with a member of the club; and it is proposed that £500 shall be paid, on the death of a driver, to the nearest relative, at least £500 in cases of permanent disablement, and 3s. per day in case of sickness.

The Grand Prix Race.

No further developments have taken place during the past week in connection with the forthcoming race for the A.C.F. Grand Prix. The three cars which the Germain Company are building for the contest will be driven by Messrs. Degrais, Roch-Brault, and Perpère. They will be of relatively small horse-power—from 70 to 80-h.p.—but the weight of the cars is being kept down very low; in fact, it is stated that they will turn the scale at about 550 kilog., as against the old 1,000 kilog. limit.

An Italian Reliability Trial.

The Turin Automobile Club is organising a reliability trial of medium-power touring cars, to be held from June 24th to 28th next, the weight of the vehicles having to be in proportion to the piston area. There will be four daily runs of about 300 kilometres, the competition concluding with a hill-climbing test on Mont Cenis.

A Voiturette Race in Sicily.

The Targa Florio race, to which reference was made in our last issue, forms one of a series of events to be held during what is known as the Sicilian week, other items in the programme comprising motor-boat contests and a race for voiturettes. The latter is to be held on April 18th, and the competing machines will be divided into two classes as follows:—1, single-cylinder machines of a bore from 85 to 120 mm., and 2, two-cylinder cars from 70 to 90 mm. bore, the weight of the vehicle being in proportion to the cylinder bore on the basis of 433 kilogs. for

85 mm. and 742 kilogs. for 70 mm. The contest will be held on the Targa Florio course over a distance of 250 to 300 kilometres. The winner will secure a cup and a cash prize of £80; the second a silver medal and £40, and the third a bronze medal and £24. So far two Florentias and six De Dions have been entered.

Touring in Algeria.

The Automobile Club of Algeria is organising a motor excursion into the interior of the country for Easter. The party will leave Algiers on April 2nd, the first day's run being to Bougie, 230 kilometres; on the 3rd, the destination will be Setif, 114 kilometres; on the 4th, El Kantara, 150 kilometres; on the 5th, Biskra, 52 kilometres; on the 6th, stay in Biskra; on the 7th, Biskra to El Kantara, 52 kilometres; on the 8th, El Kantara to Batna, 138 kilometres; on the 9th, Batna to Constantine (where the excursion will officially end), 117 kilometres.

Public Services in Germany.

Arrangements are in hand for the establishment of a motor-car service between Schwerin and Ostorf. Four twenty-seated motor-buses are being acquired for a projected service between Lengenfeld, Falkenstein and Planen.

M. Van Marcke on the Hotchkiss Six-Cylinder Car on which he is making a tour of France. The illustration is reproduced from a photograph taken at Nice.

Miscellaneous Items.

It is proposed to hold a trial of heavy motor vehicles in Madrid in May next, on the occasion of the motor-car exhibition in the Spanish capital.—A motor-car exhibition was opened at Nyköping, Denmark, on the 2nd inst.—A competition of silencers for motor-cycles is to be held in Vienna on the 10th inst.—The Berlin municipal authorities have lately put a motor street watering wagon in service, the chassis, which has a 16-18-h.p. four-cylinder petrol motor, having been supplied by the N.A.G. Co.—A motor-boat volunteer corps is being formed in Berlin.—A motor racing track has just been opened in the Parc Royal de la Favorita, at Palermo, Sicily.—Messrs. Panhard and Levassor have just completed three 18-h.p. motor ambulances for the French military authorities.—Tyre-changing competitions are just now very popular on the Continent. One has just been held at Turin, while the Automobile Club du Rhone, of Lyons, is organising a similar event for the 18th, 19th, and 20th inst.—M. Van Marcke is continuing his tour of France on a six-cylinder Hotchkiss. During the past week he has visited Alais, Montpellier, Beziers, Perpignan, Carcassonne, Toulouse, and Tarbes.

THE SCOTTISH RELIABILITY TRIAL.

THE rules and regulations of the third annual Scottish Reliability Trial are now ready and may be obtained from the secretary, Mr. R. J. Smith, 59, St. Vincent Street, Glasgow. As we have already announced, the coming event will be largely on the lines of the Trials of 1905 and 1906, but the route will provide an even more severe test of the competing vehicles.

In each class only one car of any specific make, type, and horse-power will be accepted; and no cars will be considered as of different h.p. unless the cylinder capacities vary by at least fifteen per cent. In determining such variation fifteen per cent. shall be deducted from the larger of the cylinder capacities. Preference will be given to entries by (1) a maker, or (2) the nominee of a maker.

The classification of vehicles will be as follows:—

1. Vehicles, the selling price of the chassis of which, with tyres, does not exceed £200.
2. Vehicles, the selling price of the chassis of which, with tyres, exceeds £200 but does not exceed £300.

wise provided for, on the following basis:—(a) For each stop not exceeding five minutes—one mark for every minute or part of a minute. (b) For each stop exceeding five minutes and not exceeding fifteen minutes—ten marks for the first five minutes, and three marks for each succeeding minute or part of a minute. (c) For each stop exceeding fifteen minutes—forty-five marks for the first fifteen minutes, and four marks for each succeeding minute or part of a minute. Where two or more stops from a like or similar cause take place within short intervals the committee reserve power to determine that such shall be reckoned as one stop under above rule.

There will be compulsory stops of one hour on each day for luncheon, and compulsory stops may also be announced on the afternoons of the first and second days for tea. No ladies are to be carried as passengers.

Every vehicle in Classes 3, 4, 5, and 6 must be fitted with a standard side-entrance body, and have a minimum dimension from the front of dashboard to the front of the rear wheel tyres of 4 ft. 6 in. The fuel tank must be of sufficient capacity for the maximum single day's journey (say 170 miles), and will have to be fitted on the bottom with a draw-off tap, with an outlet not less than $\frac{5}{8}$ in. in diameter, to facilitate speedy emptying before

Motoring in Egypt.—Mr. Percy Warren and party in his Daimler Car at the foot of the Pyramids.

3. Vehicles, the selling price of the chassis of which, with tyres, exceeds £300 but does not exceed £400.
4. Vehicles, the selling price of the chassis of which, with tyres, exceeds £400 but does not exceed £600.
5. Vehicles, the selling price of the chassis of which, with tyres, exceeds £600 but does not exceed £800.
6. Vehicles, the selling price of the chassis of which, with tyres, exceeds £800.

No car showing more than 15-h.p. on the basis of the following formula must have a seating capacity of less than four:—

$$\frac{\text{Cylinder diameter in inches}^2 \times \text{number of cylinders.}}{2.5}$$

The Trial will take place from June 25th to 29th inclusive and entries will be received up to May 14th, although the committee reserve to themselves the right to accept them at double fees for twenty-one days after that date.

There will be a maximum number of marks for the run, and points will be deducted for every minute or part of a minute during which the vehicle is at rest from the time of starting to the conclusion of the run (except for tyre troubles), or as other-

and after the trial for the purpose of determining the fuel consumption. A ring or eye must be fitted to the cap of the supply vent of the fuel tank, and another to the tank to facilitate the sealing of the same by the committee. One fuel tank only may be fitted, and it must be in a standard position, but need not necessarily be of the size standard to, and to be sold with, the vehicle. There shall be no auxiliary tank of any size or description.

There will be hill climbing tests and also brake and stopping and starting tests. The proposed route is as follows:—

June 25.—(152½ miles), Glasgow, Arrochar, Inverary (luncheon), Killin, Aberfeldy to Perth.

June 26.—(158½ miles), Perth, Braemar (luncheon), Banchory, Stonehaven, Fettercairn, Banchory, Aberdeen.

June 27.—(160½ miles), Aberdeen, Huntly, Dufftown, Tomintoul, Grantown-on-Spey (luncheon), Elgin, Forres, Nairn, Inverness.

June 28.—(154½ miles), Inverness, Spean Bridge, Kingussie (luncheon), Tummel Bridge, Pitlochry.

June 29.—(122½ miles), Pitlochry, Aberfeldy, Lochearnhead, Callander (luncheon), Glasgow.

ATTENTION in the Midlands is being drawn to the fact that there are no facilities for automobile instruction in the University of Birmingham.

A MOTOR track from the Fort at the mouth of the harbour at Shoreham to a point west of the North Bridge is in contemplation by the purchaser of the famous Bungalow town, Mr. W. F. Crier.

THE annual dinner of the Ripley road-menders took place on Saturday at the White Lion Hotel, Cobham, with the District Surveyor of Walton-on-Thames in the chair.

A NEW list of registering authorities in the United Kingdom in connection with the Motor Car Act of 1903 has just been issued by authority of the Local Government Board.

RIVAL bill-stickers engaged during the County Council elections in London last week are reported to have employed motor-cars in their midnight attacks on the hoardings of opponents.

OVER 250 signs denoting the names of villages, distances from London, and other useful information, have already been fixed in accordance with the Automobile Association's programme.

THE Taunton Motor and Cycle Company, of which Mr. B. E. Denning is the proprietor, have made extensive alterations to their garage, where they now have accommodation for forty vehicles.

REPLYING to a question in the House of Commons, Mr. R. B. Haldane, the Secretary for War, says that the question of the supply of horses to the army is being thoroughly considered, the disuse of horses for omnibus work having made the subject one of pressing importance to the military authorities.

IT may not be generally known that Humber, Ltd., closed down their Wolverhampton works some years ago and transferred that part of the business to their other works. As they have now built still larger works at Coventry, it is not likely that they will ever require Wolverhampton works again, and they are now anxious to dispose of them.

MR. T. SPONG has taken 205, Shaftesbury Avenue, W.C., near the London depot of the Daimler Company, and for the purpose of his expanding business in non-skids and motor tyres he has also taken the premises at 384, Euston Road, N.W., where he will carry large stocks. The warehouse and store-rooms at 76, Neal Street, W., will be continued.

WE learn from Paris that one of King Edward's motor-cars was destroyed by fire at the Quai d'Orsay Station on Monday night. The car had been placed on a special railway truck for conveyance to Biarritz, and it is stated that in running off the petrol the woodwork of the wagon became saturated, and, owing to some cause which has not yet been ascertained, caught fire, the car being practically destroyed.

SEVERAL new departures in connection with carburettors with the view of effecting economy in petrol consumption are announced. One is known as W. S. Surgeant's power vapour container, with which some experiments have just been made at the works of Messrs. Aster, Ltd., at Wembley. The other is the Gillet-Lehmann carburettor attachment, which is being introduced by Carburation, Ltd., Byron House, Fleet Street, E.C.

AT 19, Store Street, Tottenham Court Road, London, W.C., Messrs. G. T. Riches and Co. have a comprehensive stock of motor accessories and spare parts for all types of automobiles. In addition they undertake re-magnetising, the charging of accumulators, &c. Some idea of the variety and extent of goods they are able to supply by return of post may be gleaned from the fact that the index to the firm's new catalogue has nearly a thousand references. Thanks to the careful way in which this has been compiled, the motorist in quest of spare parts, accessories, &c., will have no difficulty in ascertaining that it can be supplied by Messrs. G. T. Riches and Co. The book extends to 130 pages, and there is a plentitude of illustration which considerably adds to its value as a work of reference useful in the garage as well as on the shelves of the private owner. With such a list, where completeness is evident, it is scarcely possible to particularise any section; all are equally good.

CAPTAIN DEASY starts from Dublin on Monday on a thousand mile trip under the observation of the Irish Automobile Club.

OWING to the perversity of the weather the non-skid devices fitted to motor-omnibuses in actual service between Putney and Shoreditch have only been tested for their durability, apart from their value in avoiding side-slips.

A CLASS of soldiers and sailors who have been instructed in motor-car driving and mechanism will be examined at Plymouth on Tuesday next for the A.C.G.B.I.'s driving certificate.

MR. LIONEL JAMES, the war correspondent to "The Times," and Sir George Warrender, Commodore of the Eastern Fleet, are amongst the recent purchasers of Rover cars.

THE Autocar Company having taken over the business lately carried on by the Montgomery Motor Company, Ltd., in the Lincoln Road, Peterborough, are now arranging garage accommodation for about thirty vehicles. Mr. M. J. Rowe is the general manager of the new venture.

CONSIDERABLE interest was evinced in the wind shield brought out a year or so ago by M. Huillier, of the Mors Company. The great objection to any glass front is that it obstructs the view ahead in rainy weather. It also interferes with the view of the driver at night when the head lamps are not lighted, which is a matter of considerable moment, as in some large cities—Paris,

Huillier's Improved Wind Shield.

for instance—it is forbidden to use powerful lights. M. Huillier has now introduced the improved shield illustrated herewith; it is now made in such a manner that the top half (of glass) can be readily swung down into the position of the lower half when desired, and the leather forming the lower half be rolled up. When the wind shield is thus lowered it has still a certain protective effect, but leaves the view ahead free and unobstructed.

AN international character will be given the display of the Aero Club at Cordingley's Motor Car Exhibition at the Agricultural Hall by exhibitors from the United States, as well as from France, Belgium, and other European countries.

REED'S Perth Carriage and Motor Works, of Perth, N.B., who are now devoting considerable attention to motor body work, have sent us a photograph of a neat landaulet body they have recently completed and fitted to a 10-12-h.p. Humber chassis for a Stirlingshire motorist.

AN American firm has lately introduced a small automobile intended for the use of children. The miniature car, which weighs about 60lb., is equipped with artillery wheels and ball bearings, pneumatic tyres, oil lamps, horn, number plate, and an imitation coil box. Instead of a petrol motor it depends upon a large steel coil spring for its source of energy. The speed of the car is never greater than five miles an hour while the power is being used, and it is extremely simple to operate, there being only two pedals that need attention. The spring motor, which is wound up by a handle and one winding, will run the car a distance of an eighth of a mile.

THE Chairman of Messrs. Maple and Company regards the motor-car as a cause of "economy in luxuries."

AT the ordinary general meeting of Messrs. Measures Bros., Ltd., Mr. R. H. Measures, who presided, said they were arranging to make motor castings.

AT a meeting of the Institute of Marine Engineers, on Monday last, Mr. T. D. Kelly read a paper on "High Speed Two-stroke Engines, with some remarks on Internal Water Cooling."

IN connection with the discussion on Accessibility at the recent meeting of the Institution of Automobile Engineers, the new method of fixing the carriage body on the chassis lately introduced by Messrs. Pack and Sons, of the Carriage Works, George Street, Brighton East, is of interest. The illustrations given herewith show the arrangement so clearly that but little description is necessary. It will be seen, however, that the

Fig. 1.

Fig. 2.

body is hinged to the chassis at the rear, and can be raised up to enable any necessary work—greasing, adjustment, or repairs—to be carried out in connection with the clutch, gear-box, brakes, or other parts of the mechanism, with a minimum of trouble. The makers claim that, with their levers fitted, a car body can be raised by one man, and that it is rigidly held up when the lever joint is fully extended.

THE magistrates of Glasgow having had under consideration a communication from the secretary of the Highways Protection League, suggesting that a memorandum of amendment be addressed to the Secretary for Scotland, report that, in their opinion, no alteration of the existing law is required, and that it is unnecessary and inadvisable to petition the Secretary for Scotland as desired by the said league. This recommendation was unanimously adopted by the Corporation.

MOTORISTS passing through Arbroath will find assistance in the way of accessories, &c., from Mr. C. Moore, 62, Keplie Street, Mr. D. Robbie, at 24, Brothock Bridge, and Messrs. J. S. Smith and Sons in the High Street.

FROM Messrs. W. G. Walker and Co., Emery Hill Street, Westminster, comes a descriptive circular of their special dynamometer for quickly and accurately testing the brake horsepower of petrol motors from $\frac{1}{2}$ to 60-h.p.

MESSRS. A. W. GAMAGE, LTD., have had a sale at their place in Holborn, London, and naturally take occasion to point to their progress as phenomenal. In 1878 the frontage of the shop was 16 ft. and the capital £40. To-day the capital is £200,000, the frontage to Holborn alone is 160 ft. and to Leather Lane 300 ft., while the floor space equals five acres. In normal times the number of employees is 600; often it rises to 1,000. The motor department is responsible for a large number, and its assortment of goods is singularly varied and up to date.

MESSRS. RUSH AND ALOOF, LTD., are the proprietors of the Motor Drivers' Employment Agency, 199, Piccadilly, London, W., which has been formed to supply reliable drivers to employers. In view of the Workmen's Compensation Act, they are advising chauffeurs to be satisfied as to their medical fitness for the work. The grant of certificates on this point after an examination by a medical man is a special feature of the agency's operations. No fees are charged for registering applications, and the employer is charged when a situation is found. Those in search of situations will probably find the agency of service.

THE attention of motorists is being drawn to the use of the ordinary household Hudson's dry soap for the rapid and easy cleaning of greasy spare parts as well as grimy hands. With the view of facilitating its use, the firm have brought out a small canister with a special lid, to act as a sprinkler for the powdered soap.

RURAL district councils should now be called upon to exercise their powers to compel occupiers of land adjoining the highways to cut the hedges, particularly in the vicinity of cross roads. In view of the motoring season, it is difficult to exaggerate the importance of having the roadside hedges cut.

MESSRS. WELDEN AND BLERIOT, LTD., 53-54, Long Acre, W.C., are the agents for an automatic lighter of great interest to motorists. A few drops of methol alcohol on a wick in one compartment are ignited by the withdrawal of the igniting device therefrom—thus obviating the need for matches. The lighter is of a convenient size for the vest pocket.

MESSRS. A. MILNE AND SONS have ample facilities for meeting the requirements of motorists in the High Street and Castle Montrose. They have also branches at Brechin and Edzell for the supply of spare parts. At Brechin also Messrs. A. Simpson and Son have repair shops, and Mr. Theim, the proprietor of the Panmure Arms Hotel at Edzell, has a well-arranged garage.

IN an article in the "Manchester Guardian" on the Automobile Industry, reference is made to the "main object of all the firms who started manufacturing cars in the early nineties as being to imitate the leading French and German designs as closely as possible. Even so recently as 1903 Sir Alfred Harmsworth bought a Mercedes of the newest type turned out of the Cannstatt works, and exhibited the chassis at Cordingley's Exhibition for the benefit of English makers."

FROM the offices of the "Electric Accumulator" (15, Queen Street, Cheapside, E.C.) comes a copy of a work they have just published entitled "The Treatment of Storage Batteries." It is from the pen of Mr. R. W. Vicarey, who explains in the preface that his object has been to assist in promoting a better knowledge of the secondary battery, and also to improve the commercial value of the accumulator. While the shape of the book is not one we like, yet its contents will be found to comprise a large amount of useful information to those motorists whose cars are fitted with coil and accumulator ignition. The work concludes with an alphabetically arranged glossary of technical terms connected with accumulators and also a few useful tables.

RAILWAY COMPANIES AND THEIR MOTOR SERVICES.

RAILWAY companies are feeling the rivalry of the automobile in connection with their suburban traffic, but they are using the self-propelled vehicle to feed their trains in the country. There is really no occasion for alarm where the directors and management of the great trunk lines approach the new locomotion in a common-sense way, recognising that there will be inevitable losses in some directions, which may, however, find compensation in others. The Great Western Railway Company was one of the first to discover the revenue value of the motor-car as well as its competitive power. At the last half-yearly meeting of the concern, Mr. Alfred Baldwin, the chairman, remarked that an analysis of the returns showed that they were losing a good deal of short distance and first class traffic owing to the motor-car services which other people had established. But, as a set-off to this, the adoption of motor-cars in other districts by the railway companies had prevented further diversion from their line, and enabled them to make up for losses elsewhere. This is the proper view to take. And tramway authorities, too, instead of denouncing and harassing the motor-bus, should recognise that vehicle as a possible feeder, bringing passengers from localities as yet un-

The Great Western Railway Company has road motor services between Slough, Eton, and Windsor; Windsor, Winkfield, and Ascot; Slough, Farnham, and Beaconsfield; Marlborough and Calne—a journey of an hour and a half for 1s. 6d.; Weymouth and Wyke Regis, Paignton and Totnes, Torquay and Paignton, Penzance and Pendeen, Stourbridge and Catshill, Wrexham and Aldford, and Aberystwyth and Aberayron. Motor-omnibuses are also being run between Bridgwater and Nether Stowey, Moretonhampstead and Chagford, Plymouth and Roborough, Plymouth, Saltash and Albaston, Helston and the Lizard, Penzance and Land's End, Penzance and St. Just, Stroud and Rainswick, Abergavenny and Brecon, and Lampeter and Aberayron. All these in conjunction with the ordinary train service from London and other important towns. Parcels are conveyed in many cases, and books of tickets are issued in connection with some of the suburban services. In addition arrangements can be made with the station-masters at Slough, Windsor, or Mr. W. A. Hart, the divisional superintendent at Paddington, for special cars for the conveyance of small private parties.

Motor-omnibus services organised by the London and North Western Railway Co. are now running between Watford, Bushey Heath and Harrow and Wealdstone; also between Croxley Green and Watford. These serve a wide area, and a time table has been drawn up showing the trains from Euston that

Some-time ago the "Glasgow News" placed an order with Argyll Motors, Limited, for the construction of seven cars, specially designed for the conveyance of newspapers, and the full motor delivery in connection with their Express Service to the various districts of the City is now in operation, as will be seen from the above illustration. By means of the vehicles not only are newsgents in Glasgow enabled to get their parcels more quickly, but the cars are also being utilised for the conveyance of Country Newsgents' parcels, a rapid and effective service being maintained.

served by regular systems of conveyance, thus postponing for a season the advent of the long-distance motor routes that may eventually restrict the area of tramcar utility.

During the last season or two many of the companies have considerably developed their motor-car services, and their preparations for the summer months of 1907 indicate a great extension that will surprise many of the organisers of slower going services.

Some of the companies, like the North Eastern, are still making arrangements for the extension of their services during the coming season. Meanwhile, the following particulars of the services now in actual operation will show how general is the utilisation of the motor-car by the leading lines.

A great many motor-omnibus services are being run by the Great Eastern Railway Company in the eastern counties at the present time. The vehicles run from Chelmsford in three directions, viz., to Danbury, Great Waltham, and Oxney Green, opening up new residential districts. A motor-bus goes from Colchester to West Mersea, taking an hour on the journey, the fare being 10d. Shotley is connected with Ipswich by an all-year-round service, and motor-buses run from Lowestoft to Kessingland Beach and Southwold. In the same district buses run from Norwich station to Loddon and Beccles to Loddon, 65 or 45 minutes' journey, respectively.

they meet. In North Wales, too, the company have motor-omnibus services in operation between Holywell station and town, Holywell and Mold, and Connah's Quay and Mold. The Rhymney Railway Company has decided to run motor-cars on their line.

The Great Northern Railway Co. is running a motor-car service between Finchley and Edgware—Saturdays and Sundays excepted. Nineteen trips each way are made on the other days of the week.

In addition to the English lines the Scottish railways have recognised the value of the motor-car in connection with their passenger services, and splendid facilities are being provided for visitors to the Aberdeen district seeing much of the beauties of that part of the country by road. During the coming season a comprehensive scheme will be inaugurated, of the success of which there can be little doubt. Run in conjunction with the railway system, and having the merits of punctuality and convenience, all the services of motor-cars established by the railway companies to run on ordinary roads should have every condition of success.

A MANCHESTER firm—Messrs. Cookson Bros., of 511, Chester Road, Old Trafford—have struck out a new line, that of hiring out charged accumulators at a charge of one shilling per week.

[Letters to the Editor should be addressed to the offices,
27-33, Charing Cross Road, W.C.]

MOTOR LUBRICATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—My recent communication to you on motor lubrication has, I am pleased to note, produced some interesting information on the subject. The point I raised in my last letter as one which in my opinion has been overlooked was the all-important one of friction reduction. I desired to draw attention to the fact that much has been written on chemical tests, smoke, carbonisation, viscosity, &c., but little on the most important point, viz., how to obtain the greatest development of power with the smallest consumption of energy in overcoming the friction between the surfaces in contact, whether sliding or rolling.

It is assumed by many that so long as the surfaces are kept apart by a film of oil, perfect lubrication is attained. This idea is erroneous. Two moving parts can be prevented from touching without being ever fairly lubricated. An oil that will do excellently for one purpose will fail altogether under different conditions. Take, for example, the delicate mechanism of a watch; a motor oil would certainly prevent contact between the frictional parts, but would not lubricate them. So with a petrol engine; what would prove satisfactory for, say steam cylinders—a heavy, highly viscous oil, which retains its body

Touring in Italy.—St. Martin's Church, San Martino.

under great heat, would be useless for the cylinders of an internal combustion engine. And yet it has been stated that all oils, thin and heavy, are brought practically to the same level under the influence of the heat of the cylinder walls and pistons. There is no oil so heavy and which retains its viscosity so effectively at high temperature as a steam cylinder oil. Then why is it not used for internal combustion motors? Motor oils cannot be used for steam cylinder lubrication—why? Because they thin down too rapidly and cannot advantageously be applied continuously, as in a petrol engine. But a steam cylinder oil could be used for a petrol engine. Then why is it not? Simply because it is too heavy! Such oil would stop an engine in a very short space of time. In the first place, it would carbonise so freely that the rings would in all probability seize, or, if this did not actually happen, the thickness of the oil, which would continue to thicken under the influence of extreme heat, would so augment the friction that before long the power required to overcome the combined friction of the moving parts and of the oil itself would be greater than that produced, and the engine would cease working. I mention this as an exaggerated case, for, no sane people would dream of using such an oil for a petrol engine, as I wish to make it quite clear that all oils at high temperatures do not stand on the same footing, and that thick oils are not necessarily good lubricants simply because they are thick and keep the metal surfaces out of contact.

Then as to the thick oils—not of the steam cylinder class—so much used for petrol engines, there is no reason why they should be employed, unless it be to cushion a defective or loose bearing, or to hide the deficiencies of a wrongly-designed system of lubrication. It is admitted that they carbonise more freely than the thin oils. This, however, is only one of their drawbacks. Their great failing is that they take up too much power in overcoming the friction between their own molecules. When two surfaces are lubricated part of the oil adheres to each, and it is these two oil films that rub against one another and so take the friction off the metal. Now, if the oil is thick, it follows that the two oppo-

sing films are more securely locked together and take more power to drag asunder than with a thin oil, where the molecular resistance is greatly reduced and the liquid friction therefore correspondingly low.

It is this avoidable waste of power which everyone interested in motor-cars, whether manufacturer, agent, or user, should know about. The present thick oils are simply a survival of the old air-cooled engine practice, where thick oils were always used. There is no doubt whatever that at least 20 per cent. of power is lost through imperfect lubrication. Look what this means in additional expenditure; besides which, there is the dissatisfaction of not getting out of an engine what one ought to do. From the investigations I have made, I feel that in putting the average preventable waste of power at 20 per cent. I am not oversteating.

With the present day methods of applying the oil in a continuous stream or spray, there is no need for heavy oil, which, were the feed not regular, might be necessary in order not to let the surfaces run dry before receiving a fresh application of oil. For engines with small frictional surfaces, high speeds, light weights and comparatively easy conditions of work, a thin oil is the most efficient, and it is a pity to clog them with thick, heavy oil which only absorbs power. Some of the oils now used by motorists seem more suitable for the bearings of the "Dreadnought's" main engines.

I am indebted to Messrs. Wakefield and Co., who have all along advocated thin as opposed to the heavy oils, for assistance in making tests and in placing at my disposal valuable data, &c., on this important matter.—Yours truly,

J. S. CRITCHLEY.

THE A.A. AND ITS CORRESPONDENTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With your permission I should like, through the medium of your paper, to correct an entirely erroneous opinion which I am given to understand is held by certain of the committee of the Yorkshire and provincial clubs with reference to the payment of correspondents of the Automobile Association. Speaking personally, although I hold myself responsible to a great extent (with the right royal assistance of Mr. Stenson Cooke) for extending the work of the A.A. in Yorkshire, I have never received, nor do I anticipate receiving, any remuneration whatsoever. Had the Automobile Association been operating in Yorkshire last year as it is doing during 1907, and had I been a member, I know it would have saved me something like £50. No more benefits accrue to me than to any other ordinary member. Were the aims and objects of the A.A. more widely known (and I am doing my best to make them so) I very much doubt if there is a single motorist who would not wish his name to appear among its members.—Yours truly,

SYDNEY S. DIXON.

CORRUPT PRACTICES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I note you make comments on the fact that the Automobile Club is calling the attention of its members to the "Corrupt Practices Act," in relation to chauffeurs' commissions. They are starting at the right end. The employer is the person really to blame in the matter. Frequently the whole management of a car, the ordering of parts, arranging for repairs, and every other matter, is left in the chauffeur's hands, with the inevitable result that those who pay no commission are always "out of stock," "incapable," or "expensive," and the owner thinks what a considerate chauffeur he has got. Under the present condition it seems that those who do not give presents go bankrupt and those who do will presently go to prison. Employers have a far better chance than all the Acts of Parliament ever passed to put down this undesirable practice; undesirable, not only from the view of employer and trader, but also from the view of the honest chauffeur. There is no doubt that it is this practice that induces so many "wasters" to take up motor driving, and keeps many a good man out of a job.

Masters, wake up! Look after your own affairs, in spite of the Corrupt Practices Act being in operation. I don't think your time will be wasted. Go and see the people you are dealing with. They will be very pleased to see you.—Yours truly,

PETROL.

EXHAUST VALVE TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—One of the exhaust valve guides of my 7-h.p. Panhard was badly worn, so I had it bored out and a thicker valve fitted, which stopped the noise it used to make, but the valve, instead of dropping into its seating, now strikes one side and then slides down. The explosion must evidently take place before it gets there, as there is no power in that cylinder. I ground the valve in well and took the car for the first run yesterday; the engine pulled well for a mile, then I had to get home on one cylinder. On taking the valve out I found about half an inch of the face very bright and the rest black. The tappet—I think you call the stem that the valve rests on—is pulled away from the engine by the spring below. If it could be made to push instead of pull, it would bring it in line with the valve stem and

push it up straight, instead of all one side. I think this must be the reason the guide wore before, although it has never lost power like this, and I have constantly used the car for two years. I thought of screwing a penny flat on top of the tappet and cutting the valve down. Would this, do you think, send it up straight, or do you think it has not been put together properly after the engine was taken down. If you could suggest something to help me out of my trouble I shall be obliged.—Yours truly,

TOM WOOTTWELL.

[We should be inclined to think that our correspondent's trouble was caused by the valve stem being slightly too long, as this is often the trouble with an old-type Panhard where the tappets are taken away from the valve stems for the purpose of governing. Undoubtedly there must have been something overlooked in the re-erection of the engine. The screwing of a penny on the top of the tappet would be useless; in the first place, the metal would not be hard enough to stand any length of time, the ends of the valve and tappet being usually hardened. In the second place, the fixing of a piece of metal on the top would not permit the tappet leaving the valve stem, therefore the engine would constantly fire when the governor was cutting out. When the tappet is on its lowest point the top should be low enough to clear the end of the valve stem.]

FOUR OR SIX CYLINDERS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a keen motorist, but not at the present time an absolute convert to six cylinders, I have been following the discussion which has

troversey the side which is most accurate in its statements generally succeeds. There is an old saying that lookers on! see most of the game.—Yours truly,

ENGINEER.

ARE CARS TOO COMPLICATED?

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—We notice in the last issue of your *Journal* the question is asked, "Are cars too complicated?" We are astonished that, when everything is being done to simplify things, this question should arise. It seems to us that simplicity itself has been attained in the recognised up-to-date motor-car. For instance, as far as we are concerned, only two pedals are used in the 1907 Peugeot, except in the very large size, where a third is, although not necessary, desirable. The two pedals which are used in the ordinary models are the brake and clutch, and these have been so long in existence that there is certainly no extra increase of complication here. Lubrication is now reduced to automatic action of a pump. There are no drips to adjust, no springs to break, and the desired lubrication is simply obtained by a plain gear wheel pump, which is absolutely simple in its action. Ball bearings are used on the road wheels and in the gear-box, the lubrication of the latter being effected by splash off the gear wheels. For the whole car there is only one lubricator on the dash, which can be turned either on or off. When sufficient oil has run into the crank chamber lubrication ceases. Can anything be more simple than this?

Where the trouble always has been, and probably the only trouble for the last two years, is the carburettor. The Peugeot device is now

The Meet of the Automobile Club of Australia in Sydney for the Opening Run of the Season.

been taking place in your paper with very great interest, but when I see Mr. Weigel so grossly misrepresenting facts and figures and misrepresenting the arguments put forward in favour of six cylinders, I feel that there must be a great deal of merit in the six-cylinder, or else there would not be so much bitterness shown to them by those interested in the four. In Mr. Weigel's letter he very cleverly, but I think most unfairly, suggests that the four-cylinder engine was really a bigger and more powerful engine than the six-cylinder, and that Mr. Edge did not show the respective sizes of both engines. Now I cannot believe that Mr. Weigel did not carefully read every word of Mr. Edge's paper. If he did not do so, then I think he had no right to enter into the controversy.

In dealing with the four and six cylinder engines Mr. Edge carefully pointed out that the four-cylinder engine had 453 cubic inches and that the six-cylinder engine had 301, and that the four-cylinder engine had to be half as big again as the six-cylinder to develop the same horsepower at the same piston speed. This all seemed to me to be stated extremely fairly, and if Mr. Weigel really wants private people unconnected with the trade to continue to believe in four-cylinders he really must not mis-state his opponent.

Mr. Edge's paper seems to me exceedingly moderate, and my mind is almost now made up that my next car will be a six-cylinder. I am quite satisfied that actually a six-cylinder is the best, and it has only been the fact that the best six-cylinders have been rather expensive that even makes me hesitate at the moment, and now that the prices of the four and six of equal quality are becoming practically the same I am afraid I shall soon be numbered amongst the six-cylinder enthusiasts; but, as one probably a good deal older than Mr. Weigel, I hope he will take a little friendly advice from me—that in public con-

acted by throttle lever, and has automatic air intake, such things as springs and rubber disc being discarded in favour of a plain ball lifted by the suction of the engine, which never requires attention or adjustment, and, above all, gives a constant mixture at all speeds. An improvement in the steering has been effected by putting an adjusting ring, which allows of the wear being taken up. The ordinary leather clutch is still used, causing no trouble whatever; it is far more simple than the multiple disc arrangement, and just as flexible. The adjustment of brakes is another feature which has been simplified by the turning of a thumb-screw to make the necessary adjustment. We think it will be admitted that the absence from the dash of endless lubricating pipes, coils, air levers and voltmeters, must all make toward simplification, and we certainly cannot understand the contention of M. Baudry de Saunier.—Yours truly,

F. GUY LEWIN.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I see you raise the question in the last issue of the *M.C.J.* "Are cars becoming too complicated?" To my mind there is only one answer to the question, and that is an emphatic "Yes!" In the recent discussion on the subject of "four or six cylinders," at the Automobile Club, Mr. S. F. Edge was asked the number of parts in a six-cylinder engine, and how they compared with those in a four. He was unable to give the exact number of parts, but admitted there were sixty-four more in a six than in a four-cylinder. This is, I venture to think, ample evidence of unnecessary complication, and, in my opinion, one of the greatest objections to the increase in the number of cylinders, even admitting that a six may have a slight advantage over a four, which

the advocates of the latter deny. The present "artistic" automobile productions are all very well so long as the demand for high-priced, high-powered cars lasts, but the time is rapidly approaching when manufacturers will have to devote attention to the man of moderate means much more seriously than they have done in the past, and possibly then greater simplicity will at last begin to receive the attention it deserves.—Yours truly,

R. WARBURTON.

A CHANGE-SPEED GEAR TROUBLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to "Peugeot Pinion's" letter in the last issue of the *M.C.J.*, your correspondent evidently refers to one of the old type 12-16-h.p. chain-driven Peugeots, which have very large gear-boxes, and the shells of which sometimes crack, being somewhat thin and without any strengthening ribs. He tells us that his low gear grinds, especially when climbing a hill, and that he has had to have the pinion renewed more than once. The trouble must be attributed to one of the following causes, which I place in the order of their probability:—(1) The counter-shaft is bent, being very long between its bearings, and if the clutch has at any time been fierce, the strains received will be quite sufficient to account for the shaft getting distorted. The remedy is, of course, to have the shaft carefully straightened, or to have a new one made of a very high grade steel; the latter, however, would be expensive, owing to the flanges for the second and third speed rings being solid with the shaft, as also the engagement for the fourth speed with dog clutch; (2) the shaft may be out of alignment, and perhaps it will be found on careful examination that the shell of the box is cracked near the bearing; (3) the low speed pinion, which is keyed on to the shaft, may be out of truth sideways, if the hole in the former is not a driving fit on the shaft, as the keying up may have set the wheel over slightly.

To properly diagnose the trouble, a very careful examination by a thoroughly competent mechanic must be made, and the fault will undoubtedly be found to lie as indicated above. I may say that the low speed pinion in this gear-box is usually left soft, but in having a new one made I strongly recommend the "Penax" brand produced by Messrs. Buckley, of Sheffield, which, although it does require to be case-hardened, is toughened by a special process that is eminently suitable for gears.—Yours truly,

C. A. E. S.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to "Peugeot Pinion's" query in your last issue, this trouble is a very common one with the old-type Peugeot cars; it is due to the exceptionally long shaft springing and allowing the gears to come out of mesh. The only remedy is to have an extra strong shaft fitted, which of course necessitates altering the bore of the gear wheels or fitting an intermediate bearing.—Yours truly,

T. J. H.

IS THE LEATHER-FACED CONE CLUTCH DOOMED?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent, F. C. Burton, asked in your issue of March 2nd if the leather-faced cone clutch is doomed. In my opinion a discussion as to the value of the leather clutch over the metal or the metal over the leather is a somewhat futile proceeding, for, before the advocates of the two types can finish what they have to say, both the leather and metal clutch will be a thing of the past. Why should the motorist be harassed by so prolific a cause of discomfort, when it may be avoided by the substitution of the epicyclic gear? The cars at present using this more advanced form of gear are undoubtedly forging away ahead of those which still cling to the old nerve-racking type, and it has become a positive infliction for the owners of rotary gear cars to drive occasionally in cars of the clash gear type.

No one who has used a car with an improved rotary gear will ever be induced to go back to the old form, and that is why the manufacturers who have adopted the epicyclic gear, such as the Lanchester, or better still the Adams, on account of the simplification of the control, find themselves in the advance guard of the motor industry.—Yours truly,

C. H. MOWER.

LUBRICATION TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can you or any readers of the *M.C.J.* explain the cause of lubricating oil blowing back and getting hot? The engine is a two-cylinder 12-h.p. Mutel, the lubricator a gravity drip feed on the dashboard, the tubes the entering cylinders on the exhaust side. I have tried a ball release valve in the crank chamber, but with no result. The engine runs quite satisfactorily, but the only lubrication it gets is in the crank chamber, the lubricator for this being a pump one. Occasionally the oil has blown back in this also.—Yours truly,

E. G. YOUNG.

[The trouble of the oil blowing back into the lubricating pipes and getting hot can only arise through a leak past one or more of the pistons. It may be very slight and not sufficient to noticeably affect the power of the engine, but quite enough to drive back the oil in the gravity-fed

pipes. We advise Mr. Young to have the cylinders removed and the pistons and rings carefully examined, and, if necessary, to have new rings fitted. At the same time the crowns of the pistons should be scrutinized for a possible blowhole; also the fit of the gudgeon pins in the pistons is a point that should not be overlooked. Perhaps the oil-pipes are fixed higher up in the cylinder walls than is advisable, so that pressure leaks direct into them past one or more rings when the piston is at the bottom of the stroke. Therefore the present holes can be plugged up and new ones drilled and tapped about one inch lower down. Instead of the ball valve that our correspondent has fitted, he would have done better to have put a copper vent pipe of large diameter projecting vertically from the crank chamber and fitted with a hinge cap, free to release pressure instantly.]

SMALL STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have pleasure in complying with Mr. Lyall Jackson's request in your last week's issue for more information concerning the reliability of small steam cars, and the length of life of their boilers, &c. I consider there is no more reliable car than a steamer, while their speed on the level and on hills is nearly double that of a petrol car of similar horse-power, and they do their work without "talking." There are no gears or clutches, or electrical connections, to get out of order, and the delight of driving a car which has none of these contrivances can only be appreciated by those who have experienced it. It is essential, however, when purchasing a second-hand car, to be sure that its vitals, such as engine, boiler, and running gear, are sound, otherwise there will be nothing but trouble to look forward to. A new boiler should easily last five years in constant use, if properly cared for and blown out regularly.

Steam cars are just as suitable for rough roads as any other car, and here again their life largely depends on their sound frame construction and the care exercised in running them over rough surfaces at suitable speeds. I am inclined to the belief that for long life on rough roads, as one has to contend against in country districts in Ireland, a car should be strongly built on a steel frame and nicely sprung, and not as some American firms turn out their cars. My personal experience has forced me to decide never again to have a steam car that uses petrol as fuel. In the first place it is highly inflammable and dangerous, and secondly the price of spirit is steadily rising.—Yours truly,

L. C. P. PERRY.

Major R.A.M.C.

WIRE OR WOODEN WHEELS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The most important point regarding the relative merits of metal and wooden wheels seems to have been overlooked. Much has been said about the employment of the cycle pattern of tangent wire wheels, but no one has, so far as I am aware, pinned his faith to the hollow metal spoked and metal rimmed wheel. I do not refer to mere castings, which are inadvisable where light weight and strength is requisite. In my own cars I always prefer to fit a special form of hollow metal spoked wheel, which I think all practical men will agree is at least as strong as any other kind. Not being on the tangent wire principle it resists buckling, and not being wooden but wholly of metal no shrinkage takes place, while the appearance is better than wood. I think, further, that this wheel fitted with a quickly detachable secondary rim, such as the Cave, is the beau-ideal of strength and simplicity.—Yours truly,

E. H. OWEN.

CARELESS 'BUS DRIVERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—At one of the stopping places of motor-buses in Peckham I have just witnessed an incident which, I am afraid, is only typical of what goes on to a very general extent. I was standing by the kerb smoking a cigarette, and noticed a continuous dropping from below the driver's seat of a motor-bus, which was halting there some minute. Steeping down I discerned that the liquid was petrol. Had I, or anyone else, thrown a lighted match, or the rejected end of a cigarette, the result would have been disastrous to the motor-bus. When I told the driver of what was happening, and of the danger he was in, he merely laughed and took no further notice.

In view of the lack of public knowledge of the dangers associated with many innovations now being made, steps should be taken to secure that those concerned with the direction of new methods should be convinced of the necessity of taking heed. The bus companies should emphasise the risks of petrol when allowed to escape in that way in the public streets, on drivers and conductors. Otherwise motor-buses may attempt to navigate the air—with results disastrous to all within the range of their activity.—Yours truly,

A. W. WHITE.

A MOTORIST writes, in appreciative terms, of the merits of the motor soap brought out by the Sanitas Company.

TYRE FOUND.—A new motor tyre was found on the road near Ascot on the 2nd ult., and is now at Ascot police station. Inquiry from the owner will be welcomed by Inspector Jannaway.

CLUBS AND ASSOCIATIONS.

AUTOMOBILE MUTUAL PROTECTION ASSOCIATION.

THE Finance and General Purposes Committee of the Association met at the offices, 109, Victoria Street, Westminster, S.W., on Wednesday of last week. The chair was taken by the Earl of Shrewsbury and Talbot. The secretary reported that he had examined all private bills deposited for this session, and had arranged with the Motor Union that opposition should be made to the Portsmouth and Hornsea Light Railway Extension Order, and the London County Council Tramways along New Oxford Street, as well as several new bridges and level crossings proposed in railway bills.

The secretary reported that the National Dustless Roads Committee had been formed to take over the work which had previously been done

Booth, A. Wright, F. K. Ward, Faulkner, H. A. Marshall, Sutton Clifford, Huskinson, J. W. Taylor, Stagg, Jeavons, F. Pochin, T. C. King, T. Gerrard, J. Hartopp, J. A. Doran, Ewart, L. Pierpont, H. C. Wright, Bircumshaw, Booth Granger (Nottingham), Allin and Leach (Derby), and Mr. A. McAlpin (hon. secretary of the Leicestershire Automobile Club).

The loyal toasts having been duly honoured, Sir J. Herbert Marshall proposed "The Automobile Club of Great Britain and Ireland, and the Motor Union of Great Britain and Ireland." He asked if they all realised the enormous amount of work which was being done by the Automobile Club in the interest of motorists and those who were interested in motor-ing. He knew the character of the work done by officials and individuals, many of whom devoted practically the best part of their lives to doing everything in the best possible way they could to bring the greatest amount of success to the great motor industry. One of the great features in connection with the two institutions was the fact that they endeavoured to promote the motor industry, which was a thing they wanted more than anything else at the present time.

Earl Russell, in acknowledging the toast, said that the Automobile Club did really try to conduct itself in the interest of automobilism as a whole. The Technical Committee did work which they could not get done by any other club except the Automobile Club, while the institution performed a great function in connection with competitions. It

Winter Motoring in the South of France. A Snapshot from Draguignan (Var).

by the Dustless Roads Joint Committee which was originally formed by this Association and the Roads Improvement Association. Lord Shrewsbury and Mr. Albert Brown were appointed to represent the Association on the National Dustless Roads Committee. Eight new firms were elected to membership.

The secretary was instructed to make arrangements to hold the annual general meeting at the Agricultural Hall, on Thursday, April 11th, 1907, at 2.30 p.m. The draft report and balance-sheet for 1906 was submitted, showing that the funds of the Association had increased by £102 in the year, so that the Association had nearly £1,000 placed to reserve.

LEICESTERSHIRE AUTOMOBILE CLUB.

THE annual dinner of the Leicestershire Automobile Club was held at the Grand Hotel, Leicester. The company numbered about 140. Mr. E. G. Mawbey, the president, occupied the chair, amongst those present being Earl Russell, Sir J. Herbert Marshall, Colonel Piercey, Major E. M. P. de Lisle (High Sheriff of Leicestershire), Mr. Rees Jeffreys, Messrs. Orson Wright, Maurice Mawbey, McAllister Hewlings, Dr. Partridge, Steinitz, Langmore, Goodwin, J. McAlpin, Wildt,

was of great importance to the movement that automobilists should be associated in their particular localities, for as far as political propaganda was concerned they were not yet out of the wood. They needed certain restrictions removed, and until they had their real and full liberty it was necessary they should work together. Mr. Rees Jeffreys (secretary of the Motor Union), submitted the toast of "The Leicestershire Automobile Club." He said he regarded the Leicestershire Automobile Club as one of the pillars of the Motor Union, and the position it occupied in this respect was due to the fact that it was composed of a body of sportsmen, and that it was fortunate in its officers. Having paid a tribute of praise to Mr. Mawbey and Mr. McAlpin, Mr. Jeffreys went on to refer to the question of taxation. Motors, he considered, were already taxed out of due proportion to any other class of road vehicle. The Motor Union had two objects of great importance, amongst others. In the first place it wanted to protect its members against vexatious prosecutions, and to defend them when they became victims to excessive zeal on the part of the police force. Another object was to put down the inconsiderate driver. They had adopted a new device to secure these objects. They were going to introduce a Motor Union badge, which was to be regarded as the badge of the considerate driver. They wanted

to make that badge an insurance against vexatious prosecutions, and to ensure that every member wearing that badge, if wrongly prosecuted, should be entitled to half his legal expenses provided by the Motor Union.

The Chairman responded, and pointed out that the Leicestershire Club had had a successful year with 140 members. He thanked the officers of the Leicestershire Club, and made particular reference to the work of the secretary, Mr McAlpin.

Mr. Orson Wright proposed "The Visitors," to which Major E. M. P. de Lisle and Mr. Sutton Clifford responded.

THE AERO CLUB.

THE Aero Club have completed arrangements, which have been in course of preparation for some considerable time, for the carrying out of a series of important practical experiments in connection with aerial navigation. These experiments will be subdivided into the following classes:—(1) Propellers; (2) Aeroplanes; (3) Engines. The experiments regarding propellers will be carried out by Professor Waynforth, the Honorary Technical Adviser to the Club, and the authorities of King's College, London, have kindly allowed the use of their engineering laboratory for the purpose.

Lord Howard de Walden has already given £100 to the Aero Club for experimenting purposes, and at a special meeting of the committee of the Club additional subscriptions have been obtained from the following members:—Messrs. F. H. Butler, E. Bucknall, Martin Dale, P. Alexander, Colonel J. E. Capper, C.B., R.E., Professor A. L. Hunt-ington, J. T. C. Moore-Brabazon, S. Spooner, Admiral of the Fleet Sir Edward Seymour, G.C.B., Hon. C. S. Rolls, and Roger Wallace, K.C.

As these experiments may involve the expenditure of considerable sums of money, it has been decided to invite further subscriptions, for which cheques, crossed "Barclay and Co.," should be sent to the Aero Club, 166, Piccadilly, London, W.

The Hon. Mrs. Harbord has just effected a long distance balloon voyage. Ascending, accompanied by Mr. C. F. Pollock, of the Aero Club, in her new balloon, "The Nebula," at Chelsea, on a recent Thursday, and favoured by a north-west wind, she crossed the Channel in the neighbourhood of Calais, and descended about 9.30 the following morning in a violent snowstorm at Stavelot, in Belgium, a small town about 15 miles to the south of Aix-la-Chapelle. The average speed of the balloon was about 25 miles per hour.

NOTTINGHAMSHIRE.

AN instructive lecture was delivered by Mr. Fred Thoresby, to the members of the Notts. Automobile Club, at a gathering at the Black Boy Hotel, Nottingham. His subject was "The Evolution of the Motor Car," and over 100 slides were shown. Illustrations had been obtained from all quarters. The history of the motor-car was traced up to the present time, particular attention being paid to those of the early and latter part of last century—from 1789 to 1841, and from 1882 to 1900. Steam was the force relied upon in the early examples, but from 1882 up to the present petrol had been mainly used. The first example of a petrol car was the Cugnot in 1789, and it was followed by the Trevithick, the Symington, and the Murdock. Mr. Thoresby also exhibited a complete set of slides illustrating the Gordon Bennett race from 1900, when the first event took place, to that of 1905.

NORTH YORKSHIRE A.C.

THE annual meeting of the North Yorkshire Automobile Club, which was formed a year ago, was held last week at the Station Hotel, York. Mr. H. A. Watson (chairman of the committee) presided, and other members present were Lord Deramore, Messrs. C. E. Hunter, Arthur H. Kerr, C. Wade, Lionel Saltmarsh, H. Strickland, S. Pearson, G. W. T. Wade, Colonel W. H. Mott, E. S. Wade, A. H. Barkworth, E. S. Angove, W. F. Greenwood, C. E. Wood, A. J. Walker, W. H. R. Hopkins, and Francis Ware (hon. secretary).

The balance-sheet, prepared by Mr. Edwin Gray, hon. treasurer, showed the income to have been £116 6s. 4d., including £99 15s. for subscriptions. After the payment of expenses a credit balance of £26 15s. 4d. remains. The balance-sheet was approved, on the motion of Dr. Angove, seconded by Mr. C. E. Hunter. The committee reported that an arrangement had been entered into with the Yorkshire Insurance Company for specially favourable terms for insurance being granted to members of the club. They had also been able to arrange for free casual storage at reduced terms of members' cars with the following garage proprietors:—North-Eastern Garages, Ltd., York; Mr. H. J. Lloyd, York; Hull City Garage, Ltd., Hull; Messrs. Wales and Sons, York; and the York Electrical Company, Ltd., York. The membership of the club on December 31st was 92.

Lord Wenlock was re-elected president of the club. The Marquis of Zetland, the Marquis of Ripon, and the Earl of Lonsborough were re-elected vice-presidents, and Lord Bolton was also elected a vice-president.

With regard to the committee, it had been arranged that the following elected members should retire:—Major R. L. Bower, Mr. T. N. F. Bardwell, Mr. A. J. Cholmley, Mr. E. Lycett Green, Mr. H. Harrison-Broadley, M.P., the Hon. W. Algar Orde Powlett, Mr. W. E. Meade, and Mr. A. C. Stamer. The last two had already tendered their resignation owing to having left the district. The committee nominated

the following members of the club to fill the vacancies:—Major R. L. Bower, Mr. H. Copperthwaite, Lord Deramore, Mr. A. E. Learoyd, Mr. Sutton H. Lowe, Lieutenant-Colonel H. C. Page-Henderson, Mr. P. M. Stewart, and Mr. G. W. T. Wade.

Following the annual meeting the first dinner of the club was held at the Station Hotel, York. Mr. H. A. Watson presided, and after the loyal toasts had been honoured Mr. A. W. M. Bosville proposed "The North Yorkshire A.C.," remarking that the lust of speed was decreasing. In reply, the Chairman said the North Yorkshire A.C. had always regarded the considerate use of the highways as a matter of importance.

Mr. C. E. Hunter eulogised the work of the Motor Union in proposing success to the organisation. Mr. Sturmeys reply and the toast of "Our Guests," responded to by the Lord Mayor of the city, brought the speechmaking to a close.

BRADFORD MOTOR-CYCLE CLUB.

A WELL-ATTENDED meeting of the recently-formed Bradford Motor-cycle Club has been held at the Royal Hotel, Bradford, Mr. G. E. Vint, of Idle, presiding. A further batch of new members was proposed, bringing the total membership of the organisation up to nearly sixty. The Chairman expressed satisfaction that the club had been established on a sound basis in so short a period. He congratulated Mr. Bernard Read, who has undertaken the hon. secretaryship, on having so successfully organised the new body. Rules were adopted and officers elected, and it was decided that the headquarters of the club should be the Imperial Hotel. Mr. T. G. Bullus, hon. treasurer, announced that Mr. T. Dyson had consented to give a valuable trophy to the club for annual competition. It was arranged that the first club run should take place on Good Friday to Richmond, where there is to be a meet of the principal motor-cycle clubs in the North of England.

SUSSEX A.C.

ON Saturday the annual meeting of the Sussex A.C. was held at Warne's Hotel, Worthing, with Mr. C. Scrase Dickens, J.P., in the chair. The committee's report showed that the club was in a very satisfactory position, although the membership had decreased slightly. They had succeeded in getting a warning board erected at Handcross. Regret was expressed at the retirement of Mr. W. James and Mr. M. F. Mievill from the presidency and secretaryship respectively.

It was resolved to ask Mr. James to reconsider his decision as to the former office, and Mr. Mievill having explained that, owing to ill-health, he could not continue as secretary, Mr. F. H. Nye, of Broadwater Manor, Worthing, was elected in succession. On the motion of Earl Russell, it was resolved:—"That the committee be authorised to make arrangements for the club to be worked in two sections—East and West Sussex—if it is considered advisable that the club should be so divided." It was resolved that Earl Russell and Mr. Myddelton-Gavey, of Tonbridge, should represent the club on the General Committee of the Motor Union.

Replying to a vote of thanks, the Chairman thought that in such a large county as Sussex more interest ought to be displayed in the work of the club. The club's funds and influence were at all times available for members when they had any grievances or legal difficulties, or when they required any information.

LADIES' A.C.

MR. CURRIE, the Ladies' Automobile Club engineer, has just concluded his fourth course of technical lessons. These lessons, each of which had on an average an audience of some twenty-five of the members and their friends, were, with the exception of the last, held in the Red Room of the club. All the lessons were well illustrated by many "parts" of both new and old design, among these being a modern four-cylinder engine complete with all the latest improvements. The final lesson was a *resume* of all the preceding ones, and, as it required a complete chassis in order that members might be enabled to see the assembled parts in place, Messrs. Warwick Wright, Ltd., of 110, High Street, Marylebone, very kindly placed at the disposal of the club a large room, a six-cylinder Minerva, and an example of the Cave detachable rim.

IRISH A.C.

THE annual general meeting of the Irish Automobile Club took place on Wednesday of last week at the headquarters, Dawson Street, Dublin. Sir William G. D. Goff, Bart., D.L., J.P., chairman, presided. The hon. secretary submitted the annual report, which showed the club to be in a highly satisfactory condition, and referred to the success that attended the various competitions held throughout the year, making special reference to the fact that His Excellency the Lord Lieutenant and the Countess of Aberdeen attended the opening ceremony at the club garage on April 30th. The statement of account which followed showed the club to be in a sound financial position, over 180 new members being elected during the past year, bringing the total up to 450.

The Chairman, in proposing the adoption of the annual report and statement of account, took the opportunity of making, on behalf of the members of the club, a presentation to the hon. sec., Mr. E. White, for his services to the club and his earnest work in the interests of the sport and pastime of motoring. The presentation, consisting of a valuable silver tea service and an old Sheffield silver salver, was

handed to Mr. White, who replied in feeling terms to the generosity and kindness extended to him by the members.

The election of officials for the coming year resulted in all the hon. office holders being elected as follows:—President, Right Hon. Sir Horace Plunkett, K.C.V.O.; vice-presidents, the Marquis of Waterford, the Earl of Drogheda; chairman, Sir W. G. D. Goff, Bart.; vice-chairman, T. Talbot Power; hon. treasurer, Walton Sexton; hon. sec., E. White. The following were elected on the committee:—Messrs. T. Plunkett, D. E. Magor Wallesey, R. J. Meccredy, F. W. Perry, J. M. Davies, Hum Bland, J.P., J. B. Dunlop, jun., F. H. Hall, W. S. Hayes, C. W. Seagrave, G. O'Grady, T. Henshaw, J. C. Percy, J.P., T. J. Consedine, Colonel Chaulver Knox, C. Wisdom Hely, J. E. St. George, H. S. Close, Pryce Peacock, M.D., and F. Morgan Mooney.

MOTOR YACHT CLUB

At the last meeting of the committee of the Motor Yacht Club it was decided to offer a challenge cup for the best cruise of the year in a privately owned motor-boat, and the matter was referred to the Races Committee to draft the necessary regulations.

A special meeting of the committee was held last week to consider the formation of a class of small one-design motor-boats for the Solent. It is proposed that the boats shall be of a staunch cruiser type, but provided with sufficient power to give them a fair turn of speed for their size. Weekly or fortnightly races would be held in Southampton Water and the boats would be available at other times for day cruising. By building, say, half a dozen of these little vessels it would be possible to obtain a very useful boat at a very moderate price, and the scheme should help to secure many new recruits to motor-boating.

THE CRYSTAL PALACE.

THE A.C.G.B.I. has given approval to the Crystal Palace A.C.'s intention of holding a Flexibility Trial on Saturday, the 23rd inst. There will be a run of about 60 miles, then an interval to have a fast and slow race, followed by a run back of another 60 miles. A maximum number of marks will be allotted, and any deviation from the top gear will incur a penalty which will be deducted from this mark allowance.

MR. C. STEWARD, 92, Bromley Street, Stepney, E., is hon. secretary of the Black Prince Motor Club.

OF the 127 members of the South West Ham Rovers Cycling and Motoring Club, thirty-three are motorists.

BETWEEN thirty and forty members of the Woolwich and District Motor Club were present at the annual dinner, over which Mr. B. Hardcastle presided.

AN association of northern users of motor-lorries and vans has been formed, with Councillor Kay, J.P., as chairman, and Mr. J. Miller, 295, Deansgate, Manchester, as secretary *pro tem*.

THE slow race up hill organised by the Motor Cycle Club for July 13th will be divided into two classes—one for single geared motor-bicycles and the other for machines with change-speed gears.

THE Kent A.C. has offered a gold medal to the candidate obtaining the highest relative number of marks in the examination for the Mechanical Proficiency certificate by the A.C.G.B.I. at Maidstone in April.

MOTOR-CAR ACCIDENTS.

AN army pensioner, who acted as caretaker of the Volunteer drill hall at Guildford, was on Saturday night knocked down by a motor-car whilst he was walking along the middle of the road between Guildford and

The Lewisham A.C.'s Hill-Climbing Competition—Some of the Competitors at Hildenborough.

was The annual general meeting of the club took place on Thursday of last week. Lord Montagu of Beaulieu was elected Vice-Commodore in the place of Sir Boverton Redwood, who has been compelled to resign the post through press of business.

BRITISH MOTOR-BOAT CLUB.

THE annual general meeting of the club was held on Thursday of last week, when there was a good attendance. The report of the committee stated that the membership had steadily increased, and that the club had offered for competition prizes, cups and gold medals to the value of over £800. The Commodore, Admiral Sir William Kennedy, Vice-Commodore, the Marquis of Ailsa, Rear Commodore, Mr. W. Miall Green, and hon. treasurer, Mr. Oswald B. Colls, were re-elected with acclamation. The following will be the committee for the forthcoming season:—Messrs. A. Harden, Capt. W. Windham, J. S. Holmes, F. R. Simms, Lieut. H. G. Vereker, C. Jarrott, G. de Holden Stone, F. B. East, Oswald B. Colls, W. Lawrence, G. Neill, F. C. Blake, N. B. Kenedy, E. Owers, Mawdsley Brooke, L. Miles, W. Miall Green, L. Stroud, Seaton Edge, Lieut. Markham, L. M. Waterhouse, A. Lee Guinness, F. May, J. A. Smith, K. O. Searle, E. W. Shave, C. G. F. Loder, J. Day, P. Bonthron, W. Scott Hayward, and P. Lowcock.

NAVAL MOTOR.

THIS club, of which Lt. Groves, of H.M. Submarine Depot, Gosport, Hants, is hon. sec., has now forty members. Several important fixtures have been made for the coming season, including an A.C.G.B.I. examination at Portsmouth.

Shalford. When the motorist got out he found the man was dead. No blame is attached to the driver, who was going slowly and the hooter was being sounded.

A VERDICT of "Accidental death" was returned at the Lambeth Coroner's Court at the inquest on the body of Harry Killmaster, aged 10, who was knocked down in Vauxhall Bridge Road by a motor-car, in which the traffic manager to the London County Council was riding. The evidence showed that the boy, who had just left his father's house to play with some companions, ran from the pavement into the motor-car, the driver of which sounded his horn and swerved across the road. The mudguard struck the boy, who was taken to St. Thomas's Hospital in the car, where he died an hour later, the cause of death being an extensive fracture of the skull.

A COLLISION between a cyclist and a motor-car belonging to Messrs. Carter, Paterson, and Co. took place at Old Steine, Brighton, whereby the cyclist received an injury to his right temple, being thrown off his machine.

A SERIES motor accident occurred in Edinburgh on Tuesday. Dr. Alexander Brown Walker, of Glasgow, and Mr. S. F. Ross, a motor-car agent, of Glasgow, were proceeding from Glasgow to Gullane when, on the Regent Road, Edinburgh, something went wrong with the steering-gear, and before the brakes could be applied the car dashed into an iron railing surrounding a tree, smashing the railing and uprooting the tree. The car then dashed against an electric lamp-post and overturned. The motorists were discovered by a cyclist about a quarter-past six in an unconscious condition. Both were removed to the infirmary, and it was found that Ross had a leg broken and other injuries, while the condition of Mr. Walker was found to be very grave.

THE WORK AND WORRIES OF CAR PARTS.

DOES the average owner, as he calmly steers his way, ever realise the maelstrom of forces which are developed in the different parts of his car? To all outside appearances it moves with as little effort as a soaring gull, making no noise save a gentle purring which reminds one of the domestic feline in its more contented moods. Below this peaceful exterior, however, pandemonium reigns supreme. Temperatures which can easily melt the most refractory metals have to be kept within bounds; pressures of immense magnitude and frightful suddenness are robbed of their destructive force, and peacefully give up their power, while crashing impacts between moving parts are incessant. Science itself can hardly keep pace with the many-sided problems. Engineering has been set tasks previously deemed impossible.

To begin with, just fancy what a cylinder has to do. In a two-hundredth part of a second the pressure rises 320 lbs. per square inch, and the temperature about 2,000 deg. Fabr. Now to stand these conditions a high grade nickel-steel would be a very good material, but the complexity of shape practically forces the engineer to use cast-iron, which has a low melting point, and is about the last metal in the world which would be selected to stand sudden and frequently applied blows. It is no easy task to successfully fulfil the conditions. Most iron-founders undertake the order with the idea that with extra care in moulding and metal they can produce a satisfactory petrol engine cylinder. It is only when they receive from 30 to 40 per cent. of their output back again that they realise that they have yet got a lot to learn before they can produce this, the highest product of the founder's art. As a matter of fact, remarks Mr. Allan Coates, B.Sc., in the Argyll Co.'s publication, "The Motorist," there are exceedingly few firms in this country who produce satisfactory cylinders with any regularity. Minute specks which require a concentrated light to discover are sufficient to condemn a cylinder; for a high-class firm cannot afford to take the risk of particles of sand eventually being dislodged, owing to the high temperature, vibration, and oil, with the result that the piston seizes and the cylinder is badly scored. The metal must be just not too hard to cut, and yet very hard in order to wear well; also the unmachined parts at the top and round the valves must be perfectly smooth, with no projecting parts to heat or holes to gather soot.

The wretched piston, too, leads a dog's life. One talks of there being no rest for the wicked, and judged by that standard a piston must have had a fearful past. Forty times every second is it started on its wild career, and no sooner has a decent speed been attained than the order goes forth to come back again, and although prompt obedience is the unvarying rule, the only reward is to get a terrific two-ton bang on the head that nearly shatters it; and, as if that was not enough, it is at the same time hurled violently against the opposite side of the cylinder with force enough to knock most things silly. Here again steel is naturally a better metal, but the practical difficulty is to make it the necessary shape, though there are possibilities of advance in this direction. The same care must also be taken of the castings here. A single grain of sand coming out of a blown hole is quite able and willing to seriously damage both cylinder and piston. The top must also be smooth and free from minute holes, else soot might gather and cause pre-ignition. Care must be taken in design that there is sufficient metal to carry away the heat from the centre of the piston head.

As for the gudgeon pin, it is doubtful if in all engineering there is a more severely tried bearing. Scorching heat radiates on it from every side, and, owing to its cramped position, the bearing surface is cut down to a minimum; and, to crown all, oil, to ease its torments, can only be supplied sparingly, and is indeed difficult to supply at all. This is the most accurate fit in the whole car. The pin must be glass hard, true, and polished; the connecting rod bearing of the finest phosphor-bronze, reamed true and smooth. The thousandth of an inch is not good enough here; half that amount is all that can be thought of, and the result is that this most difficult part seldom gives trouble.

The connecting rod bottom has difficulties of a different kind, chief of which is finding the crank pin not quite circular. By this is meant that it must be mathematically true. Now, by an unfortunate coincidence, the crank pin happens to be the one part of a car that is difficult to make quite circular. The overhang is great and the shaft springy, and with ordinary methods only an approximation can be arrived at. The final truing up is a long and tedious process.

The crank shaft is the despair of the automobile engineer. Endless attempts have been made to cheapen it, but the bending, twisting, and pounding which have to be endured, with a design obviously unsuited to such treatment, allow no alternative but to use the highest grade nickel or vanadium steel, and plenty of it.

The gear-box is in some ways the hardest worked part of the car. Each tooth has to take up and drop a load of several thousand pounds, and only gets about one three-hundredth part of a second to do it in. One might as well take a large hammer and lay into them for all one is worth. When we remember what a noise is caused by even a light tapping of one piece of metal on another, it seems wonderful that gears can be so noiseless as they are. The teeth must be cut with extraordinary accuracy. The slightest space between them at once sets up an unendurable noise; even one tooth being two-thousandths thicker than its neighbour is distinctly noticeable. Fortunately in case-hardened steel we possess a material admirably adapted for the purpose, the

outside hard shell withstanding the heavy pressures, while the tough inside prevents the teeth from being so brittle as to break off. What the teeth have to suffer owing to unskilled handling no words can tell.

Go open the inspection lid,
Look at the gears that have been slid,
Think of the man the deed who did,
Hope that through shame his face he hid!

THE FIRST HILL-CLIMB OF THE SEASON.

THE Lewisham A.C. held the first motor competition of the season on Saturday last at River Hill, the event being an open handicap for tri-cars and motor-cycles. Of the forty-six entrants thirty-eight actually started. In the results given below the winner's time is represented by zero, the figures credited to other competitors being the difference between their time and the winner.

In Class 1, for motor-cycles with single-cylinder engines, the result was:—

Place.	Rider.	H'cap.	Machine.	Net Time.
1st	R. M. Brice	Scr.	3½-h.p. Brown	zero.
2nd	C. H. Gold...	4 sec.	4-h.p. (Stevens) Rip	1 sec.
3rd	F. W. Applebee	7 sec.	3½-h.p. Rex	9 sec.
4th	W. W. Genn	4 sec.	3½-h.p. Minerva	14 2-5 sec.
5th	Webb	5 sec.	3½-h.p. Quadrant	30 sec.
6th	W. Goelett...	5 sec.	3½-h.p. N.S.U.	35 4-5 sec.

Class 2 was for motor-cycles with two or more cylinder engines, and the presence of Miss Muriel Hind gave added interest to the event. She, however, only obtained ninth place, other competitors being as follows:—

Place.	Rider.	Handicap.	Machine.	Net Time.
1st	C. R. Collier	Scr.	6 J. A. P. Matchless	zero.
2nd	O. C. Godfrey...	5 sec.	5 Rex	3 3-5 sec.
3rd	W. H. Wells	Scr.	5 Vindec Special	10 3-5 sec.
4th	W. Getting	10 sec.	5½ N.S.U.	11 2-5 sec.
5th	W. A. Jacobs	10 sec.	5 Rex	11 4-5 sec.
6th	A. C. Pritchard	7 sec.	5 Rip	12 2-5 sec.
7th	M. Greger	Scr.	6 N.S.U.	12 3-5 sec.

Mr. Collier's machine was fitted with Dunlop tyres.

The tri-car class brought ten entries, a lady entrant winning the silver medal. Those placed were as follows:—

Place.	Rider.	Handicap.	Machine.	Net Time.
1st	Bert. Pattison...	Scr.	16 Daneville	zero.
2nd	J. Browning	10 sec.	9 Riley	5 sec.
3rd	Mrs. Hilda B. Hewlett	15 sec.	10 Lagonda	19 4-5 sec.
4th	Wilbur Gunn...	10 sec.	10 Lagonda	30 4-5 sec.

COMPANY NEWS.

NEW COMPANIES REGISTERED.

NON-EXPLOSIVE GAS SYNDICATE.—£5,000. Agreement with Mr. T. G. Payne and Mr. F. J. Cox. First directors: Messrs. T. G. Payne, F. J. Cox, and others to be appointed by signatories.

AUTOMOBILES DE LUXE (WEST END AGENCY).—£2,000. First directors: Mr. P. Baxter and others to be appointed by subscribers.

PERRY, THORNTON, AND SCHREIBER.—£10,000. To adopt an agreement between the Central Motor-Car Company, Limited, and Mr. W. J. Longley, and to carry on the business of manufacturers of and dealers in motor-cars, &c. First directors: Messrs. P. L. D. Perry, B. M. Thornton, and W. E. B. Schreiber. 117-119, Long Acre, W.C.

EAST LANCASHIRE MOTOR TRANSPORT COMPANY.—£2,000. To take over the business of general carriers carried on at Church, Lancashire, by Messrs. J. W. Bowker, J. J. Sayer, J. Pilkington, J. J. Miller, S. Walsh, M. M. Williamson, and Mrs. I. A. Sefton, as the East Lancashire Motor Transport Company. First directors: Messrs. J. Pilkington, J. J. Sayer, J. J. Miller, J. W. Bowker, and S. Walsh. 18, Cemetery Road, Church, Lancashire.

HORLEY MOTOR AND ENGINEERING COMPANY.—£10,000. To take over the business carried on by Messrs. L. H. Hodgson and E. Dewhurst, at Horley, Surrey, as the Horley Motor and Engineering Company. First directors: Messrs. H. L. Hodgson, E. Dewhurst, J. E. Wilson and H. G. Wilson.

LUDFORD MOTOR-CAR HIRE COMPANY.—£1,000. First directors: Messrs. R. P. Mitchell, S. Jackson, and A. E. Murrell. 6, Ludford Street, Grimsby.

VICTORY TYRE AND RUBBER COMPANY.—£10,000. To adopt an agreement with Mr. R. Lord for the acquisition of the business of an indiarubber manufacturer and dealer carried on at Sudell Works, Tontine Street, Blackburn. Mr. R. Lord is permanent director, with power to appoint other directors. 24, Tontine Street, Blackburn.

CONTINENTAL MOTOR-CABS.—£400,000. To manufacture, buy, sell, and let on hire motor-cabs, &c. 5, Copthall Buildings, E.C.

ARA.—£6,500. To acquire any inventions relating to indiarubber or compounds thereof, to the repairing of indiarubber articles, or to the manufacture of goods from indiarubber and its compounds. 33, Chancery Lane, W.C.

ON SELECTING A CAR.*

BY ALFRED TOWLER, M.I.MECH.E.

ASSUMING our man of moderate means can afford to spend from £60 to £200 per year on motoring, including interest, depreciation, insurance, housing, running expenses, and maintenance, what ought he to pay for his car? If he can only afford the lower figure, he must be satisfied with a second-hand small-powered car, buy and sell it well and do his own driving, cleaning and minor repairs. If, however, he can afford more, he may get a reliable single-cylinder for £250 or a four-cylinder car of modest power for £350, and he will probably find his running expenses pretty much in the same proportion.

It cannot be denied that the popular car is one with a multi-cylinder engine, with a honeycomb type radiator and side entrance body, and, as the saying goes, "You might as well be out of the world as out of the fashion." But it may be asked, "How does this affect a man of moderate means?" A four or five seated car with side entrance, to be as strong as a similar seated tonneau car, weighs from 2 cwt. to 3 cwt. heavier than the latter, and as the additional weight is usually carried on the same size and strength of tyres, tyre troubles are more frequent. Again, moderate powered multi-cylinder cars are usually from 50 per cent. to 100 per cent. more powerful than single-cylinder cars and capable of going 25 per cent. faster, which involves greater strain, necessitating a stronger structure, increased weight and a heavier tyre bill.

Either some of the motor-car manufacturers who are catering for the popular priced multi-cylinder car buyers for 1907 seem to have placed a four-cylinder engine on a single-cylinder chassis, or some of the firms of longer experience and higher catalogue price continue to make their chassis much too strong. It may be found that the lighter cars may be strong enough for the expert driver who handles his car humanely, but what about the other man? The safest, and perhaps the cheapest, thing for him to do is to wait until the stronger car becomes second-hand.

With regard to repairs, I would remind you of the proverb "A stitch in time saves nine," and assure you that it applies to every detail appertaining to a motor-car. Some tyre troubles no amount of observation and forethought can prevent, but probably 90 per cent. of other involuntary stoppages can be prevented. Overhauling, however, is a more serious matter and should be done periodically, at least every 3,000 miles. A practised ear can generally detect any unusual or abnormal sound, and the cause should be sought at once. I believe there are a great many owners of cars who are very fond of motoring, yet possess very little mechanical aptitude, and this applies, I fear, to some paid drivers. It is needless to say a car is greatly handicapped in such hands.

It seems to me that the purchaser of a car is often unduly influenced by the number and size of the cylinders. If all manufacturers' details were the same for cars of equal selling price, such a preference would be reasonable. Objection is sometimes taken to what is termed "paying for a name," but it must be admitted that no firm can obtain a high reputation without earning it, neither can a firm of repute rest upon its laurels. Again, it follows that a firm who can manufacture cars in large numbers has an advantage in cost of production over another firm who can only turn out cars in small numbers, assuming that the methods of production are up-to-date. Therefore, the former, if they choose to, are in a position to give better value. The most reliable guide as to the relative value of different makes of cars that I know of may be got by a careful perusal of second-hand cars given in current Motor Journals, and the results tabulated. It will be found that cars made by different makers of approximately equal selling price when new depreciate very unequally. By this means anyone may satisfy himself as to which are the desirable cars to buy from this point of view.

CASES UNDER THE MOTOR-CAR ACT.

EXCEEDING SPEED LIMIT.

At Shoreham (Sussex) Petty Sessions, on Monday, Alfred James Du Cros, of Regent Street, London, was fined £8 10s., including costs, for driving a motor-car at an excessive speed at Southwick on February 17th. Witnesses for the prosecution put the speed at between 25 and 35 miles an hour. The defendant pleaded not guilty, and said the road was clear. He had no speed indicator, and could not fix the pace at which he was travelling. He added that he had been continuously driving since the earliest days of motor-cars, and had never been in trouble before.

RECKLESS DRIVING.

At Gateshead, Duncan Campbell has been charged with having driven a motor-car at a dangerous speed in Durham Road on January 14th. It was alleged that the defendant's speed was about twenty-five miles an hour. Mr. C. Ritson, who defended, complained that, owing to the wording of the summons and the fact that the car was not stopped, the defendant would have been unable to call any evidence if he had wished to do so. He was charged with having driven a car at a dangerous speed in a road which was three miles long. The police authorities, he knew, could not have issued the summons in any other form, but it would be better if they were allowed to state in the summons the particular point at which the offence was alleged to have taken place. The magistrates imposed a fine of £5 and costs.

*From a paper read at the Yorkshire Automobile Club, Hotel Metropole, Leeds, on the 26th ult.

SOME INTERESTING IGNITION EXPERIMENTS.

At a recent meeting at the Automobile Club of Great Britain and Ireland, Professor W. Watson, D.Sc., F.R.S., read an interesting paper under the title "The Effect of the Character of the Spark on the Power Developed by a Petrol Motor." We have not space to print the whole of the paper but give below a summary of the author's conclusions as based on the results he obtained in the experiments carried out. In his opening remarks Professor Watson mentioned that it appears to be a commonly accepted opinion that a strong or "fat" spark is better than a weak one, when used to ignite the charge in a petrol motor, and that there can be no doubt that in the case of most engines the power developed is considerably greater when the voltage of the ignition battery is well up to its normal value than when the battery has run down, although the engine continues to fire regularly. Not feeling satisfied as to the cause of the above, and not being able to find the record of any direct experiments, the author made a series of tests on a double-cylinder engine having a bore of 3.5 in. and a stroke of 4 in. The inlet valves were mechanically operated, and both the inlet and exhaust opened into a pocket on one side of the cylinder head. The sparking plug screwed into the cap used to close the hole over the inlet valve, the spark points being well inside a recess in this cap. All the experiments were made on one cylinder only, the other working with the trembler coil ordinarily employed with the ordinary four-volt battery. The speed at which the engine was run varied between 950 and 1,000 revolutions per minute.

Mr. R. Ramsbottom, of the Sportsman's Depot, Manchester, has sent us the photograph reproduced above of a 10-h.p. Single Cylinder Cadillac successfully making the ascent of Junction-street (Stony-brow), behind London Road Station, Manchester. The grade, which is said to be one of the steepest in Lancashire, is 1 in 51, with a portion of 1 in 41. On one trip up the hill the vehicle was stopped half way for the photograph to be taken, and afterwards completed the ascent, although carrying a full load of four persons.

The conclusions drawn by Professor Watson from the experiments he made are as follows:—

(1) As far as a petrol engine of the type used is concerned, the character of the spark which ignites the charge has no appreciable influence on the power developed.

(2) With a trembler coil the time at which the spark occurs is liable to vary greatly, and on this account the power developed may be considerably reduced.

(3) The variation in the time of firing obtained with trembler coils is different for different coils, and hence a multi-cylinder engine in which a separate coil is used for each cylinder is unlikely to develop its maximum power, particularly at high speeds; the reason being that although the tremblers of the coils may possibly be so adjusted for some particular voltage that each cylinder fires at the same point of the stroke, yet this adjustment will no longer be true if the voltage of the battery alters, particularly if it falls much below the value for which the tremblers were adjusted.

(4) When a single coil is used in combination with a high-tension distributor, it is of very great importance that the current in the primary should never be allowed to fall to a value near what has been called above the critical value for the particular coil. In this connection it may be mentioned that, in the author's experience, when the trembler is so adjusted for any given voltage of the battery, i.e., for a given

current, that the note produced is very clear and "pure," then a very slight decrease in current, due to a small fall in the voltage of the battery, will cause the timing to be defective, owing to the region of the critical current being approached. Hence, with the normal current passing—i.e., with the battery fully charged—it is advisable to adjust the trembler so as to give a somewhat harsh and shrill sound, for then the current may be considerably reduced before the critical value is reached.

(5) When selecting a coil, regularity in the working of the trembler for considerable variation in the current passing in the primary is of more importance than length or fatness of spark. Further, a coil taking a small current is to be preferred to one taking a large current, since trouble with the adjustment of the trembler blade will be decreased, owing to the reduced sparking at the platinum points with a small current.

(6) Except for the fact that the engine cannot be started on the switch, the plain coil with a rapid break on the two-to-one shaft seems preferable to a trembler coil, since over a very large range of current—in fact, whenever the current is large enough to cause the passage of a spark in the cylinder—the timing is exactly the same. The advantage of the trembler might be retained by using a switch, so that after the engine is started the trembler can be cut out, allowing the coil to act as a plain coil, a second condenser being provided.

STEAM v. PETROL.

AT the A.C.G.B.I. last week a discussion on steam v. petrol was introduced by Mr. Frederic Coleman, Mr. W. Worby Beaumont being in the chair.

The advantages of the steam car from his point of view were set forth by Mr. Coleman as follows:—The fact that the products of combustion are not introduced into the cylinder, and thus do not come into contact with any moving parts of the mechanism, which effects a saving of the wear and tear due to the introduction of carbon and other impurities into the engine cylinders. None of the working parts of the external combustion engine are subjected to the full heat of combustion, which is the father of the internal combustion engine's water jacket. The internal combustion system requires but one simple combustion chamber, with its steadily burning pilot lamp, while the internal combustion system is burdened with four, six, or eight independent combustion chambers, each of which must have its own particular pilot lamp in the shape of a sparking plug, with all the attendant electrical apparatus necessary to light and extinguish each one of these pilot lamps many hundreds of times per minute. The one external combustion chamber referred to is kept at a practically steady temperature, which in itself is an advantage in system when one considers that in each twentieth of a second the internal combustion chambers—four, six, or eight, as the case may be—must change from a temperature a little above that of the atmosphere to a temperature of nearly 3,000 deg. Fahr. The fact that with this external combustion chamber there is a storage of energy which enables the car to be restarted after stopping without recourse to the starting handle, that inevitable adjunct of the internal combustion chambers, no matter if their number be four, six or eight. The surety derived from the continuity of the combustion in this external combustion chamber, in contradistinction to the essentially intermittent combustion of the four, six, or eight internal combustion chambers, which has called into being the delicate and intricate timing systems, and even brought forth those marvels of latter-day ingenuity, the patent synchronised ignition systems. There is also the lack of necessity in the external combustion system for care as to the richness of the actual combustible mixture, which is an ever-present factor in the operation of the internal combustion system. And, finally, the total elimination on the part of the external combustion engine of the Otto cycle.

Mr. Dugald Clerk opened the discussion. He thought that Mr. Coleman had a little misapprehended the tests made in this country with petrol engines. He gave petrol engines some slight advantage in consumption, but it was common knowledge that a gradual improvement in the consumption of the petrol engine had taken place during the last few years. With any good modern petrol engine, provided the carburettor was properly adjusted and everything in good working order, a consumption of about .08 gallons per b.h.p. should be got. Mr. Coleman might take it from him that any good petrol engine of, say, 30-h.p. would be able on the bench, not on the road—because it must be under the same conditions as the White engine—to give .01 per gallon per b.h.p. per hour at the maximum power. There was no doubt at all that the economy of the steam engine could be greatly improved by sufficient superheating, working at sufficiently high pressure. But, taking the steam engine at its best, and taking the petrol engine at its best, he thought the steam engine would never be able, as a steam engine, to give an efficiency greater than one half of the thermal efficiency of the internal combustion motor. The internal combustion motor at present gave 35 per cent. efficiency, but the best the steam engine could do even with very large engines was something like 15 per cent.

Mr. Ashton Jonson approached the subject entirely from the point of view of an amateur, but he would like to say that he had bought a White steam car in which he had never yet failed to reach home. As to the reliability of running, whether he had ten, twenty, or thirty miles to run, he could always calculate to within five minutes the time when he arrived. So much for the reliability of that engine, which only required the burner to be properly adjusted. As to ease of manœuvring

if the White steam car had to turn round in a narrow lane it was so much simpler to manage than the petrol car, which made a great fuss about reversing.

Lieut.-Col. Holden, Professor Boys, Sir James Duke, Messrs. J. S. Critchley, A. G. New, Mercer Adams, O. Thompson, P. Dawson and Heckstall-Smith having spoken, Mr. Coleman replied expressing the hope that the Club would give a sufficient chance for competitions between steam and petrol.

ROAD REPORTS.

NORTHAMPTON.—The Northamptonshire A.C. has been considering the unsatisfactory way in which the main road from Northampton to Welby has been repaired, and the attention of the County Council is to be called to the matter.

SOLIDIFIED TAR.—Attention is being called by the Tar (Patents) Solidifying and Distilling Company, Ltd., 15, Mansion House Chambers, 11, Queen Victoria Street, E.C., to their system of solidified tar, which is claimed to render tar economically applicable to road-making, &c. By this process the tar is made easily portable, an important consideration in view of the favour with which it has been regarded in connection with the mitigation of the dust nuisance.

SUSSEX.—There are 572 miles of main roads in Sussex, or eleven times the whole of the distance from London to Brighton. The outgoing on these, together with district roads and bridges, for 1905-6, was £55,172 in East Sussex and £19,495 in the western division.

NORWICH.—The work of road repairs in Norwich, which Mr. A. E. Collins, the City Engineer, tries to distribute evenly throughout the year, has been disorganised by reason of prolonged frosts. Consequently, for the next few weeks these operations will have to be conducted on a larger scale than is usually the case. Every endeavour will be made to avoid having any considerable length of main road broken up at one time.

PUBLIC MOTOR SERVICES.

THE recommendation of the Watch Committee to grant licences to six motor-cabs to ply in the streets of Chester has been rejected by the City Council.

A SYNDICATE desirous of establishing a motor-omnibus service in Blackpool and runs into the country by motor char-à-bancs have approached the Watch Committee with the object of obtaining licences. The Committee, however, have declined to entertain any such application.

BUSINESS NEWS.

LORD PORTARLINGTON has placed an order with the Daimler Company for a 45-h.p. 9½ feet wheelbase chassis, and Sir Victor Horsley one for a car of similar power with 10½ feet wheelbase.

FROM the London and Parisian Motor Company, Ltd., comes a copy of the 1907 catalogue of Hotchkiss cars, which gives full particulars and illustrations of the four and six cylinder vehicles now being turned out by the Hotchkiss Company.

USERS of Rover cars should obtain a copy of the Useful Hints the Rover Company, Ltd., have issued with regard to the running of their vehicles.

COL. R. E. CROMPTON, C.B., writes:—"I saw a small car come out of Young Street into the Kensington High Street at a good speed and turn sharply round to the right, so as to draw in close to the wrong side, i.e., the near side of the road. As I saw the man make the turn I said he was perfectly certain to make a swing. To my surprise he did not swing, and the tracks left by the wheels were extremely sharp under the stress of a side movement. I went up to the car to note the tyres used, and to my surprise they had no projections or metal points of any kind, but only Palmer tyres with the square tread. I spoke to the driver and he told me that his experience was remarkably good, and that all that was required with these tyres was to keep them pumped hard to invariably obtain the same results."

THE Standard Metal Engraving Company have removed to Buchanan Buildings, 24, Holborn, E.C.

WE are informed that Iris Cars, Ltd., are about to open a London depot at 7, 8, and 9, Bird Street, Oxford Street, W., adjoining the depot of the "Times" Book Club. The premises comprise well-lighted show rooms, a good suite of offices, and a large basement.

A NEW depot for the sale of Horch cars is being opened at 34, Shaftesbury Avenue, W.C., by Horch Motors, Ltd. It will be remembered that it was a vehicle of this type which won the Herkomer touring trophy contest last year.

To give some idea of the immense stock large motor companies are compelled to carry, Messrs. Argyls London, Ltd., announce that they have over 20,000 spare parts which they can supply at a moment's notice from their premises in Newman Street, Oxford Street, W.

THE Daimler Motor Company announce that they have secured the sole manufacturing rights for the world (except France) of the Renard train, which will be on exhibition at the Daimler Stand at the Commercial Vehicle Exhibition, Olympia.

1907 MODELS of the Peugeot car can be seen at Messrs. Friswell's establishment at Regent's Park, N.W.

THE Motor-Car Journal.

COMMENTS.

THE Automobile Club of Great Britain and Ireland will no longer disport itself under that comprehensive title, but has emerged from its earlier state into the Royal Automobile Club. Ireland is omitted in the new designation, and Scotland's recognition in Britain finds no place in the exalted cognomen of the club. This, however, need cause no discussion, for both parts of the Empire now enjoy the benefits of organisation in clubs that have secured the right to represent

Motorism within their areas, while all parts of the Empire will gladly acknowledge allegiance to the Royal Automobile Club. This is becoming more and more comprehensive of the great movement within the British Empire, and clubs from the colonies and the great dependency of India are seeking association with the parent organisation. All this is to the advantage of motorists everywhere, for the close touch into which the various associations are now getting with each other will secure the possibility of uniformity in legislation wherever the Union Jack flies.

The Brooklands Track.

It is unfortunate that the opening of the Brooklands Motor Course, which was originally intended to take place a month after the Cordingley Motor Show, will not be available till July. It has now been decided that the opening meeting shall take place on the first Saturday in that month, entries closing on the 25th of the preceding month. The events notified in the *M.C.J.* of December 22nd last will be run off with the exception of the Naval and Military Plate, which will be omitted to make way for a special race for amateurs. An event for steam cars has also been added to the programme; although under a classification that seems very inadequate and hardly like to appear to the steam car advocates to place them on a level with the classes for petrol cars. It is regrettable that the weather experienced in the early weeks of the present year should have had the effect of retarding operations; but previously expressed good wishes for the success of the undertaking may be repeated with equal heartiness as the welcome already given the Brooklands Automobile Racing Club.

The Aero Section of Cordingley's Show.

APART from the interest which is being awakened in the Motor Car Exhibition at the Agricultural Hall next month, much recognition will be given by the public to the section which is being arranged by the Aero Club. In discussing this exhibition Prof. Huntingdon has remarked to a Press representative that it will do much to stimulate the inventive faculty and advance the movement in this country. The prizes amount to £250. Mr. H. E. Perrin, the secretary, says that between twenty-five and thirty model flying machines have already been entered for the Exhibition. The list of entries closes to-day (Saturday), and by that time it is quite possible there may be twice the number already mentioned. The prizes of £150, £75, and £25 offered in the competition by

the proprietors of the "Daily Mail" have, indeed, aroused very widespread interest, and America, France and Belgium will be represented at the exhibition as well as Great Britain and Ireland. An interesting feature of the competition is the encouragement it has afforded to amateurs and mechanics, amongst the intending exhibitors being men in humble circumstances. The exhibition will give to all who have ideas a chance of bringing them out and showing what can be done. There is very little that can be patented in a flying machine, so that there is little use in a man saying "I'm not going to let anyone see what I have done, but am going to keep it secret." Excellent results may be anticipated from bringing together the men with ideas, and letting each see what the other has done.

Motor-car Imports and Exports.

ALTHOUGH, as compared with the first month of the year, there was an increased importation of foreign motor-car productions into Great Britain during February, the returns show a falling off from the high total recorded in the same month a year ago. The number of vehicles which reached this country during February is returned at 445, their value being given as £197,390. Parts were responsible for an additional £182,876, which gives a total of £380,266, as against £396,422 in the corresponding month of last year, and £252,751 in February, 1905. Turning to the exports of British motor-cars and parts, these, on the other hand, continue to exhibit a very satisfactory increase. The number of cars shipped in February was 155, of a value of £58,692, while parts accounted for a further £43,167, the total of £101,859 contrasting with only £39,331 in the corresponding month of 1906.

The Motor Union Car Badge.

THE Motor Union has decided to issue a badge for attachment to motor-cars as the distinguishing mark of its members. The object of the Motor Union badge is to discourage inconsiderate and reckless driving, and at the same time to protect those carrying it from vexatious prosecutions. It is made of metal, and when fastened to the car dashboard or other convenient place will enable a member of the Motor Union to be readily identified upon the road. It will thus serve also to maintain and increase that excellent *esprit de corps* which has played such an important part in the growth and development of automobilism. The Union attaches great importance to the badge being everywhere recognised as the sign of the considerate driver, so much so that the Union reserves the right of securing its return in the event of any driver using it being found guilty of reckless driving or neglect of the amenities of the road.

The Police and Licences.

ANOTHER instance of the police over-reaching themselves has occurred at Epsom, where a motorist, summoned for not producing his licence when requested to by a constable, has had the satisfaction of demonstrating a piece of illegality. The effect of this should be to prevent similar high-handed

B

practice within the area of the jurisdiction of that court and elsewhere. Mr. Staplee Firth said the licence had been produced, but the motorist had declined to allow its examination by the policeman. The latter asserted in court that he had written instructions from Captain Sant, the Chief Constable of the county, to examine the backs of all licences—an entirely unauthorised procedure never contemplated by the Motor Car Act, and entirely alien to the ordinary methods of justice in this country. Prisoners when in court are never confronted with a record of past convictions until their trial is complete. But here in the case of motorists the police apparently seek to obtain a record of previous alleged offences before even the decision to issue a summons is taken. This is decidedly un-English, and we were glad to see that Mr. Firth was not only able to secure the dismissal of his client at Epsom, but also an expression from the chairman of the Bench, Sir William Vincent, to the effect that the police had no right to attempt to see any endorsements that might happen to be on the back of the licence. Motorists upon whom a similar demand is made elsewhere should make a note of this case, and decline to do more than exhibit their licence to officious policemen.

The above illustration shows the Representative of the Daimler Company, Mr. Percy Warren, of Brighton, seated in his car with H.H. Prince Mahmoud Hundi Pasha, son of the late Khedive Ismail Pasha. In the background is the entrance to the Ghazirah Palace, which was built by the late Khedive Ismail Pasha, and is one of the finest palaces in Egypt.

Sheffield Welcomes the Car.

PROVINCIAL motor-car exhibitions give opportunities for the men of light and leading in the various localities to lend their voices to the general chorus of automobile appreciation that is ever strengthening. At Sheffield the other day Alderman Robert Styring, the Lord Mayor, gave the usual eulogy of the motor-car and mentioned that the Corporation spent £1,500 per week in keeping the roads in repair. Having regard to the fact that the rubber tyres of cars wore the road to a very small degree as compared to the iron tyres of other vehicles, he pointed out that the rubber-tyred vehicles would be an economy to the local authorities. Certainly the Sheffield Corporation welcomed the automobile and would be glad to see the works that had been established in the city for the production of cars eminently successful. They were also proposing to augment the tramway service by introducing motor-cars into outlying districts, where the traffic was hardly likely to be sufficient to warrant the laying of tracks and all the expense incidental to the tramway system.

Tram Standards.

AT the special meeting of the Nottinghamshire A.C. Mr. Charles Hardy made an announcement of more than local concern. He said that the tram standards now in the centre of the streets of the town are to be moved to the sides, a start to be made on the Derby road ere long. Around the metropolis these unsightly and dangerous obstructions in the centre of the roadway are irritatingly familiar to motorists, who have often united their voices against the way in which local authorities have allowed their erection. Unfortunately, however, this has generally been to little purpose; hence the interest that will be felt in the announcement that comes from Nottingham, which, we understand, is in the nature of an experiment. The point is also of value in giving new demonstration of the value of a virile organisation looking after the interests of motorists in every district of the country. The club in the lace centre has always been energetic and watchful; and, incidentally, we hope its unity will in no way be affected by the incident mentioned at the special meeting last week, in which the old question of the association of trade members in club life was partially revived, as will be seen from our report on another page.

Restrictions of Business.

SOME amusement is being caused in the trade by a notice which is to be found in one or two showrooms to the effect that purchasers of motor-cars therein must not show their vehicles at any exhibition within a score of miles from Charing Cross, without the seller's express authority in writing. This is somewhat absurd, for it cannot be expected that the buyer of a vehicle will promise to forego any pleasure he may have in his purchase at the bidding of the seller. If he wishes to exhibit his car to friends in any show, he will do so; if he wants to run the vehicle on Handcross Hill, he will do so; if he makes up his mind to re-sell the vehicle, he will do so. The car is his—to run, show, or to smash-up, if he is foolish enough to perform the latter operation. Such attempted restrictions are frivolous and useless; and motorists only smile when they see them in print.

The Emission of Vapour.

IN all probability, though it is not finally settled, the Vapour Emission competition of the Automobile Club will be held on Tuesday next. This trial has been inaugurated with the object of encouraging the improvement of the design of existing petrol-driven motor-cars, in order to diminish the nuisance caused by foul exhaust. The trouble generally arises from two causes: Firstly, from an improper mixture, giving an excess of poisonous carbonic oxide in the exhaust gases; secondly, from excessive lubrication, causing an emission of blue smoke, due to the lubricant finding its way into the upper parts of the cylinders. The competition will be divided into two parts—a road test, consisting of a run of about 150 miles, and an incline test. The judges will observe the cars, causing the same programme to be carried out by each competitor, and will note the results. It may be necessary for them to order cars to be over-lubricated or worked with improper mixture, in order that they may judge of the effectiveness of the means employed to correct these errors. In the incline test the cars will be tested standing on an incline of about 1 in 7 in each direction for ten minutes, with the engine running at normal speed. A half-inch cock must be fitted into some part of the silencer or pipes leading thereto, for the purpose of coupling a gas analysis apparatus. The following points will be taken into consideration in making the awards, namely:—(a) The car which, independently of the skill or care of its driver, gives an exhaust least offensive to the public using the road; (b) the car best constructed to enable the driver, by reasonable care, to obtain continuously an inoffensive exhaust; (c) the best system or device to enable the driver to observe continuously

the nature of his exhaust (such as a small by-pass to observe part of the exhaust, or a mirror to observe the whole). Devices which from their nature are always in action will be given the preference over those which depend on the attention of the driver.

Motor Boats.

LOOKING back over the last twelve years, and having in view the display of motor-boats in the Annexe to the Olympia Show, we would recall the first occasion that such craft were publicly exhibited in this country. It was at one of the earliest of the series of Cordingley Motor Shows at the Agricultural Hall, when a tank was devised in the gallery wherein motor-boats disported themselves, to the edification of the learned and the amusement of the crowd. The propelling power was electricity, and the occasion was useful in arresting the attention of the public to the possibilities of other forces than

matter to remain in much the same position as it was two years ago. At the same time, Mr. Tyrer is of the opinion that the use of alcohol must increase for motor purposes, and that the present difficulties are by no means insurmountable. He says that the Motor Union might do service by bringing influence to bear on the authorities, with a view to amendments and to getting alterations in the Spirits Act of 1880, which governs the manufacture of alcohol, and constitute, in his opinion, at the present moment one of the hindrances to the production of cheaper alcohol. He is sanguine that important changes in the future will take place. America, stimulated by what has been done in this country, has advanced in such a way that cannot fail eventually to influence our Excise authorities. Experiments on the use of alcohol for motors, without too great a regard to expense, would be one great factor in this direction—such as, for instance, experimental trials to determine the extent of corrosion of working parts and the composition of a suitable metal.

Mr. and Mrs. E. E. Whadcoat on their new 75-h.p. Six-Cylinder Mercedes. (See page 47.)

[Illingworth, Northampton.

steam. The automobile education of the public then begun has continued at a very rapid rate, and "We are all motorists now" might be an adaptation of the late Sir William Harcourt's favourite phrase on the part of those who take their pleasures on the water—at least in theory, although the idea has not been realised in fact.

Alcohol for Motors.

AMONG the witnesses before the Fuels Committee of the Motor Union has been Mr. Thomas Tyrer, who was one of the signatories of the report of the Departmental Committee on Industrial Alcohol issued in 1905. Since then, he believes, it is possible that the use of alcohol has increased for agricultural motors and for military wagons; but the high price of the spirit and the fact that a different carburettor is required in using alcohol than is the case with petrol, have caused the

Commercial Vehicles for Pleasure.

IN some way, though not in the excitement it created, the Commercial Vehicle meet which was held on the Thames Embankment on Sunday recalled an other assemblage at one of the early Cordingley Motor Shows, when motor-vehicles of all degrees were driven to Hounslow, to demonstrate that the cars then shown at the Agricultural Hall were capable of progression in traffic. Some of the makers of vehicles shown at Olympia enjoyed a run from the Thames Embankment to Ripley on Sunday. The start was made shortly after 11 a.m., the F.I.A.T. 40-h.p. omnibus taking the lead, followed by a Maudslay 'bus, a Darracq-Serpollet 'bus, a 28-h.p. Straker-Squire B.T.H. petrol-electric 'bus, a 40-h.p. Ryknield 'bus, a Dennis van, and a four-ton "Commercial Cars" van. Argylls, Ltd., made a brave array with a 16-20-h.p. two-ton covered van, a 10-12-h.p. light-delivery van, and the 14-16-h.p. motor-cab.

The Adams 10-h.p. delivery van and the 30-h.p. four-ton Berna lorry were the whippers-in to the procession. The passengers on the top of the high 'buses had rather anxious moments at times, having to dodge branches of trees overhanging the roads. After lunch the return journey was made, and, taken as a whole, the trip was very successful.

Touring Difficulties on the Continent.

WHEN contemplating a tour in France there are several small points that should be remembered. Owing to the French rule of the road to keep to the right, the tail lamp should be carried on the left instead of on the right, as in England. It is difficult to obtain a ready-made tail lamp and bracket for this position in England, and it is a frequent complaint that the engine appears to lose power in France without any apparent cause. This may often be traced to the brand of petrol used. Some makes are much denser than any used in this country, and do not, therefore, suit an English carburettor. Before taking the latter entirely to pieces, therefore, the weekly report of the Royal Automobile Club advises motorists to try changing the brand of petrol. A club member recently reported a most discouraging experience in this connection. The car had been running perfectly in England, but on arrival in France it seemed to be immediately afflicted with galloping consumption; no speed could be got out of it. The unfortunate driver spent half of each night in adjusting everything visible, but it grew weaker and weaker after each operation. At last another brand of spirit was tried; the patient recovered immediately, and since then they have tried no others.

The Action of a Magneto.

MR. W. HIBBERT, A.M.I.C.E., has been discoursing before the members of the Automobile Club on some points in the action of a magneto. Referring to recent experimental investigations with regard to the battery and coil, he said they proved that higher voltage needs less advance. It probably means hotter sparks, but there is nothing to show that the heat of the spark has any appreciable effect on the rapidity with which the explosion is propagated. It is to be remembered that the significance of higher voltage lies in the fact that the current grows more quickly towards its final value. Consequently, reckoning from the moment at which the commutator completes the circuit, the current reaches the necessary exciting value earlier when urged by 6 volts instead of 4, and the spark occurs a trifle sooner. The data available for the magneto form of ignition is very meagre. Mr. Hibbert's own measurements on a low-tension magneto of the "Castle" type are of interest, although they were only relative. But from the arrangements made and the current delivered the mean value of the pressure must have been about seven volts, and from this, together with other facts, some useful deductions may be drawn. The maximum voltage is much higher than seven, and, therefore, gives a large margin of reduction before it becomes useless for the purpose of exciting the coil employed with it. This means that if the contact is broken at about the maximum position it will need very little advance. Again, if we suppose that the voltage would serve even if it fell to half the maximum value, it is available not merely at a particular moment, but for a period comparable with one-quarter of the half revolution. Or, if one-third the maximum voltage will suffice, it is available for about one-half the time of a half revolution. We trust Mr. Hibbert will continue his investigations until we have as much reliable data for this form of ignition as for the battery system.

THE Motor Union is taking steps to secure the amendment of Section 33 of the Offences Against the Person Act, 1861, so as to enable magistrates to order boys between the ages of seven and thirteen found guilty of stone throwing upon the highway to be birched.

THE ROVER DEPOT.

NOTABLE for location and with ample facilities for dealing with an expanding business, the new depot of the Rover Company in London constitutes a worthy addition to the long list of showrooms devoted to motor-cars. In fact, the premises in New Oxford Street, at the corner of Shaftesbury Avenue, enable a window display that is exceptionally well proportioned to the area of the building. On three sides of the depot cars can be shown to the public, and on the three floors between forty and fifty vehicles, from the little 6-h.p. car with its hood, for professional men, to the 16-20-h.p. vehicle can be exhibited, while the provision for storing parts is equally good. Here intending motorists can not only inspect cars that are ready to be driven away to their own houses, but they can examine models and actual parts of the mechanism. The fact that it is intended to keep at Albion House—the name of the new depot—a stock of vehicles for immediate delivery is a matter of some importance, and Mr. F. J. Jenkins, the London manager, whose supervision will ensure success to the new venture, hopes for a spell of seasonable weather to bring along those customers who have already ordered cars that are now awaiting delivery in the show rooms. A repair department and garage has also been established in Theobalds Road, N., equipped with a complete plant and manned by mechanics from Coventry. In connection with the opening of the depot pressmen foregathered on Monday, when Sir F. Dixon Hartland, the chairman of the Rover Company, paid a tribute to the work that has been done by Mr. Harry Smith, the managing director, who, in the course of his speech, declared that the policy of the future would be, as in the past, to supply cars for the multitude at prices that were within the reach of people who had not previously been regarded as carriage folk—a policy that finds expression in the vehicles now to be seen in New Oxford Street. The depot is near the British Museum, Mudie's Library and the well-known motor depots of Shaftesbury Avenue.

THE last report from the Automobile Club was to the effect that there were three devices left in the Side-slip Competition, those of Mr. G. B. Winter, Mr. H. B. Molesworth, and the Hartridge Tyre Syndicate, Ltd.

REPLYING to a questioner in the House of Commons, Mr. Gladstone, the Home Secretary, has naively stated that "the number of deaths registered in 1906 as having been caused by motor-cars could not be stated until several months had elapsed."

THE International Tourist Trophy Race for auto-cycles is to be held in the Isle of Man one day during the week ending June 1st. The first entries received are two Triumph motor-bicycles by Mr. M. J. Schulte, and two Matchless motor-bicycles by Mr. H. A. Collier.

ON visiting the works of the Birmingham Aluminium Castings Company a few days ago, we were much struck with the rapid development which has taken place in this branch of trade during the past two years. Although additional workshops and furnaces have been made, and a heavy stock of aluminium carried, it is almost impossible to keep pace with the demand for aluminium goods.

MR. H. J. CLIFFORD, of Elm Road, Wisbech, has sent us a copy of a useful little card he has just published. It is entitled "H.P. at a Glance," and gives in tabular form the horse-power of motors of from one to six cylinders and of cylinder diameter ranging from 2½ in. to 6 in. (advancing by ½ in.) as based on the A.C. rating of diameter of cylinder squared × No. of cylinders ÷ 2.5.

A MOTORIST who has had evidence of the good work of the Middlesex Motor Carriage Company, Ltd., of Cricklewood, N.W., writes to say that their new garage will be at Avenue Close, and that the works will be well equipped for all classes of repairs. Accommodation for men as well as cars is provided and the establishment has the reputation of being thoroughly up to date.

AUTOMOBILISM IN CEYLON.

MOTORING in Ceylon has made great progress during the past few years. At first some doubt was expressed as to whether difficulties due to the tropical climate would ever permit of the motor-car becoming a popular vehicle; but these were not found so serious as had been feared, and a little experience soon overcame them. The advent of the automobile in Ceylon synchronized with the commencement of the rubber boom. The number of cars which have reached Ceylon during recent years is very large in proportion to the European and well-to-do native population. At present the chief purchasers are the British planters, brokers and other commercial men in Colombo, the capital and chief city, but the wealthiest natives are also beginning to succumb to the fascination of motoring, and in the future they will probably offer a good field for firms wishing to extend their business, especially as, equally with the Europeans, they are sharing in the benefits of the increasing trade of the island.

Side by side with the enhanced commercial prospects of Ceylon its reputation as a tourist resort has been rapidly growing. This also has given an impetus to automobilism. Some time ago a company was formed for the purpose of

some parts of the year, and a good deal of care is required in looking after the mechanism.

One of the chief uses of a motor-car in Ceylon is to facilitate visits to high elevations from the enervating plains. Some of the hills are ten or twelve miles long, but they can be negotiated on the second speed, which means ten to twelve miles an hour. The highest hill station, Newara Ellya, has an elevation of only 6,000 feet, and the shade temperature in the day time is about 80 degrees Fahr. This is comparatively cool, and proportionately delightful to the tropical resident, but the drop in temperature is not so great as to affect the motor to any appreciable extent.

Commercial automobilism is as yet in a very youthful stage. There are a few steam motor lorries in the island, but experiments that have hitherto been carried out for developing a motor carrying trade, in which motors should take the place of carts and bullock wagons for the conveyance of produce in districts which are not reached by the railways, have not met with much success. The Government has decided to establish a motor-car service between Bandarawella, the terminus of one of its railway lines, and another centre about fifty miles away. If it proves successful similar services will undoubtedly be started in other parts of the country. The roads are on the whole good,

Ready to start from Soerabaija.

A Primitive Bridge at Preanger.

MOTORING IN JAVA.

hiring motor-cars to the large number of passengers that arrive almost daily on their way to and from the Far East, Australia and Europe. Most of the steamers stop a day and sometimes two days in port, and passengers were thus enabled to take motor trips to some of the most interesting spots in the island. This undertaking, however, proved a failure, it being found that the charge of a rupee a mile was not a remunerative one and that people were not willing to pay more. The cars at present in use in the island have invariably been imported from England, and are of English, Continental and American construction. The chief makes are the Wolseley, Rover, Gladiator, Albion, Argyll, De Dion, Fiat, Beaufort, Clement-Talbot, Humber, Star and Oldsmobile. The greatest demand is for two-seated cars with vertical engine in front, which gives plenty of room for luggage. This sort of vehicle is found most useful by planters, who use them both for pleasure and business. Among family cars the most popular are the four-seated side-entrance phaeton, again with vertical engine in front, and in future there will probably be demand for nothing less than four-cylinder engines. In a tropical country, naturally Cape cart hoods are a *sine qua non*, being required as much as a protection against the sudden and heavy downpours of rain as against the strong sun. Curiously enough, an attempt to ingratiate canopy tops with motorists failed. The climate is very moist, in addition to being hot, during

though dusty during the dry season, and increasing attention is being paid to them by the Government, which maintains all public highways. The old-fashioned toll system which used to be in vogue in England is still in existence, but there is an ordinance at present before the Legislative Council for abolishing it. It is proposed to make up the loss in revenue by an increased tax on motor-cars and vehicles of all kinds. It is, however, doubtful whether the ordinance as it stands will go through, as there is a great deal of opposition to it. The tolls are vexatious to motorists, necessitating frequent stops on the road, and their abolition would be greatly welcomed.

There are no repairing facilities except in a few of the towns situated widely apart, and travellers have to chance a breakdown. The pleasures of motoring in Ceylon are, however, so great that most people accept the risk without hesitation. There is probably no country in the world that offers greater attraction to the motorist. The tourist motoring through the low country, gliding past picturesque jungle and palm forest, and along the banks of bamboo-fringed rivers, has not had time to weary of the gleaming kaleidoscope of tropical colour before he finds himself in the rugged hill country and in the midst of mountain scenery rivalling that of Switzerland in grandeur. Besides, he obtains a glimpse of Oriental life that is most interesting to a European.

SOME FACTS ABOUT LEATHER-FACED CLUTCHES.

A FAIR number of cars are still turned out with leather-faced cone clutches, so it may be concluded that this form of transmitting power from the engine to the gear-box has its advantages and is still popular. The majority consist of a female drum—the fly wheel—which is hollowed out to receive the coned leather-faced male portion. The flywheel is keyed to the end of the crank shaft and the male part, by some form of coupling, to the first motion shaft of the gear-box. The two portions are kept in close contact by a powerful spring—in some cases by more than one—and a lever worked by a pedal allows of their separation.

In some the male member recedes from the female, in others the female from the male, and in one variety the male disengages by pushing forwards in lieu of being pulled back. Still the principle is identical. Provided the cone is of sufficient length and suitably tapered so as to permit a gradual engagement, and the springs keeping the two in contact are capable of adjustment, so that if they become weak they can be tightened, then this method has certainly the advantage of simplicity and ease of adjustment. The troubles

The "Free Farms for Willing Workers" travelling demonstration van, built by the Darracq-Serpellet Co. for the Emigration Department of the Canadian Government.

that may occur are, like most automobile worries, nearly always preventible, and certainly capable of roadside repair. Roughly, two conditions of anxiety may present themselves.

The clutch is too fierce. This is known by the car jerking forward when the clutch is let in. The danger of this is that it throws an excessive and needless strain on the transmission gear, and as a result the shafts in the gear-box may bend or fracture, bevel pinions strip, or the differential sleeve break. A fierce clutch causing jumping of the car on starting may be excellent for the passenger's liver, but is certainly improper treatment for the car's transmission gear. The application to the leather of a little castor oil or patent dressing will, as a rule, avoid this complication. Occasionally the leather gets rucked up slightly—that is, the cone is no longer a true fit. Removing the male portion and turning the same in the lathe is the remedy. Care is required in doing this, and but a shade should be removed, say a sixty-fourth. Before replacing a dressing of equal parts of paraffin and castor oil should be applied and allowed to dry in. This certainly prolongs the life of the leather.

Should the leather be worn so that the screws or rivets fixing it to the cone project, a new leather is required. Any saddler will supply the required material—cod oil dressed harness leather; that cut from the thickest part of the butt is the most suitable. It should be from four to five sixteenths of an inch thick,

and, what is most important, of the same thickness throughout—that is, in its entire length. It is best put on in segments and the ends butted and scarfed. The leather should be well stretched prior to attachment. The screws or rivets used must be well countersunk so that they do not project even after considerable wear, and to prevent the possibility of these working loose it is as well to rivet the end projecting on the inner side of the cone; if at some future time the leather has to be taken off, a small chisel will speedily remove the burr. After it is fixed it should be spun in the lathe so that it is absolutely true. Prior to use castor oil should be applied. A good method to ensure sweetness of engagement is to file three recesses in the circumference of the cone three-quarters of an inch long and an eighth of an inch deep, the gaps being arranged equally distant from one another. A piece of watchspring should be slipped into each cleft before the leather is attached. These cause a slight bulging, which is gradually overcome as the clutch engages, and so a more gradual engagement results. Since adopting this idea on my two-cylinder Star car I have driven it almost daily for two and a half years without any clutch trouble, and it is now sweet and minus slip. I can but conclude my remarks on fierce clutches with this aphorism, "Use castor oil for the clutch, and thus avoid repairers' bills."

The Clutch Slips.—If this should occur when one is showing the car off on a hill, provided there is a spring and it is down, or the brakes are in working order, little harm results beyond injury to one's pride, otherwise there will be a surgeon's as well as a repairer's bill. Keeping the leather free of lubricant, or, if it is greasy, dusting on a little Fuller's earth, will generally prevent these torts, which are by far the reverse of pleasant. Slipping, in addition to an oily face, may be due to the clutch spring becoming too weak. Most cars are now constructed so that the tension of the spring can be adjusted, otherwise it must be taken off and backed up with washers. It is as well, too, to carry a spare spring in case of breakage. As a result of a neglected slipping clutch the leather may become charred and then stick, so that it is no longer possible to disconnect the engine from the part it drives, which is inconvenient in traffic, as, if one once comes to a stop by switching off the electricity, unless on a hill, the car only becomes restarted by the aid of a few pushers from behind. Soaking with paraffin will facilitate the separation of the parts; occasionally, however, their disconnection will entail the taking down of the whole flywheel. I have a vivid remembrance of being held up outside Ipswich with a stuck-in clutch, which was only ultimately released by taking down and driving in a wedge between the parts. The early treatment of the slipping clutch would have obviated all the trouble. Possibly in the near future there will be a Society for Prevention of Cruelty to Automobiles, and they, without doubt, will have inspectors to see that all diseased clutches receive early and prompt medicine. Truly in all slight as well as gross motor complaints a stitch in time saves nine.

CHARLES T. W. HIRSCH.

LADY MONTAGU OF BEAULIEU, in her interesting Motoring Causerie in "The Throne," refers with evident approval to our recent Comments on the wisdom of settling motor disputes by arbitration through the good services of the Motor Union rather than by the expensive methods of the Law Courts.

MESSRS. S. SMITH AND SON, LIMITED, have brought out a new taximeter, which has been specially constructed to meet the requirements of the London motor-cab. On the dial on the left of the apparatus time is shown by the hour, and on the other dial the distance traversed in miles. Neither of these dials can work together, when one is in action the other must be stationary. Thus, when the distance traversed is between two and three miles and the "fare" gets out, the cabman has only to press a lever and the time he is kept waiting will be recorded. On starting he will re-press his lever and it will continue to record the distance traversed. Therefore, at the end of the journey, there will be a record showing exactly the number of miles traversed and the time kept waiting.

SOME CURRENT TOPICS.

Valve Operation—One or Two Cam Shafts.

Continuing our review of the interesting statistical return prepared by M. Lucien Perissé, in connection with the last Paris Salon, we come to the method of operating the valves of petrol motors. He confirms the view that there is a tendency to adopt a single cam shaft—that is, with the valves arranged on one side of the cylinders—by showing that the motors so constructed have advanced from 28 to 39 per cent. Those with the valves located on opposite sides, and operated off separate cam shafts, although the percentage has been reduced, are, however, still largely in the majority, representing 55 per cent. of the total, as against 64 per cent. a year ago. The balance of 6 per cent. have the valves in the cylinder heads. In connection with the interesting question as to whether governors are necessary, M. Perrissé shows that only about 33 per cent. of engines are now fitted therewith.

will no doubt be of interest. One expert, who is responsible for the design and construction of a well-known car, writes:—"I do not pose as being a leader or attempting to lead the public ideas in this matter. As regards my own personal opinion, however, I distinctly disavow adding any feature to a car that can reasonably be done without. One sweeps away a lot of complications by not connecting either brake to the clutch, but of course our French friends are unable to do this except in the case of cars they export to England, as the authorities in France insist that when the brake is on the engine shall be disconnected. On my own private car I would never think of having such a thing as a speed indicator, simply because one always has a speed indicator on the vehicle in the form of the manometer, and it is quite easy to know what the car is doing from the needle on this device."

An Advocate of Simplicity.

The designer of another very popular British car writes with reference to the article on "Are Cars Too Complicated?" in the *M.C.J.* of the 2nd inst.:—"I will say right away that, whatever anybody else's opinion on the subject may be, I know they are. I heartily endorse what M. Baudry de Saunier says, and I am of opinion that he has not exaggerated at all; quite the contrary, he

At the Casino at Nice. On the Road to Avignon.
THE TOUR OF FRANCE BY A HOTCHKISS SIX-CYLINDER CAR.

Water Cooling Systems.

Passing to the matter of water circulation, the statistics show that the thermo-siphon system has slightly advanced in favour, being now found on 14 per cent. of the cars, as against only 12 per cent. a year ago, engines with pump circulation having declined from 88 per cent. to 86 per cent., the position being thus the same as at the end of 1904. By far the majority of pumps are now gear driven, only 1 per cent. being operated by friction off the flywheel and 5 per cent. by a spring drive. As regards the battle of the radiators, the *nid d'abeilles* or honeycomb variety appears to be rapidly losing its popularity, the proportion being now only 40 per cent. as against 59 per cent. at the 1905 Salon, the ribbed tube variety having increased from 41 per cent. to 60 per cent. All but 7 per cent. of the cars are now fitted with a fan to draw a current of air through the radiator, the proportion of fans being 63 per cent. behind the radiator, 15 per cent. flywheel fans, and 15 per cent. both systems combined.

Are Cars too Complicated.

Our recent remarks on this subject appear to have attracted considerable notice, for not only have we received communications on the matter from a number of motorists, but also from several well-known British motor experts. Unfortunately, we cannot publish their letters in full, but the following extract

has not been strong enough in his comments. Those who have been making motor-cars for many years know quite well that, in point of efficiency, the car of to-day, with its complicated parts, is very little in advance of the plain machines that were made years ago. I have always tried, as far as possible, to build cars with as few component parts as possible, and that these components should be easily get-at-able and also easily dismantled without removing others. I am not at all of opinion that the internals of engines, or the gear-box or back axle either, want to be accessible, except to be able to put the necessary lubricant into same, but consider that these parts themselves, engines, gear-boxes, back axles, carburettors, pumps, &c., should be of the simplest construction. I am sure that in complicated cars the resulting efficiency is hardly appreciable over the simple vehicle. While I admit that these beautiful complicated pieces of machinery are great improvements on what was made years ago in the point of mechanical contrivances, still I am certain that their utility has not been enhanced to any great extent by their complexity, certainly in no way in proportion to the extra expense and liability of derangement. My opinion is that the motor-car of the future, the commercial car, the car that will be handled by the masses, will be a very simple one and, practically speaking, fool proof. Briefly, my ideas on the subject are that it is a great mistake to sacrifice simplicity to a very small percentage of extra efficiency.

CONTINENTAL NOTES.

Motor Vehicles in the German Army.

An important addition to the German Army Transport Department is about to be made by the creation of a regular automobile section, the first duties of which will be to test the efficiency and safety of motor vehicles as a means of transport under actual war conditions, and, further, to train a special body of men, to be known as the Automobile Corps.

The Late M. Hospitalier.

France has so far this year suffered heavily by the death of prominent scientists and engineers. The death of M. Leon Serpollet was followed by that of M. Moissan, to whose labours was largely due the great development in acetylene lighting, while now we have to record the death of M. Edouard Hospitalier, the vice-president of the Technical Committee of the French Automobile Club, at the early age of fifty-five years.

metres on his 20-24-h.p. Clement-Bayard; Liegard being second, with 7.66 kilometres to the credit of his 18-h.p. Peugeot.

The Kaiser's Cup Race.

The ballot for the order of starting in the race for the Kaiser's cup, which is to be held on the Taunus course in June next, has resulted in the first place being taken by a Durkopp; an English Daimler is twenty-ninth, and a Napier thirty-ninth. It has been decided that the cars of the different nations shall be painted in distinctive colours, Germany being white, England green, Austria black and yellow, Belgium yellow, France blue, Italy red, and Switzerland red and yellow.

Public Services in Germany.

A company has been formed at Wolfach (Baden) to start a public motor-car service between that town and Rippoldsau. Arrangements are also in hand to inaugurate a service between Freudenstadt and Achern, Wurtemberg.

Touring in Sicily.—The main street of Caltavuturo, one of the little towns on the Targa Florio Circuit.

A German Light Car Trial.

The German Motor-cyclists' Union is organising a reliability trial for light cars for the 6th, 7th and 8th May next. The competing vehicles will be divided into three classes as follows:—(1) Vehicles costing up to £150; (2) ditto from £150 to £225; and (3) ditto from £225 to £300. The first day's run will be from Dresden to Berlin, the second from Berlin to Kiel, and the third from Kiel to Hanover.

The Cannes Automobile Meeting.

The automobile meeting at Cannes commenced on the 6th inst. with a hill-climbing competition. M. Quinson, on a 22-h.p. Berliet, took the first place. A flying kilometre speed trial was held on the 7th inst., when Heurtard, on a 25-h.p. Gobron, made the best time, 55 sec.; Gallice, on a 24-h.p. Clement-Bayard, being second in 1 min. 2 sec. Saturday last was devoted to a consumption test, each competitor being served with a litre of spirit. Durand ran the farthest distance, covering 9.7 kilo-

Miscellaneous Items.

A series of kilometre and five kilometre speed contests are to be held at Verona, Italy, on the 19th instant.—A military motor-testing track is about to be established on Government land near the huge drill ground at Tempelhof, Berlin.—A motor-car exhibition is to be held in Copenhagen from September 28th to October 7th next.—The exports of motor-cars and parts from France during January last amounted to only £363,360, a decrease of about 16 per cent. as compared with the corresponding month of 1906.—It is proposed to organise an automobile relay race in May next from Vienna to Kiel, with the view of conveying a letter between the two places in record time.—It is stated that the Sporting Commission of the A.C.F. has decided to hold the Grand Prix and Commission Sportive races on one day, the competitors in the former being started at 6 a.m., and in the latter at 9 a.m.—During the past week M. van Marcke, on the six-cylinder Hotchkiss car, has continued his tour of France, visiting Agen, Bordeaux, Perigueux and Brive, the last two days' running having been made in bad weather. Altogether the car has so far covered about 2,300 miles.

THE Tourist Trophy motor-cycle race will probably be run on the early morning of one of the days of the first week in June next.

THE borough of Smethwick will be constituted a county borough on the 1st prox., and has been assigned the letters HA as the Index Mark in connection with the registration of motor-cars.

MESSRS. R. SEYMOUR AND SON, whose garage is on the main road at Sale, in Cheshire, have excellent facilities for the repair of vehicles.

VISITORS to the Isle of Man will find a new garage conveniently situated in Athol Street, Douglas, where Mr. W. J. Lewin will be able to accommodate eight or nine cars.

ACCORDING to Mr. F. Street, of Somersham, who has been lecturing on the "Breeding of Heavy Horses at Colchester," there never was a greater demand for big weighty geldings than at present.

THE first annual chauffeurs' dinner has just taken place at the Three Tuns Hotel, Melton Mowbray, Mr. W. Pearce presiding, and Mr. T. Gowan occupying the vice-chair. There were upwards of forty chauffeurs present.

A MOST interesting Yeomanry staff tour was carried out from the 20th to the 23rd February, in the Southern Command, under the direction of Brigadier-General Bethune, in which ten officers of the Army Motor Reserve took part.

MESSRS. CROOKSHANKS AND COMPANY have opened the Blenheim Motor and Engineering Works at 146, Brixton Hill, London, S.W., as an up-to-date garage. Repairs to cars will be undertaken and business done in the sale of second-hand vehicles.

THE second annual motor-car exhibition held under the patronage of the Sheffield Automobile Club was opened in the Artillery Drill Hall, Sheffield, on the 8th inst. Altogether there are about eighty stands, on which are to be seen examples of the principal British and Continental cars. The show closes to-day (Saturday).

THERE is a pathos in the unpunctuality of some of the cars that have appeared too late at the enclosure in the Tourist Trophy race, and the Rev. J. M. Spicer, a Manxland minister, has been drawing some moral lessons from the unreadiness of their drivers—a new use for the A.C.G.B.I. competition in furnishing texts for ministerial observers of automobilism.

THE business of Messrs. Sawyer and Co. and that of the Paddington Motor Company, Ltd., will in future be conducted under the name of the Motor Stores, at 315, Euston Road, N.W. The well-known Sawyer non-skid band will still be manufactured at the company's works in Banister Road, Kensal Rise, W., under the personal supervision of Mr. A. T. Sawyer.

MESSRS. J. P. HUXLEY AND COMPANY, of Whitchurch, Salop, send us a photograph of a shooting brake body they have recently built and fitted to a 40-h.p. chassis for Mr. J. D. Knoop, of Calverley Hall, Cheshire. The body, which was completed within seven days of the receipt of the order—a smart piece of work—is constructed of walnut, with turn-up seats, upholstered in pig-skin, and fitted with spring cushions.

ON page 41 of the present issue we reproduce a photograph of Mr. and Mrs. E. E. Whadcoat on their new Mercedes 75-h.p. six-cylinder car, which was delivered to them on Saturday last by Mr. Victor Ashby, of the Motor Works, Towcester, after having been fitted with a body by Messrs. Salmon and Sons, of Newport Pagnell, in the remarkable time of three days. Mr. Ashby, who is seen in the back of the car at the side of the chauffeur, writes:—"I believe the car to be actually the first completed one of the type in this country, as I understand the Duke of Westminster's vehicle to be yet in the coachbuilder's hands. I may say the running of the car is most beautiful; when it arrived in this country I filled up with petrol, and one pull of a quarter turn at the starting handle set it purring silently."

HERE AND THERE.

MESSRS. WELDEN AND BLERIOT, LTD., have a good selection of electric roof lamps for motor-cars at their depot, 53 and 54, Long Acre, W.C.

A CORRESPONDENT of the "Scotsman" says that thirty years ago a steam propelled omnibus stood in the Industrial Museum in Chambers Street, Edinburgh, and asks "Where is it now?"

AT 4, Hans Road, Brompton Road, S.W., motor showrooms have been opened by Messrs. Sadgrove and Co. Stocks of accessories will also be maintained.

THE alleged excessive speed of the motor fire engine belonging to the town of Wellington, N.Z., when going to a fire, has been condemned by the local coroner.

AN examination in connection with the A.C.G.B.I.'s scheme was held at Plymouth on the 12th inst. Others will take place at Nottingham on the 20th prox., and at Bristol on May 4th.

THE organisers of the motor-boat exhibition which is to be held in Kiel, Germany, from the 15th to the 30th June next have issued an illustrated guide to the town, which, as it is printed in English, should prove useful to intending visitors from this country.

The 24-h.p. Albion Car recently completed for Mr. J. F. Henderson, one of the Managing Directors of the Albion Motor Car Co., Ltd.

ORDNANCE Survey maps of Bristol and also of Monmouth, each on a scale of two miles to one inch, have been published by Mr. T. Fisher Unwin. The features of these maps are well known to motorists, and those for the districts named will be of interest to all in the West of England.

FROM Messrs. Dunod and Pinat, 49, Quai des Grands Augustins, Paris, comes a copy of the book entitled "Le Breviary du Chauffeur," by Dr. Bommier. As may be gathered from the title, the work is intended as a sort of guide to the mechanical portions of motor-cars, the arrangement adopted being such that in a series of chapters the main components of automobiles are not only clearly described but their functions and the derangements to which they are subject are explained. In this way the chassis or frame, axles, springs, tyres, the engine and its necessary adjuncts in the way of ignition apparatus, carburettor, water circulation, transmission, brakes, &c., are all carefully gone into, a large number of illustrations amplifying and elucidating the text. The book is written in as far as possible in non-technical language, and although it is, of course, in French, should prove of interest to many English motorists and motor-car drivers. The popularity of the work in France is evidenced by the fact that although the first edition only made its appearance eight months ago, a second one has already become necessary.

THERE are said to be 800 motor-cars in Bradford.

THE Countess of Ravensworth has recently acquired an Itala car with laudaulet body.

A MOTOR-CAR is to be purchased for the service of the engineer to the Woolwich Borough Council.

LORD FARQUHAR has ordered a 60-h.p. six-cylinder Napier fitted with a limousine body from Messrs. S. F. Edge, Ltd.

THE Argyll car will not be in the Tourist Trophy race this year, as a result of the incident that occurred on the last occasion.

THE motor lorry of Messrs. J. M. Dent and Co., the publishers, conveying material to and from London and their works at the Garden City, is now a familiar object on the Hertfordshire main roads.

ONE of the latest novelties of the Michelin Tyre Company is a tyre inflator, in which the compression of two of the cylinders of a four-cylinder engine is employed, a two-way cock on the admission pipe being provided, by means of which the mixture supply to the two cylinders can be cut off and an air valve opened. The inflator comprises three small cylinders, two small and a central large one, in which are free to move corresponding pistons, all mounted on a common spindle. Each cylinder is connected with one side of the inflator by a branched pipe, one conveying the compressed air to one side of the large piston, and the other leading to a valve at the end of the small compression cylinder. As the air moves the large piston to the

right the smaller one sucks in a quantity through a valve, and on the return stroke compresses the same and delivers it to the tube connected with the tyre to be pumped up, at five times the original pressure. As one of the small pistons is compressing its charge the other is sucking in its supply of air ready for compression on the return stroke. By means of the device it is claimed that a 120 mm. can be fully inflated within five to six minutes, and this with no more trouble than turning the two-way cock on the admission pipe and connecting up the air delivery tube to the valve of the tyre. The inflator measures only about 5 in. by 2 in., so that it can be located near the engine in any suitable position.

A CONFERENCE has been held at New York between motor-car makers and representatives of the shipping concerns with reference to the transport of motor-cars. The latter declined to adopt a suggestion that crates should be dispensed with in conveying cars, although they agreed to reconsider the matter in cases where a score or so of vehicles were likely to be despatched together.

THE City Ignition Company, of 14, Spencer Street, Goswell Street, E.C., have issued a catalogue of their automobile accessories, which include the "Malcolm" high tension distributor and contact breaker, the "Cicoy" high-speed trembler coils and accumulators, the "Standard" and other types of sparking plugs, voltmeters, the "Dependence" tail lamps, and the garage safety lamp recently illustrated in our columns. A large selection of goggles is illustrated in the list, in which we also notice the well-known Rub-metal non-skids are given deserved mention.

LORD HOWARD DE WALDEN has recently ordered a six cylinder Siddeley car, fitted with a special limousine body.

SIR EDWARD CARSON, K.C., M.P., has placed an order with the Daimler Company for one of their 28-h.p. Milverton landaulets.

A COMPANY has just been formed in New York with a capital of £3,600,000 and the title the United States Industrial Alcohol Company, to manufacture denatured alcohol.

ELSEWHERE in the present issue we publish some interesting notes on motoring in Ceylon, taken from an article on the subject by Mr. T. Jones in the "Horseless Age."

THE magneto business of the Simms Manufacturing Company, Ltd., has been acquired by the Magnetos Simms-Bosch, Ltd., who will deal with orders from 33, Store Street, W.C.

MR. CHARLES SMITH, who recently resigned the secretaryship of the North London A.C., has entered the motor trade as a dealer and expert. He will open a depot at Hoppers Road, Winchmore Hill, N.

WE hear that the Royal Automobile Club will shortly enter into new premises, a change principally necessitated for the accommodation of the official staff, which is growing to large dimensions.

At the annual meeting of the Derby Chamber of Commerce it was mentioned that the coming of the motor had revolutionised the carriage trade and the local demand for bodies for cars had been successfully met.

WITH regard to the Lord Mayor's reference to the motor-bus at the opening of the exhibition now closing at Olympia, it may be remembered that one of the earliest services of such vehicles was organised by the Eastbourne Town Council.

LYNDHURST, the chief town of the New Forest, has an excellent motor garage and repair works, where Mr. J. Haynes, the proprietor, can accommodate about fifty vehicles and have repairs executed by skilled workpeople. He is also the district agent for the A.A.

THE Central Garage and Motor Company of Bath send us particulars of a new automatic carburettor for petrol motors, known as the G. and R., they have recently introduced. The idea of the inventors has been to produce a carburetting device which shall give a constant mixture at all engine speeds and loads without employing any delicate springs or complicated mechanism.

THE Victoria Street Garage and Showrooms, 94, Victoria Street, Westminster, on Saturday afternoon received a cable from Australia asking them to try and procure a Renault car complete with body, hood, and all accessories. These were bought, packed and delivered on board at Tilbury Docks by Tuesday, and left by the mail steamer two mornings later en route for Australia.

SOME of the modern characteristics of the ancient city of York, which has been the scene of a motor-car exhibition during the last few days, are well brought out in a pamphlet published by Messrs. J. E. Gibbs and Company, whose garage facilities have been of service to many motorists journeying north. Their workshops are well equipped not only for the repair of motor-cars, but also the construction of steam wagons for haulage purposes.

OLEOBLITZ is the name of the lubricating oil which has assisted many Italian motorists to prominence in the automobile world during recent months. Its pre-eminent quality is the resistance to high temperatures, Oleoblitz being produced from oils treated by special refining processes, imparting to it the property of not being liable to decomposition at the temperatures usually obtaining in the cylinders of motors. It is free from acids, resins, tar and other substances capable of yielding residues or corroding metals. To suit the varying requirements of the automobile it is made in several degrees of density, viz., liquid, thick and extra thick, while a medium type has been prepared for motors with a fan-cooling arrangement. Some idea of the esteem in which this lubricant is held in Italy is found in its selection by the National Touring Club as the lubricant to be supplied to its depots on the main roads. Here it is being placed on the market by Messrs. Bertelli and Co., 1, Albemarle Street, W.

CORRESPONDENCE

[Letters to the Editor should be addressed to the office,
87-88, Charing Cross Road, W.C.]

ARE CARS TOO COMPLICATED?

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the interesting article on this subject in the *M.C.J.* of the 2nd inst., we are great believers in simplicity, and in designing the N.E.C. cars have devoted a great deal of thought and time to securing the utmost possible simplification. It seems to us obviously the right policy. The fewer the parts the more simple is the car to fit up, and, therefore, the more likely it is to be correct when delivered. The simplification both in the number and the complicity of parts unquestionably cheapens production, and also cheapens the upkeep.

It is always a marvel to us that a car with five pedals can find a purchaser. To learn to drive such a car must be like learning to play an organ. We manage to do everything we require with two pedals, and we only have one lever. Our carburettor and float chamber are all complete in one casting, and we have only one piston valve, which operates both the main throttle and the auxiliary throttle which keeps correct the proportions of petrol and air. The clutch, too, we think, should certainly be kept as simple as possible, and for this reason we

paid mechanic. You speak of cars having as many as five pedals. I saw one in the Strand the other day that had no less than six. Seeing that the ordinary human being has only two legs, one wonders what the driver might do, or might not do, if he found himself in a tight corner when safety depended on prompt action. To my mind no car should have more than two pedals—clutch and foot brake; two side levers—change-speed and hand brake; and two levers on the steering wheel—throttle and ignition. That it is possible to properly operate a car with less than these there can be no doubt, as I recently enjoyed a run on one which had only two pedals and two side levers, the steering wheel and column being absolutely free of any encumbrances of the kind; and if one designer can so simplify his vehicle, what is the reason and what is the good of multiplying pedals and levers to such an extent as is done by some manufacturers?—Yours truly,

ARGONAUT.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to your remarks on this subject I may say that I am thoroughly in accord with M. Baudry de Sannier, so far as the fitting of an excessive amount of pedals and levers is concerned. I certainly think that preferably not more than two or at the very most three pedals ought to be the limit, and the number of hand levers to which the driver has to give attention ought certainly to be kept down to a minimum as well. To fit five pedals on the car is a very near approach to courting disaster, as in some emergency the driver is almost sure to operate the wrong pedals, and to find out his mistake too late to avert disaster.

Where, however, complication has been introduced to render the vehicle as a whole more reliable and more efficient, then there is ample justification for such complication. The tendency of design should be

The Jamaica Earthquake.—A Temporary Encampment in the Grounds of the Jamaica Club.

have adhered to the old type of leather and metal cone. Brakes, too, we think, should be kept as simple as possible. Then on our own cars we have suppressed the water pump and depend entirely upon thermo-syphon action for water circulation, with excellent results. A separate fan, too, has been abolished, and instead we have a fan on the rim of the flywheel.

We have suppressed every part that could be suppressed and made each item in itself as simple as possible, but there are certainly some parts of a car where we think the simplest possible arrangements are not desirable. For instance, in the lubrication of the engine and in the use of ball and roller bearings throughout the gear-box and axles. The old-fashioned splash lubrication cannot, we think, be compared for efficiency with a system in which the oil is kept constantly flowing over the parts to be lubricated by means of a pump. The essential feature of this system is a large filter and reservoir where all dirt and foreign matter is collected, and it is imperative that this filter should be readily accessible and easily cleaned. We are very much against complications being introduced by fitting duplicate form of ignition. We believe it is far better to stick to one system and thoroughly duplicate the parts.—Yours truly,

J. C. MORT.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am glad to see you drawing attention to the growing complication of motor-cars, and trust that now the question has been raised some efforts will be made by motor-car designers in the opposite direction—that of simplifying automobiles. As at present built, many vehicles with multi-cylinder engines cannot be used except by those who are sufficiently well off to be able to afford to employ a highly-

to make as many of the functions of the engine and mechanism automatic as possible; for instance, lubrication, control of ignition advance, supply and richness of mixture, these undoubtedly can be much better left to be automatically regulated by the engine, thus making the vehicle simpler to manage and probably more efficient, as even the most careful cannot give constant attention to all these matters.

Having provided for the automatic control of these and any other functions which may conveniently and economically be controlled in such manner, the aim of the designer should be to simplify the vehicle as a whole wherever possible without sacrificing anything to efficiency or simplicity of handling. Of course, at the present time, there is a large class of buyers who make a hobby of fitting to their cars all sorts of more or less useful accessories, many of which are quite unnecessary, but this can scarcely be used as an argument to prove that motor-cars are becoming too complex in construction, as they are purely accessories to the standard vehicle.—Yours truly,

T. BLACKWOOD MURRAY.

EXHAUST VALVE TROUBLES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Mr. Wootwell's letter in the last issue, his car is apparently fitted with one of the old two-cylinder Phoenix engines, and I am afraid that the job that he has had done, i.e., valve guide bored out and a thicker valve fitted, is the cause of his trouble. Evidently the boring has been badly done, and therefore the valve stem does not now align with the tappet. It is possible, of course, as he suggests, that the latter has not been re-assembled properly, but it is difficult to guess what error can have been made in putting this action together. In any case the idea of fitting a penny on the top of the tappet

will not be of the slightest use; nothing but hard steel is any use where such hammering as is occasioned by lifting exhaust valves is concerned. The best thing to do is to have the valve guide bored out and then bushed to take a standard size Panhard valve, and at the same time the seating can be trued up with a proper rose cutter. Odd-sized valves—or anything else, for that matter—are a nuisance, and the aim of competent repairers should always lie in the direction of letting their work adhere to the makers' standard sizes.—Yours truly,

C.

LOSS OF POWER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be very much obliged if any of your readers could let me know if they have had experience with a 22-h.p. Minerva (1906) car. My machine runs very well on first and second speed, but when on top the power seems to die away, sometimes even on the level. I think myself it is the carburettor that is to blame. It seems to fail to give a sufficient quantity of gas to the engine when on top speed. I have had it in experts' hands several times, but they do little or no good to it.—Yours truly,

CARBURETTOR.

[We are inclined to think that our correspondent's trouble is due to the carburettor, owing, no doubt, to too much air being admitted when the engine is running slowly, although when running at high speed on the first and second gear the mixture is of proper proportions. If the carburettor is fitted with hand control of the air admission, it might be closed a trifle when changing to top gear and opened as the car increased in speed; or, if automatic, we would advise adjusting the airway to admit slightly less air.]

A French Public Service.—A Snapshot from Honfleur.

FOUR OR SIX CYLINDERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a motorist of considerable experience during the last ten years, may I be allowed to question the verity of Mr. Weigel's statements and corroborate those of "Engineer" in the last issue of the *M.C.J.*? The chief and only objections to six cylinders are, I understand, first, complication, and second, expense of running; and the main question is, are they worth the extra outlay? I take the liberty of denying these charges, and would impress upon you that I am in no way connected with the trade, I am not the possessor of a six-cylinder car, and therefore am in no way prejudiced. While deploring the fact that cars, as a whole, are too complicated, I cannot but clearly see—and it is necessary for me to resuscitate arguments long since buried in oblivion—the advantages of four, three, and two, over one cylinder. And to attain a higher standard of perfection in the existing type of petrol engine than that hitherto reached by four cylinders—that standard being a series of perfectly evenly distributed impulses, or, an impulse at every stroke—it is necessary to augment the number of cylinders. The number has been increased from one to two and four; not attaining the above standard, it has necessarily advanced to six. The six-cylinder engine has undoubtedly attained the standard.

In answer to the next question, "Cost of running," I argue that the amount of petrol to feed six cylinders of 301 inches capacity is less than the amount to feed four of 456 inches, and for flexibility the six-cylinder engine ranks first, despite various advertisements to the contrary. Thus undue wear on the gears is avoided, and depreciation lessened. Further, the more even the impulse, the less wear on the tyres.

The last question, "Do six-cylinders warrant the extra outlay?" is easier answered by the query, "Is there any extra outlay?" A six-cylinder 40-h.p. chassis is now on the market, price £375, built in London by expert mechanics and of the finest material. Another English firm

produces for £600 a six-cylinder car complete. While comparing higher priced cars, the prices of the Napier vehicles are far surpassed (per h.p.) by both Panhard and Mercedes. Need I say more? Mr. Weigel's statements are very naturally based upon trade prejudice, and very rightly he defends his own cause, and remains loyal to the car that bears his name.—Yours truly,

H. SCOTT.

WIRE OR WOODEN WHEELS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to "K. J. G.'s" letter re "Wire or Wooden Wheels," in the *M.C.J.* of the 2nd inst., it would be interesting to know whether your correspondent has actually tested the relative strength of these wheels. He is rather illogical when arguing in favour of the latter. He states that when a wire wheel skids or hits a kerb it is liable to buckle, due to the fact that a compressing stress (strain?) occurs. Now the only compression strain set up under these circumstances is in the lower half of the inside spokes and the upper half of the outside spokes. But now comes the chief point. For every portion of an inch that these spokes compress the corresponding spokes on the other side of the wheel stretch to the same amount. Suppose that the wheel contains forty spokes, twenty of which are in compression and twenty in tension, then, presuming that each spoke has an elastic limit of one ton, we can clearly see that the spokes in tension are capable of standing a tensile strain of twenty tons. Now suppose that the spokes are fixed to the hubs at an angle of 20 deg. with the vertical, we see that any side strain has a mechanical advantage of cot 20 deg. over the spokes. We can thus roughly put down the strength (in a horizontal direction) of wire wheels as $\frac{2}{\cot 20}$ tons pressure = about 6½ tons.

Let us now consider the wood wheels. Since the spokes in the majority of cases are vertical, the mechanical advantage of any side strain is cot 0 deg. or infinity. We thus clearly see that the tensile and compression strengths of the wooden spokes are of no use whatsoever. The value of the wheels evidently depends upon the shearing or breaking strength of the spokes. Now the number of these is about twelve, and their area of cross section about one square inch at their weakest part. The strength of these wheels works out to be about 1½ tons in a horizontal direction. In practice I have broken an axle clean off by striking the kerb with a wire wheel; for obvious reasons I afterwards wished that the spokes had been wood. I quite agree that the wooden wheels are smarter, but all is not gold that glitters. I might add that light racing cars almost invariably have wire wheels, as, weight for weight, the wire wheel is about five times as strong as the wooden one.—Yours truly,

H. B. D.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We are much interested to see that Mr. S. F. Edge has fully realised the inadequacy of the wooden artillery wheels when fitted to motor-cars, but he suggests a retrograde movement when he proposes to utilise wire wheels in place of these. We are pleased to say that there is no need for this, as our Messrs. Easton and Jones have recently patented a method of construction which will enable built-up steel wheels to be constructed at approximately the same price as wooden artillery wheels, and, while the appearance is practically the same as wire wheels, yet the strength is at least four times as great. We are sure that this fact will be welcomed, as the majority of car owners prefer to risk the insecurity of the wooden wheel rather than adopt the ugly wire wheel.—Yours truly,

THE MOTOR HOUSE.

THE FLEXIBILITY TRIAL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—My attention has been called to some circulars and entry forms which I have received in connection with the Motor Flexibility Open Competition, organised by the Crystal Palace Automobile Club, to be held on Saturday, the 23rd inst., and I now wish to draw your attention, and that of the readers of the *M.C.J.*, to a few details of this wonderful competition. The first thing that surprised me very much was that the Club had consented to the competition being held, but probably they had not carefully studied the rules. I think that the trade and every owner of a four-cylinder car should entirely boycott the whole thing, for it is grossly unfair, and, in my opinion, misleading. What owner of a four-cylinder car, with any respect for his engine, would enter a competition in which a premium was placed upon cars that would start on top speed, and travel to Hexhill on top speed? Of course it can be done—that we all know—on either a two, four or six-cylinder car, but I do not think any man in his right senses would consider there was anything to be proud of in doing it. It is my belief that the competition has simply been got up in the interests of a certain make of six-cylinder cars, and I do not think it would take me long to find a number of people who would agree with me.

From Clause 10 of these rules—which, by the way, are very ingeniously drawn up—I find that "a slow speed driving test on top

gear, without use of clutch or brake," will be held. Is this for a six-cylinder, or a four? I should like to know. And, if a man enters with a four-cylinder car, he has, if he has an up-to-date car, four speeds, therefore which will be his top speed? I suppose his fourth, and as a six-cylinder as a rule has only three, the top speed of that must be the third. The four-cylinder is at a disadvantage; in fact, this is such a stupidly got-up scheme in favour of six-cylinder cars that I am surprised it should not have been labelled a competition for six-cylinder cars (and shut out all others), because that is what it really is. When I first received the papers I threw them in the waste paper basket, but, thinking there might be some who would take the matter seriously, I decided to go into them further. Look at the opening statement, as follows:—"It having been suggested to the Crystal Palace Automobile Club that an open competition to decide the respective merits of flexibility between two, four, six and eight cylinder motor-cars should be held in order to have the claims settled by public tests, the competition has been organised with that object in view." I would ask the Crystal Palace Automobile Club, Who, except a certain little crowd interested in a certain six-cylinder car, ever suggested this?

To sum up briefly, it seems to me that a certain section who are great on pushing a six-cylinder car are anxious to get up a competition on their own account, and are trying to make the public believe that it is a competition open to all cars. What surprises me more than anything is the fact that the Club should have lent its name to it, for I consider it very misleading to the public, because it is not fair to test the respective merits of flexibility alone between two, four, six and eight cylinders. After all is said and done, what is the flexibility compared with the reliability of a car? If there is to be any competition between four and six cylinders, let it be organised by the manufacturers of four and six cylinder cars; let them meet and arrange with the Automobile Club to get up a proper test that the public can follow, and do not let the question of flexibility alone enter into the competition, but let every thing that goes to make a good and reliable car be taken into consideration, such as hill climbing, petrol consumption, &c. Let the Automobile Club take it up, and see it through, and be fair to both sides, in the interests of automobilists at large.—Yours truly,

W. M. LETTS.

SOME REMARKS ON RADIATOR FANS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was much interested in the article on this subject by Mr. Craig in the last issue of the *M.C.J.* To my mind the fan behind the radiator is a thing which the sooner discarded the better, and I certainly favour the flywheel fan even at a slight loss of efficiency. It tends toward simplicity of construction. All unnecessary paraphernalia should be eliminated from motor-cars; the discarding of the fan would slightly shorten the length of the bonnet, allow the motorist to work about the front of the engine in safety, remove a fruitful cause of petty derangements, and slightly reduce manufacturing costs.—Yours truly,

J. WORTHINGTON.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the article by Mr. Craig in the *M.C.J.* of the 9th inst., I should like to point out that if the fan is placed quite inside the hood, with a clear space of at least two inches around the tips, the hood being drawn in to the diameter of the fan behind the blades, the efficiency of the fan will be 25 to 30 per cent. greater than if the fan tips are enclosed in a tubular prolongation of the hood, as is often seen. In a 15 in. fan, as mentioned by Mr. Craig, it is well to close up the central portion of the fan, and only use the outer 4 in. of the blades.—Yours truly,

A. GRAY.

ELECTRIC HORNS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—There has been some argument lately in your *Journal* respecting electric horns, and I venture to suggest that my experiences with these same may interest your readers. Last October my employer bought an electric horn. I have just put on the third battery, the two previous ones running exactly two months each. The car is used almost every day, and we do a lot of touring with it. Consequently the horn is used a great deal, the fact of it being so easy to work causing one to use it more; the platinum adjusting screw is outside and easy to clean or adjust, which I have had no occasion to do yet. I may say the sound, although flat, is penetrating.—Yours truly,

L. F.

ACCESSIBILITY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read the abstract you gave in a recent issue of the *M.C.J.* of Mr. F. L. Martineau's recent paper on "Accessibility and Cleanliness," and consider that motorists generally should be grateful to him for having at last drawn attention to these matters. The subject of accessibility is one that has, in the past, been greatly neglected, and although considerable improvement has lately been effected, yet there are many cars which fall far short of what may be termed the

acme of accessibility. One possible explanation of the many "unget-atable" parts on cars is to be found in the fact that the designer has kept the chassis in his mind's eye at all times in working out the various locations of the different portions of the mechanism. The body is something with which he has nothing whatever to do; the frame dimensions are given to the carriage builder and he does the rest, this being the case particularly where the chassis is supplied by one firm and the body by another. Given the chassis alone nothing could be simpler than to reach any part of the mechanism with the proper tool to adjust it. In this connection it will be recalled with what persistent frequency show salesmen demonstrate this point on the polished chassis usually found at exhibitions. The interested listener is delighted, and if he happens to have had previous experience in the opposite direction this may be the deciding argument that brings his order. But leaning over a chassis that is mounted at exactly the right height to make it more convenient and is moreover absolutely devoid of every impediment, such as steps, mudguards and the like, not to speak of the body, and doing the same thing on the road, or even in one's motor house, when all these are in place, is a far different matter. Accessibility is naturally a variably quantity and may mean totally different things to different designers, but when it is necessary to take off the body in order to reach a part that is at all prone to go wrong on the road, the motorist may well be permitted to think things of the man who was responsible for the design. To my mind anything less than a serious mishap should be capable of repair either on the road or in the stable without the necessity of reducing the car to its chassis in order to reach the affected part, and until this has been attained the designer can scarcely be said to have achieved more than a fraction of what is represented by the word accessibility.—Yours truly,

A TEN YEARS' MOTORIST.

Paris "Cabmen" Up-to-Date!

A NOVEL TRANSMISSION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a regular reader of your valuable paper, and also as a motorist, I have followed with great interest the discussion re simplicity, accessibility, &c., on motor-cars. I am a practical engineer of some seventeen years' experience and have designed a combined axle and gear-box, which also dispenses with a clutch, the cardan shaft extending direct from the crank shaft to the live axle. It is not a clumsy affair at all, and the difference in size of the differential box is scarcely noticeable. It is absolutely fool proof and can be operated by a small quadrant on the steering pillar. As I have not yet obtained protection for it I cannot, of course, furnish you with drawings. But, if any of your manufacturing readers are interested in the matter, I shall be pleased to demonstrate the working and advantages of the arrangement as soon as I have done so.—Yours truly,

H. MILNES.

A CHANGE-SPEED GEAR TROUBLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Perfect Pinion's" letter in the *M.C.J.* of the 2nd inst., re excessive wear on small gear wheel of a 12-16-h.p. Peugeot, this is undoubtedly owing to its having insufficient mesh, which is relatively due to the wheel being too small in diameter. Possibly, too, the lay shaft has been turned down at some time to accommodate a new wheel, and consequently the shaft is not stiff enough and requires more support. The shaft bearing this wheel should be taken out and put between the centres of a lathe and tested for truth. A little bit of wobble on the shaft will throw the wheel out a lot and cause the crunching sound complained of. The keying of the wheel also must be inspected so as to ascertain the true running of the pinion on its shaft. Assuming that "Perfect Pinion" is satisfied on the points mentioned, attention must next be turned to the bushes. Do they fit? Are they bored in the centre, and could the wheels be brought closer together? If it is possible, link the two shafts together with a piece of 3-8 in. steel plate inside the gear-box. Longer bushes might be fitted the next time

they are necessary, and another tooth in the wheel if the gear-box bearing distance will allow it; and especially be sure that the wheel is square with the lay shaft. Oh for a centre bearing in gear boxes!—Yours truly,
HERBERT J. CHAPMAN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—“Perfect Pinion’s” trouble, as mentioned by him in the *M.C.J.* of the 2nd inst., is probably due to the bearing at the end of the shaft when the slow-speed pinion is being badly worn, and allowing the slow speed to be partially out of mesh. The fact that the box is inclined to spring is not conducive to long life for the bearings.—Yours truly,
R. C.

THE CONSTRUCTION OF AN INSPECTION PIT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to “Rotherham’s” query in a recent issue of the *M.C.J.*, an inspection pit is such a great convenience that the owner of a car who keeps it on his own premises will never regret the cost of its construction, which need not be heavy. There are many times when it is desirable to get under the car to do some odd jobs or to clean the lower part of the gear-box or crank case. It is better, in my opinion, not to have the pit in the stable itself, but outside, unless the stable be very large and well lighted. The car should be washed and cleaned outside on a little cement or asphalt floor, so that its resting-place may always be neat and clean, and not sloppy, greasy and generally dirty, as is too often the case.

In order to be able to accommodate all sizes of cars, a pit should be of the following dimensions:—9 ft. 9 in. long, 2 ft. 9 in. or 3 ft. wide and about 3 ft. 6 in. deep. To the above mentioned length of the pit, properly so called, should be added that of four steps, each step being 8 in. deep and about 5 in. high. The bottom of the pit should have a gentle slope towards a drain pipe, and the latter, which is absolutely necessary, should have a trap. The pipe should have stout wire gauze over it to prevent foreign substances from choking it up. When a car is not over the pit it should be covered with removable floor boards so as to prevent anyone from falling in. The above described construction may, of course, be modified or simplified according to individual ideas or requirements.—Yours truly,

T. DICKINSON.

AUTOMATICALLY ADVANCED AND RETARDED IGNITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As an enthusiast, though not technical expert in motor matters, I have noted with interest the appearance of a number of cars in which the ignition control is combined with the lever actuating the throttle, and, later still, several in which the advance and retard of the ignition is automatically controlled in accordance with the speed of the engine. The first vehicle in which this method was adopted was, I believe, the Brotherhood; since then the little Sizaire-Naudin car has come along, and now the Germain concern are, I understand, applying it to their motor-buses. It would, I am sure, be of interest to many of your readers, as it certainly will be to myself, if any motorist who has had some experience with a car in which the ignition is automatically regulated to suit the speed of the motor would recount the same in the pages of the *M.C.J.* So far as I can see, the arrangement entails a little more mechanism under the bonnet, but if it works well in practice, this addition should be more than counterbalanced by the abolition of the usual ignition lever on the steering wheel or column and the simplification of the work of successful car-driving which such reduction in the number of levers carries with it.—Yours truly,

W. PICKERING.

LUBRICATION TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Mr. Young’s letter in the last issue of the *M.C.J.*, the cause of his trouble is no doubt due to the pressure in the crank case. To overcome this, a large valve should be fitted, a small ball-valve not being sufficient to release the pressure. In some cases a pipe is brought from the crank case straight up sufficiently high to prevent the oil blowing out. The cylinders will get well lubricated from the splash in the crank case if plenty of oil is kept in.—Yours truly,

T. H. A.

LETTERS for the Society of Automobile Mechanic Drivers should be sent to the secretary, Mr. G. T. Clarke, Rawling’s Garage, Halkin Street, Belgrave Square, W.

MESSRS. E. H. BENTALL and Co., of Heybridge, Maldon, have laid down special plant to deal with the increasing demand from the trade for their motor valves.

WORKS ORGANISATION.*

By PERCY MARTIN.

A WORKS must produce that which can be sold at a profit, and the sales organisation must aim to sell that which a given works, with given facilities, can best produce, and also the company policy must be formed with due consideration for the limitations of both. It is fatal to ask impossibilities of either.

I shall lay stress on the necessity of specialising your products, and duties of men, but, as an exception to this rule of specialisation, let me cite the case of the department head, who must know enough of what other departments are doing to find his bearing with reference to the whole. He must understand the company policy in order to be able to manage his own department for the benefit of the whole. Some may contend that their results are not a commercial or financial success, in spite of being guided in their efforts by exactly the same principles which I am about to define, and I say that the reason is, although the principles of organisation of individual departments may be entirely correct, yet failure is not eliminated because of the loss of energy through lack of co-operation of the departments.

Many failures are due more to the loss of energy in the shape of internal friction in the organisation than to any other cause. In laying down the general principles of works organisation, I am not giving a description of the Daimler works and its methods.

Not having my subject qualified as to any specific production of a works organisation, it would be futile to deal with any special phases or problems which depend chiefly on local conditions and nature of products for their solution. My aim will be to give a few hints on how to spend money wisely on what are generally known as “non-productive departments.” The departments I have in mind are:—

THE WORKS STAFF.—Incorporating chiefly departments for cost-keeping and stock-keeping.

ENGINEERING STAFF.—Incorporating departments for original designing, production of working drawings, design of special tools and jigs, and a special department for the production of the latter.

SYSTEM OF INSPECTION.—Incorporating detail inspection and testing of the completed article.

Taking first the works staff departments, it is usually the function of the cost-keeping section to record expenditure of wages and material on each piece of work put through the shops; but who will deny that it is well worth the increased establishment expenditure to have a department which can not only produce sum-totals after the work has been finished, but which can produce before the work is started an accurate estimate of what the work should cost when completed?

KNOW YOUR COSTS IN ADVANCE.—I hold it as one of the fundamental principles of business that one should know the maximum, if not the exact cost of the article one is to produce before any serious production takes place at all. I have not said anything as to the necessity of costing, because this is admitted on all hands; but I would like to lay stress on the principles that your costs must be exact, or they may fail to be of use to you. Unless you know the exact margin you have to manipulate, you, or your salesmen, can never be quite sure whether quotations involve them in a slight profit or a slight loss, and it is easy to conceive of circumstances where, in order to gain a name or to meet competition, it is both necessary to get business and yet not to lose money.

The most effective manner in which to equalise costs, as regards material, is to hand over to the workman only the amount of material he actually requires, no more and no less. Should a mistake have been made in judging of the material necessary, the first man to produce an article will find out and demand more material, which ensures the matter being corrected through the medium of the storekeeper, who, by virtue of having received a copy of the well-distributed orders and specifications, will know exactly what material he is authorised to hand over to the workman on any particular order. One may ask what happens if a piece is inadvertently scrapped. This is one of the most important functions of the storekeeper, as the conscientious bringing-up of the scrapped pieces before the management is one of the most difficult orders to get properly obeyed. Yet the scrapped work is exceedingly instructive from a considerable number of stand-points. It enables one to judge of the efficiency of the workman, the quality of the material supplied by the purveyors, and the possibilities as regards improvements in design. When the workman is forced to apply to the storekeeper for fresh material to replace that which he has scrapped, it enables the latter to replenish the stock, both raw and finished, without waiting, as is often the case otherwise, until the end of the order, and incurring the consequent delay and unpleasantness through a batch of articles lying nearly complete, waiting for some trifle scrapped, not recorded and ordered months before.

The obtaining of accurate costs is facilitated to a considerable extent by the method of payment of wages used. Generally speaking there are three methods, namely, day work, or hourly rate system, the piece work system, and the premium bonus system. The first two most certainly do not enable one to arrive at accurate costs. The premium bonus plan gives, in any case, a “limit cost,” the bonus paid away representing further profit to the company and the men over and above expectations, and if time allowances are properly fixed these

*From a paper read at the meeting of the Institution of Automobile Engineers, on March 13th.

busses can be taken into consideration and allowed for. Having settled the costs beforehand, all that is necessary is the preparation of statistics with a view of assisting the management in the control of certain classes of expenditure. Statistics worked out in the form of curves are probably the most useful, as figures do not convey such a clear idea of the position of the expenditure as a curve of comparisons. One of the other departments of importance, the management of which usually comes under the works staff, is stock-keeping. Properly kept stock records are, therefore, essential to an organisation, and the concentration of data on to a stock record, planned on the loose leaf system, is what is required. Each stock sheet represents one particular material. These sheets are classified and indexed, so as to be easily referred to. They should consist of a double-sided ledger, giving as debits to the stores the materials ordered, balanced by material delivered, and on the credit side the requirements of various shop orders, balanced by issues from stores. The stock sheets may be made far-reaching enough to indicate, in addition to the above facts, also the weight of castings, the varying price of materials, &c. This information would enable invoices to be verified and the weight of various rough stampings, castings, &c., to be checked.

The next section of the so-called "non-productive" departments is that of the engineering staff, comprising, first, the department for original design and the production of working drawings; secondly, the design of special tools and jigs, and an independent department for their production and upkeep; and thirdly, a system of inspection between operations. The first department, which may be designated constructional engineering, should follow the policy of the company as to the articles designed. One is inclined to develop an organisation which can, in a more or less routine way, successfully standardise, improve, and, in fact, develop the design from day to day, or from year to year, of any article under consideration. In the first place there is the principle of standardisation applied to the design of the article—that is, the simplification of the design as far as possible, and the utilisation of parts which are already known to you as having withstood the test of experience in your earlier designs. Designs should rather be evolved from previous practice than completely revolutionised, because this reduces the possibilities of failure from an engineering standpoint, and the cost is also lowered to a tremendous extent right from the start. In the second place, the constructional draughtsmen should produce drawings on each of which is incorporated all the information necessary and useful for staff and shops, such as quantities, limits, style of finish, kind of material, &c. Further, this principle is also to be kept in view, viz., that in addition to cleverness, ingenuity, and originality of design, the fact must not be lost sight of that the design has to be produced in your shop, with its limited facilities, and that as cheaply as possible. It is necessary for drawings to be complete ones; nothing should be left to the judgment of the workman, however simple and obvious the job looks.

The working drawings are then considered from the point of view of manufacture, which is to be effected both quickly and cheaply—that is to say economically—and this brings us to the second portion of the engineering staff, viz., the design of special tools and jigs. These tools and jigs are made in accordance with the requirements of manufacture. That is, in the case of engineering works being engaged on repetition work, a considerably greater expenditure on special tools and jigs is permissible than if the design is to be carried out only once or a limited number of times. Great attention should be paid to the department which designs special tools and jigs, and the work of sketching these special tools, jigs, and fixtures should, like the working drawing itself, be done with extreme care and accuracy, and with proper exercise of brains and judgment, as the subsequent manufacturing costs depend to the greatest possible extent on this class of designing. The third consideration in regard to the engineering section is that relating to inspection. This has the double advantage of locating any fault or scrap on to a single individual, thereby doing only justice to the other operators, and it, furthermore, enables a check to be put on the bonus to be paid to each individual operator. When the working drawing is produced, and the jigs and special tools have been designed, the progress through the shops arranged for and the points of inspection settled, the question of material is brought to the fore. Specifications of material are prepared from the information given on the drawings, and the specifications having been distributed thoroughly, enable orders to be placed in the economical manner previously described, and the material to be received into stores and put out to the particular workmen in need of it.

(To be concluded.)

MESSRS. GOLDSMITH AND WILLS, of the Waterloo Motor Garage, have been appointed agents for the county of Hertfordshire for the "Weigel" cars.

MEXICO is the latest country in which arrangements have been made to push the Napier six-cylinder cars; three 40-h.p. six-cylinder vehicles have been purchased for that market within the last few days, one of which was despatched within a week from the receipt of the order.

FROM the Scottish Motor Engineering Company, Ltd., Granton Harbour, N.B., comes a copy of the 1907 catalogue of the Granton motor-buses and commercial vehicles, which are made in three sizes—12-h.p., 24-h.p., and 45-h.p.

CLUBS AND ASSOCIATIONS.

A.C.G.B.I.

ARRANGEMENTS are now in operation by which members of the A.C.G.B.I. going to France by the Folkestone-Boulogne, Southampton-Havre, or Newhaven-Dieppe routes can obtain tickets at the clubhouse, where also particulars with regard to the transport of cars across the Channel can be obtained.

The vehicles entered in the Vapour Emission competition to take place on Tuesday next are as follows:—16-20-h.p. Chenard-Walcker; 40-h.p. Napier; 30-35-h.p. Lotus; 24-h.p. De Dion-Bouton; 32-h.p. Pilgrim; a 10-12-h.p. car entered by Mr. J. T. Newell; 35-45-h.p. Ariel; 16-h.p. Albion; 24-h.p. Albion; 18-24-h.p. Austin; 25-h.p. Straker Squire; 26-h.p. Belsize; 20-h.p. Lanchester.

Sir Laurence Jenkins and the Hon. R. T. G. Murray have been elected to membership of the Club.

The committee for the ensuing year has been constituted as follows: The twenty-five members who did not retire this year are:—Capt. F. E. Dyke Acland, Messrs. A. Armitage, T. H. D. Berridge, M.P., Alfred F. Bird, T. G. Chambers, E. H. Cozens-Hardy, Lt.-Col. R. E. B. Crompton, C.B., Charles Hardy, Dr. H. S. Hele-Shaw, F.R.S., E. M. C. Instone, G. C. Ashton Jonson, Major F. L. Lloyd, R.E., E. Manville, J. R. Nisbet, Wilson Noble, J. F. Ochs, Mervyn O'Gorman, Dr. H. E. Bruce Porter

An old Toll Gate near Philadelphia.

Lionel de Rothschild, J. D. Siddeley, Stanley Spooner, Hon. Arthur Stanley, M.P., Henry Sturme, Dr. J. Hopkins Walters and Claude Watney. The twenty-five members elected by ballot are:—Col. H. C. L. Holden, R.A., F.R.S., Messrs. C. D. Rose, M.P., Professor C. V. Boys, Sir Boverton Redwood, Col. David A. Kinloch, F. H. Butler, Sir Henry Norman, M.P., Major T. H. Cochrane, F. P. Armstrong, Commander Mansfield Cumming, R.N., Capt. G. H. J. Skeffington-Smyth, D.S.O., W. Worby Beaumont, Henry Edmunds, J. Lyons Sampson, Capt. R. K. Bagnall-Wild, R.E., Robert Todd, Vere Ker-Seymer, W. J. Leonard, the Hon. C. S. Rolle, Capt. H. H. P. Deasy, J. M. Gorham, Earl Russell, Major W. E. Donohue, E. Russell Clarke and T. C. Aveling.

During the past few weeks several members holding the Club's driving certificate have obtained the French certificat de capacite, or driving licence, prior to their departure from England. Members who wish to avoid the formality of the driving examination in France, which is a necessary preliminary to the issue of a French permit under ordinary circumstances, are advised to write to the secretary.

The annual meeting of the Club held on the 8th inst. was largely formal. A proposal by Mr. Frederic Coleman limiting the voting powers of committeemen engaged in motor-car business not being put to the meeting—a majority of those present voting in favour of such a course. Only two changes took place on the committee, Messrs. E. Russell Clarke and T. C. Aveling taking the place of two retiring members.

AUTOMOBILE ASSOCIATION.

VISCOUNT COMBERMERE, Lord Bernard Gordon-Lennox, Lady Gertrude Crawford, the Master of Sinclair, Colonel H. R. Armitage, Major J. W. Sears, Major J. Cotesworth, Major R. S. Ruston, Major Edward St. Aubyn, Capt. E. G. Hardy, Capt. H. C. Bickford, Capt. G. M. H. Stirling, D.S.O., Capt. Washington Hibbert, Capt. N. M. Gray, Rev. H. G. Sprigg, and Dr. A. E. Kinsey-Taylor have joined the A.A.

ROYAL AUTOMOBILE CLUB DINNER.

UPWARDS of 400 motorists assembled at the Hotel Cecil, London, on Friday, the 8th inst., on the occasion of the annual dinner of the Royal Automobile Club of Great Britain and Ireland, when the Hon. Arthur Stanley, M.P., chairman of the Club, presided. Among those present were the Turkish Ambassador, the Spanish Ambassador, the Portuguese Minister, Sir H. H. Cozens-Hardy, Master of the Rolls, Lord Eversley, Lord Montagu of Beaulieu, Lord Borthwick, Sir W. Davis-Goff, Sir Boverton Redwood, Sir Henry Norman, M.P., Major-General F. W. Benson, Colonel W. J. Bosworth, and Mr. Julian W. Orde.

After the loyal toasts had been honoured, Sir H. H. Cozens-Hardy, the Master of the Rolls, proposed "The Club." He said that that body had already done a great deal of good work, and he would make bold to prophesy that it would do more. It did not seem long since he was in the House of Commons, yet at that time such a thing as the motor was practically unknown in a contest for a seat in St. Stephen's, whereas nowadays it would seem that there could not be either a Parliamentary or a municipal contest without an array of horseless carriages being requisitioned by the supporters of either side. Some members of that staid and respectable body, his Majesty's judges, had been seen riding from their houses to the Courts in motor-cars. To-day the community might be divided into those who liked and those who did not like motor-cars. Those who owned them liked them, those who could not own them did not like them. He believed John Bull did not like the foreign words that were associated with motoring, particularly the word "garage," and he was pleased to note that in a case heard before him in the latter part of last year the English language was not so poor that words could not be found for the car and the house in which it was kept. Referring to the work of the Club, he said that it had actively engaged in endeavouring to rid the road of a class of men who were a discredit to the movement. Then there was the dust nuisance that turned hedges white that should be green. Again, a special committee of the Club was actively engaged in trying to find a means to minimise, if not to do away with the nuisance. Further, he trusted the efforts of the Club would meet with success in abating that which in London had become a scandal and a disgrace—the noise of the motor-omnibuses, which he described as "the demons of the road." The club had done a great deal in the way of experiments aiming at the improvement of those vehicles.

The Hon. Arthur Stanley, in replying to the toast, apologised for the absence of the Duke of Sutherland, President of the Club, who had sent his heartiest greetings. He had listened with great interest to the speech of the Master of the Rolls, and congratulated him on behalf of the club and himself on his recent well-deserved promotion. He had been particularly interested to hear him say that motoring had spread so far as to reach uncivilised parts of the world to such an extent as even to affect his Majesty's judges. At all events, the Master of the Rolls would not have to ask in court, "What is a motor-car?" He then referred to the guests of the club that evening, among whom was the Turkish Ambassador—"who, of course, is becoming one of us, for he had ordered a car some time ago, and would have had it by now if it had been delivered when the salesman promised"—the Spanish Ambassador, the Portuguese Minister, and the Press. No medium had rendered greater service in spreading the movement than the Press. He wished to offer a few parting words of thanks for the kindness of all and sundry to him during the two years of his chairmanship of the Club. It was a happy parallel of the Master of the Rolls to have styled the Club the Motorists' Parliament. They might congratulate themselves on the manner in which they had done their work—better than they did it at Westminster. There were no suffragettes outside the Club House at Piccadilly, and the policemen on the beat had not a scratch on their faces. As to their future, he hoped to see them soon in occupation of the best club house in London, and possibly with a reduced subscription. He had authority to make an announcement of the utmost interest and importance to motorists, for his Majesty the King had been graciously pleased to order that henceforth that Club should be known as the Royal Automobile Club. They were all proud to receive such a mark of the Royal favour, and would continue to make yet greater efforts to ensure the success of the sport of motoring, of the industry, and of the social interests of the community whose welfare would be increased by the spread of motoring, and so they would endeavour to deserve the great honour that had been bestowed on them.

NOTTS.

A SPECIAL general meeting of the members of the Nottinghamshire Automobile Club was held in the Black Boy Hotel, Nottingham, last week to consider four resolutions down on the agenda in the name of Mr. A. R. Atkey. Over one hundred members were present. Mr. Charles Hardy was in the chair, and amongst those also present were Lieutenant-Colonel Birkin, Captain F. Hardy, Messrs. J. H. Kirk, A. Barlow, Dr. S. Tresidder, Dr. P. Tresidder, A. R. Atkey, Dr. Neilson, J. C. Wilson, W. D. Wells, G. Cohen, B. W. Winter, A. Lee, J. J. Spencer, S. Harvey, and Booth Granger (honorary secretary). The cause of the meeting being summoned was the manner in which the committee was selected at the annual meeting, at which certain members of the automobile trade took umbrage.

The resolutions submitted by Mr. Atkey were as follows:—(a) That in the opinion of this meeting the methods adopted at the annual

general meeting held on January 25th, to secure the elections of certain officers and committee, were not conducive to the well-being of the club; (b) That Rule 6 be amended by substituting 7 for 6 in line 2 and 15 for 10 in line 3, and to proceed forthwith to fill the vacancies thereby created; (c) That this rule obtain until December 31st, 1907, when it shall lapse, and the present rule be reverted to; (c) That vice-presidents who have been elected as such after virtue of signal service and long connection with the club shall not be subject to re-election so long as they continue in active co-operation, and desire to maintain their connection with the club. In moving the adoption of the first resolution, Mr. Atkey said he felt the club had radically departed from the principles which had hitherto guided them in the development of the club by their action at their annual meeting. If, however the members decided that what had been done was in the best interests of the club, he would support them; but he desired to come to a fair understanding. Mr. J. J. Spencer seconded.

Dr. Tresidder opposed the resolution. He maintained that it was not conducive to the welfare of the club that members gaining their livelihood by trading in motors and their accessories should hold office in it. The method of appointing officials adopted at the annual meeting was perfectly legitimate, and until recently it was the method adopted at all committee meetings when a vacancy arose. After other speakers had been heard the resolution was negatived by fifty-two votes to twenty-nine. Mr. Atkey said that as the feeling of the club was so obvious he would withdraw the other resolutions.

BLACKHEATH A.C.

THE annual general meeting and dinner of this club was held at the Art Club, Blackheath, on the first Friday in the month, Colonel Holden, R.A., in the chair. Fifty-six members and guests were present. The following officers were elected:—President, Colonel H. C. L. Holden; vice-presidents, Professor Carlton J. Lambert, M.A., Hon. Arthur Stanley, M.P., Mr. A. Roberts; committee, Messrs. J. H. Bowden, H. A. Cunis, J. S. Goodall, M.B., Colin Gordon, Ralph Lucas, T. Marshall, Dr. Gordon Parker, J. T. Prestige, jun., E. W. Stabb-Johnson, Fred Thorne; hon. treasurer, Mr. Hugh Beadle; captain, Mr. Arthur Jackson; auditors, Messrs. Ernest G. Annis and F. G. Nichols; delegates to Motor Union, Mr. H. A. Cunis and hon. secretary; hon. secretary, Mr. Leonard Beadle, 57, Foyle Road, Blackheath, S.E. A vote of thanks was passed to the retiring officers, Lord Hugh Cecil, Messrs. A. Roberts, and H. J. Fisher, which was acknowledged by Mr. A. Roberts.

When the business part of the evening was concluded, a musical programme was much enjoyed. Mr. Tom Browne, R.I., did two lightning sketches—A Knight of the Road, 1807, and a Knight of the Road, 1907; the former depicting a highwayman in full dress on Blackheath, the latter a chauffeur driving his car on the same common. Songs were also contributed by Mr. Tom Browne, and by Mrs. J. Harvard and Mr. Percy Beadle. Mr. Septimus Nickells was the accompanist.

EAST SURREY A.C.

THE annual general meeting of the above club was held on Saturday last, at the headquarters, White Hart Hotel, Reigate. The following members were present:—Messrs. H. Rosling in the chair; G. H. Bowden, H. Hughes, A. Gunning Keen, C. H. and J. Whittington, and D. J. Barry (hon. sec.) The annual report and summary of accounts was taken as read and adopted. The following officers were elected for the ensuing year (subject to acceptance of absentees):—President: Capt. R. H. Rawson, D.L., J.P.; Vice-Presidents: Sir A. Rendel, Sir G. Livezey, C.E., Major Kingsley, O. Foster, J.P., Messrs. H. Bell, J.P., H. N. Corbellis, and J. B. Purchase; Committee: Messrs. G. H. Bowden, N. Colman, E. H. Goad, H. Hughes, T. Owden Hart, A. Gunning Keen, H. R. Kempe, H. Rosling, C. H. Whittington, and J. Whittington; hon. secretary and treasurer: Mr. D. J. Barry, 50, High Street, Reigate; representatives on General Council of A.C.G.B.I.: Major K. O. Foster, J.P., and Mr. J. B. Purchase; representatives on General Committee of Motor Union: Messrs. D. J. Barry and G. H. Bowden; hon. auditor: Mr. A. Macaire; official repairers: Capt. D. J. Sweetzer, London Road, Reigate; Messrs. Stannard, Bros, 16, West Street, Reigate; Messrs. Chalmers and Co., High Street, Redhill; and Mr. C. Pippard, Motor Works, Oakwood Road, Horley.

THE MOTOR UNION.

ADDITIONAL interest will be given to the annual general meeting of the Motor Union, which is to be held at the St Ermin's Hotel, Westminster, on Wednesday next, by the fact that the Chairman, the Hon. Arthur Stanley, M.P., will present the Motor Union medal to those who were fortunate in winning it during the past year. Among these are included Captain Hughes Morgan, of the Herefordshire A.C.; Major H. Romkins, Stockton and District A.C.; Mr. F. Lindus Forge, Essex County A.C.; Mr. A. Cayley, North-East Lancashire A.C.; Mr. G. Bruce Gardner, Kent A.C.; Mr. E. H. Lancaster, Midland A.C.; and Mr. H. Musker, Sussex A.C. In addition, medals have been won by members of the following clubs:—Wolverhampton and District A.C., Southern M.C., Hertfordshire County A.C., West Surrey A.C., Derby and District A.C., Lincolnshire A.C., and the A.C. of North Wales.

INDUSTRIAL VEHICLES AT OLYMPIA.

THE first International Commercial Motor Vehicle and Motor Boat Exhibition at Olympia, W., was opened on Thursday, last week, by Sir Wm. Treloar, Lord Mayor of London. Although the building is by no means crowded with exhibits, an interesting collection of motor-buses and industrial vehicles has been got together. Dealing first with steam wagons, it may be mentioned that Messrs. D. Stewart and Co., Ltd., Glasgow, show a 5-ton machine on the Stewart-Thornycroft system, Mann's Patent Steam Cart and Wagon Company, Ltd., Leeds, a 2-ton wagon with locomotive boiler, for Messrs. Tangyes, of Birmingham, Messrs. Robey and Co., Ltd., Lincoln, a 5-ton gear driven lorry, Messrs. Jesse Ellis and Co., Ltd., a 2-ton and a 6-ton steam wagon, and Messrs. Straker and Squire, Ltd., a 5-ton lorry with locomotive boiler. The St. Pancras Ironwork Company, Ltd., are present with one of their 5-ton steam wagons with special fire tube boiler and patent rocking fore-carriage. Included in the exhibit of the Lancashire Steam Motor Company, Ltd., Leyland, is a Leyland five-ton steam lorry, of which a large number are in use in different parts of the country, especially in Lancashire. A couple of the well-known Foden 5-ton wagons are displayed by Messrs. Fodens, Sandbach, one being intended for Messrs. J. and H. Robinson, Ltd., Greenwich. Considerable improvements have been effected in the Yorkshire steam wagon, that now exhibited by the Yorkshire Steam Wagon Company, Ltd., having enclosed vertical compound engines and chain transmission. Messrs. Alley and MacLellan, Ltd., Glasgow, through their London agents, Messrs. E. W. Rudd and Co., exhibit two of the Sentinel steam wagons, and also a number of the component parts of the same. In addition to one of their tractors, Messrs. Wallis and Stevens, Ltd., Basingstoke, show a Wallis steam wagon. Steam tractors are shown by Messrs. Tasker and Sons, Andover, Messrs. Wm. Foster and Co., Lincoln, and Messrs. Robey and Co., Ltd., Lincoln.

One of the largest exhibits of petrol motor-buses is that of the Milnes-Daimler Company; three of the latest 28-h.p. German-Daimler chassis fitted with different types of bodies are on view, including a thirty-seated gallery char-a-banc for the Great Western Railway Company. Captain Theo. Masul presents the latest type of 24-h.p. Germain 'bus chassis, in which the engine is arranged under a bonnet instead of under the driver's seat as was the case in the earlier models. A number of improvements are to be found in the latest 35-40-h.p. Critchley-Norris 'bus chassis shown by the Critchley-Norris Motor Company; the clutch, which is of the leather-faced cone type, is fitted with an eccentric motion which enables it to be withdrawn with a minimum of exertion; special attention has also been paid to the lubrication and to the brakes. The Neue Automobil Gesellschaft, Berlin, exhibit a 24-26 h.p. double-deck 'bus and a 16-18-h.p. street-watering wagon, the latter having been built for service in Berlin. The exhibit of the Wolseley Tool and Motor Car Company, Ltd., comprises a 30-h.p. 'bus chassis, a 30-h.p. thirty-three-seated char-a-banc with canopy, an 18-h.p. ambulance with Elastex tyres, and a new 10-h.p. taximeter cab. Messrs. Durham, Churchill and Co., Sheffield, who are meeting with considerable success with their heavy petrol vehicles, show a 24-30-h.p. Churchill 26-seated char-a-banc, fitted with Aster four-cylinder engine and the Champion change-speed gear, the pinions of which are always in mesh. They also exhibit an 18-22-h.p. chassis, suitable for use as a 2-ton lorry or van, or as a single-deck 'bus. Fiat Motors, Ltd., show one of the latest Fiat 40-h.p. 'bus chassis with the engine under a bonnet, and a 40-h.p. 5-ton lorry built for the Soudan Government. Commercial Cars, Ltd., Luton, make their debut with a 30-seated char-a-banc or "country coach," the feature of the chassis being the change-speed gear. The pairs of pinions of the latter are always in mesh, the desired pair being made to transmit the power by means of dog clutches. The Lancashire Steam Motor Co., Ltd., exhibit a 35-40-h.p. double-deck petrol 'bus for the London Central Motor 'Bus Company, and a 31-seated char-a-banc fitted with a 50-h.p. four-cylinder engine. Another excellent example of a British-built motor-bus is to be seen in that exhibited by the Maudslay Motor Co., Ltd. It is fitted with a 35-45-h.p. engine and the White and Poppe automatic carburettor, and throughout bears evidence of careful design and construction. Messrs. Dennis Bros., Ltd., have a very interesting exhibit. Of the 'buses, reference may be made to a 40-h.p. vehicle with Aster engine and the Dennis worm drive, built for the London Road Car Company. The firm are also paying special attention to heavy petrol lorries and vans, and show a 40-h.p. brewers' lorry for Messrs. Wm. Hancock and Co., Cardiff, and a 20-h.p. two to two and a half ton van for Messrs. Carter Paterson and Co. The Ryknield Motor Company, Ltd., of Burton-on-Trent, who are now devoting special attention to motor-bus work, show a 40-h.p. chassis in which a number of special points are comprised, notably the single lever control of the throttle and the ignition, and the patent triangular under-frame, which prevents the pinions on the ends of the differential shaft, which drive gear rings bolted to the rear road wheels, getting out of alignment. Other points worthy of notice are the large radiator and the adjustable steering gear. A new range of Swiss-built machines is to be seen at the stand of Berna Motors, Ltd.; three models are staged, 16-18-h.p., 20-24-h.p., and 30-35-h.p.; the chassis of the latter is suitable for use as a lorry or as a motor-bus. The four-cylinder engines have low-tension ignition while the transmission is by a cardan shaft and bevel gear to a live axle. The Turgan commercial vehicles are displayed by the Cannstatt Automobile Supply Association; they comprise a 12-h.p. chain-driven

chassis suitable for a 15 cwt. van, a 24-h.p. 3-ton tip wagon, and a 30-40-h.p. 'bus chassis. Other exhibitors of motor-buses include the Beaufort Motor Company, Ltd., Messrs. J. E. Hutton, Ltd. (Berliet), the New Arrol-Johnston Co., Ltd., Messrs. J. and E. Hall (the Saurer system), Mors, England, Ltd., the Thames Engineering Company, Ltd., the British Automobile Development Company (Brush), the Motor Car Emporium, Ltd. (Dürkopp and De Dion), Messrs. Scott, Stirling and Co., Ltd., Messrs. Straker and Squire, Ltd. Bodies for motor-buses and delivery vans are shown by Christopher Dodson, Ltd., Westminster, and Messrs. J. Liversidge and Son, Ltd.

The Darracq-Serpellet Omnibus Company, Ltd., show several models of the Darracq-Serpellet steam chassis of 20-25-h.p. and 30-40-h.p. suitable for delivery vans and motor-buses. An interesting exhibit is the 30-40-h.p. demonstration vehicle built for the Emigration Dept. of the Canadian Government, of which an illustration is given elsewhere in the present issue. Much interest is centred on the stand of the Daimler Motor Company, Ltd., where is shown a complete Renard road train consisting of a locomotor, two passenger coaches and a luggage van, reference to which was made in a recent issue.

New combination petrol-electric motor chassis, suitable for motor-buses and delivery vans, are displayed by Messrs. Greenwood and Batley Ltd., Leeds, Messrs. Straker and Squire, Ltd., and Messrs. W. A. Stevens, Ltd., Maidstone. In the Greenwood and Batley vehicle a 35-h.p. four-cylinder engine drives a continuous current dynamo. In the rear of the latter are two series wound motors, each driving through distinct enclosed cardan shafts and worm gearing one half of the rear live axle. In the Straker-Squire 'bus the engine, which is of 30-h.p., is coupled direct to a dynamo which generates energy at varying amperage and voltage, this being utilised to operate two electric motors geared to a counter-shaft, whence the power is transmitted to the rear road wheels by silent

The 24-30-h.p. Churchill Char-a-banc recently supplied by Messrs Durham Churchill and Co. to the Caledonian Railway, for service between Eaglesham and Cathcart.

The journey is only about four miles, but it is an exceedingly difficult one. Notwithstanding this the car successfully went through a month's trial without an involuntary stop, and without missing a scheduled trip.

chains. In the Stevens system the engine is directly coupled up to a special dynamo which has two windings so arranged that they can be coupled up either in series or in parallel. In line with the dynamo is the electric motor which drives the rear axle through a cardan shaft and bevel gear. The principal feature is found in the controller, which is so coupled up with a pedal that its position cannot be changed unless the pedal is depressed, which breaks the circuit as well as slowing down the speed of the engine by acting on the throttle, which latter is also controlled by a lever on the steering wheel. We hope to refer to the Stevens system more fully in a later issue.

Passing now to heavy petrol commercial vehicles, the well-known Orion lorries are being kept well to the front by Messrs. Moss and Woodd, who are showing a standard 3-ton wagon fitted with 20-h.p. horizontal double-cylinder engine. In addition to a Decauville van and lorry, Messrs. H. M. Hobson, Ltd., show a 30-h.p. Hobson heavy lorry fitted with the Jenatzy patent suspension. The invention consists mainly in mounting the mechanical part of the vehicle as a whole upon a second frame, entirely independent of the vehicle frame, and suspended from the latter by special springs, so that the absorption of vibrations and shocks no longer depends upon the load which the vehicle is carrying. Messrs. Argylls, Ltd., and Argylls London, Ltd., exhibit a new 16-20-h.p. 30-cwt. lorry chassis with the engine located under the driver's seat and a worm drive in place of the usual bevel gear, several light vans, a newspaper delivery van as built for the "Glasgow Evening News," a 10-12-h.p. sample carrier, and an Argyll 14-16-h.p. standard cab. A novelty is seen at the stand of the Enfield Autocar Company, Ltd., in a

20-h.p. vehicle specially designed for the conveyance of horses. The Simms Manufacturing Company, Ltd., exhibit a number of commercial vehicles ranging from a neat 20 cwt. van to a 28-35-h.p. 5-ton lorry built for the Great Central Railway. Heavy petrol vans and lorries are also displayed by Messrs. James and Browne, Ltd., the new Arrol-Johnston Car Company, Ltd., Commercial Cars, Ltd., Luton, Messrs. Scott, Stirling, and Co., Ltd., Halley's Industrial Motors, Ltd., Glasgow, and Messrs. Straker and Squire, Ltd.

Light petrol motor delivery vans for loads of from 7 to 30 cwt. are exhibited by the Lindsay Motor Manufacturing Company, Ltd.; the Horley Motor Company, Horley; Sturmeys Motors, Ltd., Coventry; Belsize Motors, Ltd., Manchester; Messrs. Glover Bros., Ltd.; Messrs. Moss England, Ltd.; Messrs. West, Ltd.; Messrs. De Dion-Bouton, Ltd.; Messrs. Alldays and Onions; the Adams Manufacturing Company, Ltd.; the Lancaster Motor Garage; Messrs. W. T. Clifford Earp, Ltd.; and Messrs. J. A. Lawton and Co. The Star Engineering Company, Ltd., Wolverhampton, have on view a neat 14-h.p. van for loads up to 15 cwt.; a Star 10-h.p. four-cylinder landaulet and a 25 cwt. van were also expected. A novelty is seen in the new vehicles—a 15 cwt. delivery van, a handsome cab, and a six-seated cab—shown by the Pullcar Motor Company, Ltd., Preston. The engine and driving gear are so connected with the front pair of road wheels as to form a two-wheel tractor or *avant train* which can be applied to ordinary carriage bodies. An illustrated notice of the system was given in the *M.C.J.* of July 28th last. Two useful petrol motor delivery vans are shown by the Industrial Motor Company, Windsor. The 9-h.p. vehicle has a capacity of 10 cwt., while the 12-h.p. machine is intended to convey loads up to 20 cwt. at a speed of twelve miles per hour. A novelty to this country is the 14-16-h.p. petrol delivery van exhibited by Messrs. Jesse Ellis and Co., it being fitted with the Fonillaron variable speed gear obtained by expanding and contracting pulleys; the system was described in connection with our report of the

The Argyll 16-20-h.p. 30 cwt. Lorry with detachable canvas canopy. —

recent Paris *Salon*. The Motor Engine and Manufacturing Company, Ltd., show a couple of chassis suitable for delivery vans, the feature lying in the engine, which is of the Duplex two stroke type, of which an illustration was given in these pages two or three months ago. The Laere Motor Car Company, Ltd., make a feature of the Laere 16-h.p. vans, the chassis of which are built by the Albion Motor Car Company, Ltd. Interest in the display is increased by the presence of the first chassis of the kind in England, which has covered a distance of close on 30,000 miles and is still in excellent running order. A novel and useful tradesmen's carrier is exhibited by the Autocar and Accessories Company, Ltd., of South Norwood; it is a three-wheeled machine fitted with a 5-h.p. air-cooled engine, and is capable of carrying loads up to about 4 cwt.

Messrs. Mann and Overtons, Ltd., exhibit a 10-12-h.p. Unic motor-cab, similar to those which are now largely being used in London. Messrs. West, Ltd., show a 10-12-h.p. West-Aster with single-landaulet body, specially designed for public service. Other exhibitors of motor-cabs include the Adams Manufacturing Co., Ltd. New Leader Motors, Ltd., Nottingham, are present with a new 10-12-h.p. four-cylinder cab, the engine of which is placed near the driver's seat somewhat as in the Lanchester, the usual bonnet being thus dispensed with. A useful 10-12-h.p. 10-cwt. van is also on view.

Messrs. Barford and Perkins, Peterborough, show two sizes of their petrol motor rollers, while Messrs. Ransomes, Simms and Jeffries, Ltd., Ipswich, in addition to a range of their well-known motor lawn mowers, exhibit a series of the Orwell petrol engines from 2½-h.p. to 12-h.p. they are now turning out.

As regards electrical vehicles, the Electromobile Company, Ltd., exhibit a motor ambulance built for the City of London Corporation and a 15-cwt. delivery van. The Electric Van, Wagon and Omnibus Co., Ltd., in addition to the Electrobus, show a 5-cwt. delivery van and a 20-cwt. covered wagon.

Messrs. Drummond Bros., Ltd., have an interesting display of their special lathes for the repair of motors, as well as a small bench shaping machine, and an assortment of lathe chucks and accessories. Other exhibitors of machine tools include Messrs. Ludwig Loewe and Co., Messrs. Selig, Sonnenthal and Co., Messrs. Richard Melhuish, Ltd., Messrs. Burton, Griffiths and Co., and Messrs. Alfred Herbert, Ltd.,

Coventry. The Kirkstall Forge Company exhibit steel frames for motor-buses and delivery vans, and also draw attention to their special axles and hubs, made in accordance with the Butler patents.

A new paraffin carburettor known as the Cottrell is shown by Paraffin Carburettors, Ltd., Birmingham. The device, which is provided with a two-way cock, so that the engine, when first put into operation, may be started on petrol; comprises a special form of expanding and contracting choke tube around the spraying nozzle. The fuel is first partly vaporised and mixed with air, the mixture being afterwards heated ere passing into the explosion chambers by means of the exhaust gases, which, before passing away, are circulated round the inlet pipe.

Good types of motorists' raiment are exhibited by Messrs. H. J. Nicoll and Co., Ltd., whose rainproof frieze motor coats are well known, and by Messrs. Samuel Bros.; Messrs. A. W. Gamage, Ltd., have their usual comprehensive selection of clothing and accessories, the latter including horns, accumulators, speed indicators, &c., as well as tools, lamps and syrens.

Artillery wheels and bent timber for motor bodies constitute the display of Messrs. Smith, Parfrey and Co., who also show the Clincher "Grid" rubber tyre. Tangent Wheels, Ltd., have also a large assortment of their specialities.

The Stern-Sonneborn Oil Company have a complete selection of their oils; the Fieldline lubricating oils and varnishes are on the stand of Messrs. J. C. and J. Field, Ltd.; varnishes and paints constitute the display of Messrs. Docker Bros., Ltd., and Price's Patent Candle Company, Ltd., are represented by their lubricants for cars, gear-boxes and chains as well as preservatives for leather-faced clutches and the like. The "Shell" motor spirit is kept before the notice of motorists by the General Petroleum Company, Ltd.; and the Anglo-American Oil Company, Ltd., have samples of motor spirits and oils for heavy vehicles; the Vacuum Oil Company have their familiar assortment of lubricating oils and greases.

Messrs. Brampton Bros., Ltd., have a selection of driving chains and sprockets for commercial vehicles. The most attractive exhibition of the chain makers at this show, however, is that made by Messrs. Hans Renold, Ltd., who show their roller and silent chains in motion. This latter type is now being largely employed in London bus work to the satisfaction of police authorities and engineers alike. The Coventry Chain Company, Ltd., keeps its productions to the fore, showing a selection of chains and chain wheels for commercial vehicles.

Miscellaneous tools and accessories are on view on the stand of the American Importing Company, who show the "Auto Cle"—a handy combination for cars or garages. Messrs. Ross, Courtney and Co., Ltd., have a varied exhibit of their lubricators, oil pumps, motor tyre pumps, the "Ross Courtney" valve and other specialities. The "Fastnut" washer, recently illustrated in our columns, is exhibited by Messrs. Fastnut, Ltd.

The "New Era" petrol fire extinguisher is shown by the Valor Company, Ltd. Messrs. Brown and Barlow, Ltd., exhibit their carburettors, and Messrs. Salisbury and Son, Ltd., have a representative collection of the "Salisbury Dietz" lamps and other high grade productions for lighting the way of heavy automobiles. Messrs. W. H. Willcox and Co., Ltd., have a collection of their pumps, lubricators, jacks, gauges, &c., as well as head lamps and lubricants for motor lorries.

Tyres are a fairly comprehensive section of the show, their leading specialities being shown by the Swinehart Tyre and Rubber Company; Messrs. J. Liversidge and Son, Ltd. (the "De Nevers" tyre for commercial vehicles); the Shrewsbury and Challiner Tyre Company, Ltd.; the Peter Union Tyre Company (who show a number of tyres that have done long service); the Gaulois Tyres, Ltd.; the Dunlop Rubber Company, Ltd.; and the Sirdar Rubber Company, Ltd. Non-skids naturally constitute the feature of the display made by the Parsons Non-skid Company, Ltd., whose Grippa non-skids and Sparklet inflators are well known. The adjoining stand is occupied by Messrs. Harvey Frost and Co., Ltd., who are constantly introducing new features in their appliances. The New Motor and General Rubber Company, Ltd., make a bold display of their "Rub-metal" non-skids and draw attention to their facilities for tyre repair work generally. In addition to their usual show of speedometers, mileage recorders, watches, &c., Messrs. S. Smith and Son, Ltd., have a new taximeter. The Cowey patent extension speed indicator fitted with a dial for the dashboard and another for the convenience of the passengers is exhibited by the Cowey Engineering Company. Electrical specialities of wide range are on the stands of Messrs. Peto and Radford, Ltd., and also of Marconi's Wireless Telegraph Company, Ltd. The Doherty Motor Components, Ltd., have their usual display of components and fittings, including radiators, lubricators, bonnets, &c., for heavy vehicles, motor-buses, &c. Machine cut gears are shown by Messrs. David Brown and Sons, Ltd. Messrs. John Marston, Ltd., make a special display of radiators for motor-buses. The "Bentall" motor is on the stand of Messrs. E. H. Bentall and Co.

The Car and General Insurance Corporation, Ltd., take advantage of the occasion to make known their facilities for insurances to meet the requirements of recent legislation.

RECENT deliveries of special vehicles have included a 30-h.p. Siddeley chassis to the Birmingham Fire Brigade.

MESSRS. JACQUES AND COMPANY, of Duke Street, Dublin, are the local agents for the Chambers car.

CASES UNDER THE MOTOR-CAR ACT.

At Barnley, recently, Seth Stephenson, Crigglestone, has been fined 20s. and costs for leaving his motor-wagon ten minutes unattended on the high road, at Worsbro' Dale.

A motorist has been fined 10s. and costs for driving a motor-car to the common danger in Battersea Park.

At the Arundel County Bench, on Monday, five motorists were summoned for exceeding the legal limit, a conviction being recorded in each case. In the afternoon three other cases with similar results were heard by the borough magistrate.

NO REAR LIGHT.

A point of importance to motorists was raised at the Manchester County Police Court on Monday. The defendant was a man named Olson, in the employ of a motor-car manufacturing firm in Manchester. He was summoned for driving a motor-car along the Chorley Road, at Swinton, on the evening of the 22nd ult., without having a rear light. From the evidence given by two police-constables it appeared that the defendant was stopped at Swinton at 11.15 p.m. He was being towed by another car, because the car he was in had broken down at Lowton St. Mary's, and was being taken to Manchester for repairs. There was no rear light on either of the cars, the officers said. Mr. McKeever, barrister, contended that there was no case, and quoted a part of Section 11 of the Motor Car Act. The car was not a motor-car, because the engine was not working, therefore the defendant was not liable, as he was in the rear car and was being towed in the direction of Manchester by another car for repairs. It was fastened by means of a rope. There was a rear light when the car started, but it was very difficult to keep it in owing to the jerks from the other car and the fact that it was on a very rough road. The Chairman: The case is dismissed.

ROAD REPORTS.

BURNLEY.—The Surveyor to the Burnley Rural District Council calls the attention of that authority to "the menace to expenditure" caused by the increasing number of motor-wagons and trailers. The mischief they do in ordinary travelling is, he says, in crushing the under metal, and thus destroying the life of what would, under ordinary traffic, prove excellent material. In his opinion the width of all wheels ought to be wider than at present prescribed, whether for vehicles drawn by horses, or locomotives, or motor wagons.

EAST SUSSEX.—Several roads are under repair in the Chorley district. The steam roller belonging to the Uckfield District Council is working in the parish of Waldron. Ambrose Hill, Bolney, is to be rolled at the end of this week.

PERTSHIRE.—At the quarterly meeting of the Highland District Committee of Perthshire County Council the District Road Surveyor submitted his annual report, in which he regretted to state that the roads within the district were only in fair order during last season. The main lines of road are becoming worn with the increasing traffic by motor-cars and motor-wagons, and as that traffic would go on increasing the metal allocated is insufficient for their proper maintenance. The Surveyor suggested the application of 4,100 yards of extra metal as being necessary, the estimated cost of which was £1,600. The Estimates Committee reported that they did not recommend that the additional metal suggested by the Surveyor should be applied at present. The majority of the motor-cars making use of the district roads were not local cars, but belonged to non-residents who contributed nothing towards the road rates of the district. The Estimate Committee's recommendations were adopted unanimously.

SUSSEX.—The roads under repair in Sussex include Stane Street, between Pulborough and Watersfield; the parish of Waldron; on the Arundel to Brighton road, between the Coach and Horses, Clapham, and the north-west corner of Broadwater Green; and that part of the Worthing-Littlehampton road west of Goring Crossways.

YORKSHIRE.—The committee of the North Yorkshire A.C. have from time to time taken steps to improve roads for motor traffic, and have now in hand the question of improving several sharp and dangerous corners. They have also been instrumental in getting various warning posts erected where required.

OXFORD.—The authorities will not during the next few weeks be doing anything beyond the ordinary road repairs in Oxford, consequently the main roads will not be much disturbed.

YARMOUTH.—No road repairs are in progress at Yarmouth which cannot be rolled in and got into shape so as to be safe and easy travelling at five hours' notice. The authorities, however, are unfortunately laying two miles of tramway track on the main road out of this resort, on the north; it will not be completed for six weeks, and during that time the traffic over it must be regulated at a slow pace, owing to only one track being able to be left open for vehicular traffic. Mr. J. W. Cockwill, the Borough Surveyor, is always anxious to facilitate the movement of any extra traffic likely to be brought into the town.

MID SUSSEX.—In the Mid Sussex district there has been a watch kept on the road experiments—tar binding, tar painting, and the calcium chloride process—recently made. The winter has been a very severe test, and the verdict is apparently in favour of the first. It is dustless and mudless. The process undoubtedly prolongs the life of the road material and reduces scavenging to a minimum. Tar painting comes next in good results, and has proved a better dust than mud preventive.

LANCASHIRE.—The treacherous Heaming's Brow, between Dunsop Bridge and Newton, is to be altered. The hill comes on an acute bend of the road, and its steepness is certainly not made less dangerous by the loose slag of the road and by the brook at the foot of the hill. Motorists will be glad to hear that some improvement is likely to be effected.

ISLE OF MAN.—The Peel Road in Douglas is in a very bad way, and the country roads on the Isle of Man generally are said to be in a deplorable condition. Unrolled stones seem the great feature of the highways, with the result that local motorists can scarcely understand the refusal of the offer of a steam roller to the authorities some time ago.

WINCHESTER.—The city council discussed the result of dust-laying experiments carried out by their direction. The city surveyor found calcium chloride effective, but he was anxious to try tar-painting, by means of the latest appliances. His own belief was that the ultimate solution of the dust problem would be an entirely altered method of constructing roads generally.

PUBLIC MOTOR SERVICES.

THE directors of the Star Omnibus Company, Ltd., regret that extensions of the London County Council tramways, tube railways and the competition of the new motor-omnibus companies have seriously reduced the receipts of the company's omnibuses, and the result of the year's trading therefore does not permit of the payment of the preference dividend. Twenty-six motor-chassis have been delivered,

The 16-h.p. Reo Light Delivery Van can be easily transformed into a comfortable touring car, seating five passengers. Not only that, but the tonneau is detachable from the rest of the body, so that the vehicle can be used as a two-seater only, if required.

but great difficulty has been experienced in maintaining these, and so far it has been impossible to work them at a profit.

EPITOMISING the legal aspect of the public motor services, Mr. J. H. Moore said at the meeting of the London Road Car Company, that under the provisions of the Metropolitan Police Carriage Act, 1869, one of the principal Secretaries of State might from time to time licence to ply for hire within the limits of the Act hackney and stage carriages on such conditions as the Secretary of State might from time to time prescribe. In 1871, 1893, and again 1897, orders were made in pursuance of the Act by the Home Secretaries of the day which were perfectly reasonable, but a further series of conditions had just come into force, several of the provisions of which were somewhat onerous to the proprietors.

A MOTOR-BUS service is contemplated between Lee Green and Oxford Circus, London.

A MOTOR service is about to be established between Easdale and Oban by the Kintyre Motor Company, Ltd.

THE directors of the Great North of Scotland Railway have arranged to put on a daily service of motor-omnibuses between Newburgh and Aberdeen, commencing on April 1st.

A SUB-COMMITTEE of the Kensington Borough Council has been appointed to obtain the opinion of counsel and to take such steps as may appear necessary to bring about a mitigation of the "motor-bus nuisance" in the borough.

IN the King's Bench, on Monday, Agnes Smith, Maidstone, was awarded £170 damages against the London and District Motor Omnibus Company, Ltd., proprietors of the Arrow Line of motor-omnibuses. Plaintiff was ascending to the roof of an omnibus when her hand was crushed by another car, alleged to belong to the defendants, who, however, denied all knowledge of such an accident.

AUTO-CYCLE CLUB'S SILENCER TRIALS.

THE final tests of the various silencers entered for this trial have now been held. The judges, Colonel H. C. L. Holden, Messrs. J. Lyon Sampson, M.I.M.E., and B. Chatterton, A.M.I.C.E., after carefully examining all the competing silencers, and taking into consideration such important points as back pressure, noise, facility of attachment, weight and strength, capacity, means of cleaning and maintenance, and cost, have recommended that certificates be awarded as follows—First, Sharpe's "Universal" silencer; second, Sharpe's "Universal Victoria" silencer; third, Sharpe's "Universal Paragon" silencer; fourth, Collier's "Matchless" silencer; fifth, Montgomery's "Montgomery" silencer; sixth, Aldington's "Silent" silencer; seventh, McAuslane's "Wat-not" silencer; eighth, Aldington's "Combined Footrest, Footwarmer and Silencer"; ninth, Wood's "Radio" silencer.

COMPANY NEWS.

NEW COMPANIES REGISTERED.

VEHICLE WHEELS.—£1,000. First directors: Messrs. G. A. Howlett, D. A. Prust, and F. J. Briebach. 16, Holloway Road, N.

CHARLESWORTH BODIES.—Registered with a capital of £2,000. To carry on the business of makers and sellers of bodies for motor-cars, carriages, wagons, and vehicles of all kinds, &c. The subscribers are C. Steane, Mrs. F. J. Steane, J. W. Cotton, C. K. Steane, Mrs. L. M. G. Hill, E. G. Davis, and F. Steane.

W. ACTON AND CO.—£2,000. To hire, manufacture, equip, and maintain motors, vehicles and boats, &c. First directors: Messrs. T. W. Acton and L. Porro. 15, Market Place, Acton, W.

MAUDSLAY MOTOR COMPANY (1907).—£100,000. To acquire the business of the Maudslay Motor Company, Ltd. (incorporated in 1903), carried on at Parkside, Coventry, and at 213-223, Knightsbridge, London. First directors: Sir Charles S. Forbes, Bart., Messrs. A. Craig, F. E. Foster, C. C. Maudslay, S. Sanders, and J. W. C. Seymour. Parkside, Coventry.

BERESFORD RIM COMPANY.—£5,000.—To acquire from Mr. R. Beresford the benefit of an invention relating to improvements in wheel rims for inflated tyres. First directors: Messrs. S. W. Carryer, H. E. Emery, R. Beresford, A. A. Pattison, S. Colclough, R. Edwards, and A. Bayley.

RECKLESS DRIVING.

AT York, four drivers of motor-cars have been summoned for driving at a dangerous speed in Clifton, Bootham, or Museum Street, on various dates in the past month. In the cases of Arthur Ellis, chauffeur to Sir J. Grant Lawson, Bart., York; Harold Horseley, mechanical engineer, York; and Frederick W. Keighley, chauffeur in the service of Messrs. George and Jopling, Darlington, the magistrates did not consider the speed excessive, and dismissed the summonses. The other defendant, Henry W. Kirkaldy, engineer, was fined 20s. and the costs. In Keighley's case it was stated that when he was stopped by the police whilst driving Mr. W. F. West, Sutton Bank, Scarborough, down Slifton on a trial run, he said he was not going at a greater speed than fifteen miles an hour. Mr. West, called for the defence, said he did not think the speed was greater than twelve to fourteen miles an hour, and it was submitted that there was no danger as there was no one about to be endangered. Alderman Wragge said the Bench did not consider the speed excessive, and he suggested it would be advisable that constables should not assume a disguise, as the witnesses in that case did.

POLICE TRAPS.

THE police have again been active in Loampit Vale, Lewisham.

A POLICE trap has been established in the Shooter's Hill road, the victims of which have to attend the police court at Woolwich.

MOTORISTS going Brighton way should beware of the police trap at Southwick.

THE business of "police traps" for motorists has again revived in the Crawley district over the old measured distances, viz., from the county boundary of Surrey and Sussex on the London side, two miles from the level crossing at Crawley, and from half a mile on the Brighton side. Over this distance the police had a trap working on Sunday last. It is worked by two plain clothes men who wave their handkerchiefs to the man in uniform to stop them.

MOTORISTS visiting Brighton and the district should remember that police traps abound in every direction, especially on the Shoreham roads and towards Chichester.

MOTOR-CAR ACCIDENT.

As the result of an accident, through being knocked down by a motor-bicycle in the Eastbourne Old Town, an old lady has died at the local Hospital. An inquest was held on Thursday week at the Hospital by the East Sussex coroner, when the jury returned a verdict of "Accidental death," and exonerated the motor-cyclist from all blame. A juryman remarked upon the dangerous state of Church Street when vans were standing outside shops.

BUSINESS NEWS.

FROM Messrs. Jarrott and Letts comes a very artistically-produced catalogue of the 1907 models of De Dietrich cars. It also contains a number of illustrations showing various types of carriage bodies which can be mounted on De Dietrich chassis. In addition there is a list of De Dietrich successes since 1900, and an interesting description of the Lorraine De Dietrich Company since its foundation two centuries ago.

IN view of the sporting instincts displayed by motorists generally, and the interest taken in any racing event, the invitation which Mr. Weigel is extending to all motorists at the present time will doubtless appeal to many, especially those who are anxious to see England holding its own against the other motor-producing countries on the Continent. As is by now well known, Weigel Motors, Ltd., are the only English firm which has entered for the A.C.F. Grand Prix race. Contrary to the usual custom of secrecy which is so prevalent in such matters, Mr. Weigel is inviting all those who take an interest in racing events to visit the works at 90, Goswell Road, London, E.C., to see the construction of the two eight-cylinder racing cars they are building for the event.

THE H.F. Garage Vulcanizing Equipment, a new apparatus brought out by Messrs. Harvey Frost and Company, combines the H.F. "Car" vulcanizer with a vulcanizer of similar pattern, so that by means of the joint and simultaneous use of both appliances defects in the interior and exterior can be treated at the same time. The heat in each steam generator can be regulated independently, so that a lower degree of heat can be applied to one side of the tyre than the other side, or vice versa. Each section of the apparatus is distinct and self-contained, and either one section or both may be carried on the car if necessary. The apparatus has a special stand provided, with adjustable cramps, which admit of the two vulcanizers being moved to any angle.

THOSE who have reason to fear that their cars are used at times without their sanction or by unauthorized persons should bear in mind that the use of a mile recorder may help them to test the truth of their suspicions if a reading be taken regularly and entered in a book kept for the purpose. Besides this, a mileage recorder affords a valuable means of judging the wearing qualities of the car or any part thereof. Among the latest introductions in this line is the Bowden Mileage Recorder, just brought out and enabling the dial to be placed anywhere in or upon the car without the use of a flexible shaft.

AT an extraordinary general meeting of the Rexer Arms Company, Ltd., on Tuesday, Sir T. H. Holdich said they proposed to acquire the Metallurgique car works, at Charleroi, and extend them with a view to raising the output to 500 chassis per annum. They were also acquiring a steam-car, made in Paris under patents obtained by Messrs. Friedmann and Knoller, of Vienna, and with these extensions in view the capital of the Rexer Company, Ltd.—as the company will in future be known—is to be increased to £205,000.

THE motor flexibility competition, organised by the Crystal Palace A.C. for the 23rd inst., is intended to "decide the respective merits of flexibility between two, four, six, and eight cylinder motor-cars." Every car which starts from the Crystal Palace, including the initial start on its speed, and which remains on the top speed throughout the test, will be awarded 1,000 marks. For every gear change ten marks will be deducted, and a further deduction of one mark will be made for every five seconds that any gear other than the top is used. The cars will journey to Bexhill, where trials will be held on the track, commencing at 1:30 p.m.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case; otherwise no liability will be accepted.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

The Chairman of the Royal Automobile Club.

MR. C. D. ROSE, M.P., is the fourth chairman of the Royal Automobile Club. First was Mr. Roger Wallace, M.P., whose untiring efforts gave strength to the movement when it was centred in Whitehall Court; then came Col. H. C. L. Holden, the head of the Royal Gun Factory at Woolwich, whose term of office was marked by further developments in the direction of encouraging the makers to perfect their vehicles; and the third chairman was Mr. Arthur Stanley, M.P., whose tactful speeches at many gatherings of motorists, no less than his wise handling of Club affairs, did much to prepare the way for the Royal recognition he recently announced at the annual dinner. He is succeeded by Mr. C. D. Rose, whose motoring enthusiasm has been seen at various meets and competitions, and whose interest in automobilism is of long standing. Mr. Rose is a keen supporter of sport generally. He has been a member of the Jockey Club for more than a decade, and is famous as a tennis player and as a yachtsman. Since 1903 he has represented the Newmarket Division of Cambridgeshire, and, sitting on the Government side of the House, should be able to influence any legislation which may be suggested with regard to Motorism. The new chairman of the Royal Automobile Club, to whom we wish a pleasant and useful term of office, is a son of Sir John Rose, a whilom Prime Minister of Canada, and an "old boy" of Rugby.

Eyesight.

SEVERAL sections of the community have lately been discussing the question of eyesight as it affects the drivers of automobiles, and, as our columns have recently testified, the matter has been receiving the consideration of medical men. From thence to the Press was the first stage; after which its grave discussion by local authorities seems the natural course of things. This is the way of this particular problem, and the fact that the Norfolk County Council has been suggesting that no motor-driver should be licensed whose eyesight is defective should be regarded by those concerned as but indicating a general feeling that is growing in many circles. As the number of motor-cars in our streets increases there is every reason to believe this desire for alert drivers able to easily discern objects in dull lights will strengthen until the exercise of more stringent regulations will make the licensing of drivers a standard of physical fitness as well as mechanical efficiency.

"Load" or "Car."

MANY enquiries are made as to what should, or should not, be included in the weight of a motor-car for the purpose of registration or taxation. The detachable Cape cart hood presents the most frequent difficulty, as this fitting, being somewhat heavy, may easily, if included, bring the weight of a car to over a ton, and thus render it liable to two guineas more taxation than would otherwise be required. The Secretary of the Local Government Board, to whom the Automobile Association have referred the point, states that the Board has no authority to

determine the meaning of the expression "weight," but he draws attention to a passage in the regulations which appears decisive. This reads:—"The expression 'weight' when applied to a motor-car or trailer does not in itself determine what can be regarded as part of the vehicle, and what can be regarded as part of the load; and it appears to the Board that whilst any essential part of the vehicle or its mechanism is clearly included in calculating the unladen weight, the circumstances of construction may, in certain cases, permit of a *detachable framework* or body being treated as part of the load, rather than of the car itself." The term "detachable framework" should certainly cover a Cape cart hood.

Road Tracks.

At the inaugural dinner of the recently-formed Stratford-on-Avon and District Motor-Cycle Club, held on Friday of last week, the President (Mr. A. W. Jackson) in the chair, Mr. T. Birch, in responding to the toast of the evening, referred to the question of road improvements as affecting motorists throughout the country. He said they would have noticed on their runs that there were large pieces of waste land on the roadside of many of the highways, once used for tracks for horsemen at exercise. These, however, were seldom used now, and he thought that if that dirt were cleared away and the track made as wide as the boundary line would permit, road-users would have more space. The expense would not be great, as the land could be ploughed up on a level with the highway, and the farmer whose land adjoined would only be too pleased, he thought, to cart the soil on to his farm, and thus save the ratepayers the expense.

Agricultural Hall Extension.

WHEN the proposed additions are made to the Agricultural Hall this building will, says the "Daily Chronicle," rank with the largest exhibition buildings in the world. The improvement involves the sweeping away of Swanley Street, Islington, and an extension of Barford Street. Swanley Street contains more than a score of houses, including a block in the centre. No doubt the disappearance of the street will constitute an improvement in itself. In an interview with an official of the company a representative of our contemporary learned that the proposal is to extend the present minor hall to a size equal to half that of the great hall. The extension will add 150 feet to the length. The building will be of stone and brick, while the roof will have three iron and glass spans, supported on six iron columns. A main entrance to the minor hall will be in Barford Street, while there will be several emergency exits in St. John's Place and Barford Street. The probable cost of the improvement will be about £30,000.

The Manners of Chauffeurs.

ALTHOUGH it is not the first time we have sought to impress upon our readers the necessity of keeping a strict watch over their cars, we would emphasise the need for motorists to take care that their chauffeurs do not regard the automobile as a plaything for spare hours. Many of the accidents that have occurred to the detriment of the motor movement have taken

B

place when drivers have made unwarrantable use of their employers' vehicles. At the North London Police Court a chauffeur has been summoned for negligently driving a motor-car. The evidence was that the prisoner took his mistress to Euston, and then picked up some friends and drove towards Crouch Hill. At the junction of two roads a bus and a tramcar were in his way. He drove across on to his wrong side and collided with a horse and four-wheeled cab, knocking everything over and injuring the driver. The police alleged that the motor driver was drunk, and the divisional surgeon certified to that effect, but the prisoner denied it. The magistrate commented on the fact that the defendant did not know either the names or addresses of his passengers, and Mr. Fordham hoped it was not usual for chauffeurs thus to use their master's property. He also said that chauffeurs appeared to think they could drive which side of the road they liked, instead of waiting to take their turn in the ordinary line of traffic. Motor-cars were most comfortable and convenient if properly used; but, if improperly used, they were most dangerous. Such incidents as these, trivial in themselves, often repeated, do much to discredit a movement that must always keep on good terms with the public generally.

Mr. Lewis Waller, the well-known actor, on his 30-h.p. Daimler Car.

Work for Provincial Clubs.

IN many parts of the country a fair proportion of the roadway has been lost owing to the neglect of the authorities, and the point raised on the previous page is of concern in certain districts. The question is brought forward at an opportune time, when the occurrence of a few fine days has led people to think of open air delights, in which, of course, Motorism has a first place. The widening of road tracks, and the frequent trimming of hedges, so that the view of the road is not unduly obstructed, are problems of real importance, and provincial clubs should each take stock of the conditions of their districts in this direction, with a view to rendering all the area possibly available free for the use of those who travel on the King's highway.

Road Improvements.

THE annual report of the Roads Improvement Association, which has just been issued, indicates a revival of interest in the proceedings of this useful and, in fact, necessary organisation. Its operations have not yet been limited to any one district, but all the way from Battersea to Carmarthenshire it has endeavoured to secure the interest of responsible officials in improving the condition of the surfaces of the highway. Special attention has been given to thoroughfares in London, and arrangements are being made for a deputation to

the Highways Committee of the L.C.C. protesting against the erection of central standards in important streets. The aggregate membership of the association (which includes all members of organisations subscribing to its fund), now amounts to 120,000; and the National Dustless Roads Committee, which has just been formed under its auspices, promises an experiment of considerable national value. The first work of this new committee, we understand, will be to lay various dustless road materials in half-mile sections along a continuous length of main road. The life of the various materials will subsequently be ascertained and compared with a standard macadam road. In this way it is hoped to prove conclusively that the adoption of satisfactory dustless road materials will not only be feasible, but will reduce the cost of road maintenance, and consequently the highway rate.

The Size of Catalogues.

TAKEN in conjunction with the paper on Works' Organisation, read by Mr. Percy Martin in London last week, a suggestion from Mr. Mervyn O'Gorman with reference to the size of catalogues comes at an opportune time. This proposes a reform in the office, and is termed by its author—whose characteristic vein finds full vent in his excellent Motor Pocket Book, the new edition of which has just been published by Messrs. A. Constable and Co., Ltd.—an attempt "to defraud the waste paper basket." Recognising the want of uniformity in the size of the catalogues issued in connection with the motor trade, Mr. O'Gorman proposes that these should be standardised, the size known as quarto, about 10 in. by 8 in., being regarded as the most convenient form. On behalf of the idea it is said that there need be little difficulty in convincing everybody of the value of the notion; the catalogues could be easily kept in their place, the cost of printing—it is suggested by the author—would be diminished, and the adaptation of some system of indexing would be easy. Much is to be said on behalf of the plan; but, as a general rule, business firms require their lists to be "out of the ordinary," and the institution of unusual sizes, as well as getting away from the commonplace, is regarded as one of the essentials of modern advertising. That is an aspect of the matter that may produce some difficulties to serve as a barrier to the realisation of Mr. O'Gorman's suggestive proposition.

The Professional Driver.

ORGANISATIONS of motorists have hitherto been chiefly confined to the owners, designers, and manufacturers of cars, fees and subscriptions being generally prohibitive to the professional driver. True, one or two attempts to enrol this large class into some kind of society have been made, but they have been unattended with great success, and it has remained for the Motor Union to take his unorganised state into consideration. This will shortly be dealt with by that organisation, which should aim at developing an *esprit de corps* among the drivers of cars and provide opportunities for improvement in the technics of their business. Something may then be done to weed out those who have no pride or interest in driving, for without the exercise of intelligence no really satisfactory results can be secured.

Our Readers.

THERE are "circulations" and "circulations." The strength of the *M.C.J.* in the matter of small advertisements is proof of the character of its readers. People do not advertise cars to sell unless they know such announcements are read by likely buyers; they do not advertise for situations without knowing that the journal is studied by those who employ men, and there is no doubt that the motorist is a reader of advertisements. That is always the case with comparatively new industries, and we would take this opportunity of emphasising the fact that sellers as well as buyers of cars and

employers of men recognize the value of the *M.C.J.* in filling their requirements.

Water Rates.

THE Motor Union is contributing towards the legal expenses of a case which raises a question of interest to medical men using motor-cars throughout the country, viz., whether they are to be charged a water rate, as in the case of business vehicles, when they use their cars partly for professional purposes. The case was taken up at the instance of the Harrogate Automobile Club on behalf of one of their members who is also a member of the Motor Union. The member was sued at the Knaresborough Petty Sessions by the Harrogate Corporation for the recovery of 10s., being a half-year's rate levied in respect of water for his car, which he refused to pay. Mr. J. E. A. Titley, the local solicitor for the Union, submitted that the Corporation could not possibly, under the Act, ask defendant to pay for [water for washing his car for "trade" purposes, that

carriage mechanically propelled which shall be presented for licensing on and after August 1st, 1907, shall be fitted either with an approved taximeter to indicate to the hirer the fare chargeable, or with an approved distance recorder to indicate to the hirer the distance travelled; and any hackney carriage may, from the date of this Order (March 15th), if the proprietor so wishes, be fitted with an approved taximeter or distance recorder." Fares payable for the hiring of a motor hackney carriage fitted with a taximeter will be according to the following scale:—

	s.	d.
Not exceeding one mile, or for a period of time, or a journey not exceeding ten minutes	...	0 8
Exceeding one mile or ten minutes:		
(1) For each quarter of a mile, or for a period of time, or a journey not exceeding two and a half minutes	0	2
(2) For any less period or distance	...	0 2

In addition to the above, the motor driver is entitled to extra charges for luggage and extra persons as in the case of the horse cabdriver.

AN AUTOMOBILE GMYKHANA IN EGYPT.

Under the patronage of the Khedive, the Automobile Club of Egypt held a Gmykhana on the Egyptian Trotting Ground at Choubra, near Cairo, on the 8th inst. The programme comprised a glass of water race, driving between swinging balloons and also between skittles. Our illustration shows a car competing in the last-named event.

being the provision of the Act under which he was charged. The Bench adopted this view, and also decided against the contention of the Town Clerk that there was an implied contract because the defendant had paid on two previous occasions. The Bench agreed, at the request of the Town Clerk, to state a case for the opinion of the High Court, and the Motor Union is assisting its member in order that the decision of the Justices may be sustained.

Motor-Cab Regulations.

THE revised text of the draft order issued by the Home Secretary on January 22nd, relating to the licensing of hackney carriages and motor-cabs, and the use of taximeters in both kinds of vehicles, has now been issued, and contains several alterations on the original draft. The principal passage of the revised order is as follows:—"Every hackney

Motor Lifeboats.

WRITING from a neighbourly position facing the offices of the Royal National Lifeboat Institution, we are naturally interested in the fortunes of that association, whose good work has seen fresh evidence during recent storms. Even more than that, too, is the fact that latterly some important experiments have been undertaken with regard to motor lifeboats, and it is hoped that at no distant date it may be possible to place several efficient motor lifeboats on the coast. At the end of last year the institution's fleet comprised 273 sailing and pulling lifeboats, four steam lifeboats, three motor lifeboats, and one steam tug, and on those propelled by mechanical power great hopes are centred. Reference was made to these by Lord Londonderry at the annual meeting on Monday. In moving the adoption of the report he spoke in terms of commendation of the care taken in the building of new

lifeboats to ensure that they should be of a type suitable for the districts in which they had to work. As regarded the experiments which had been made with motor lifeboats, it would naturally occur to the uninitiated that a motor engine, being dependent on petrol, might very well find itself deprived of its power of motion by heavy seas swamping the engine, but he was assured that in the course of the experiments the lifeboats had been turned over without such a mishap occurring.

One Advertisement —147 Replies.

MAJOR MATSON has been relating some personal experiences for the encouragement of individuals who are starting with a motor-car, and who may be afraid of some difficulty in obtaining a driver. He writes in the "Daily Mail" as follows:—"I always employ a youth to attend to my small wants, which are mainly in the direction of repairing tyres, cleaning the car, and driving as occasion offers. My present boy, however, desiring to leave to better himself, having now come to nearly man's estate, I advertised in the *M.C.J.* for a smart youth capable of driving a car of a certain make; to this I received over sixty replies." Such experience is not exceptional. We have just had a letter from Mr. Arthur Martell, of Llanarmon, N. Wales, who says:—"I am writing to let you know the wonderful results of a single advertisement in your paper. Last week I advertised for a driver; by this (Tuesday) morning I have had 147 replies." This is a fair specimen from our correspondence every week, and although it is contrary to our practice to sound our own praises, we have pleasure in thanking Major Matson for thus relating his experience.

The Season.

THE coming of a few fine days—alternated in truly British fashion with tearful clouds and muddy roads—has given a slight impetus to the season, which will really open with the beginning of the Cordingley Show in a fortnight's time. Evidence of this movement in the automobile business is also supplied in a report from the Royal Automobile Club to the effect that "there is now a very brisk demand for first-class drivers, and applications are being received from members daily." This confirms our own impressions—gleaned from the show-rooms of London firms as well as correspondence from many readers who are interested in the scheme of the Club's Driving Certificate, which has become a kind of passport to employment with motorists who are loyal to the central organisation. "First class" men are wanted on the car; the duffer had better keep away from the steering wheel—a truism which does not seem generally understood amongst all the applicants for situations as chauffeurs, but a fact which they should realise before disappointment dispels their illusions.

The Flying Machine.

JUST now the question of flying is very much in the air—in something more than a visionary sense. Its embodiment in realisable form will be a feature of Cordingley's Motor Exhibition next month, and hardly a journal declines its pages to the problem. In the current "Monthly Review" Mr. Bernard S. Gilbert deals with the coming of the flying machine in an article which adds to the interest of a magazine of already varied contents. Taking his ideas from the bird which "is born with an instinct for balancing" unknown to man, Mr. Gilbert suggests that the successful airship must approximate to its ability to preserve equilibrium in the air, which is "amazingly gusty." But just as he seems to be getting into the practical aspect of the matter the author tantalisingly veers into speculative regions where, guided by meteorology, he pictures airships "starting from and alighting on to specially-prepared platforms, running regularly between fixed stations and long certain tracks, weather permitting." An attempt is made to seriously consider the new highway, and several pages are devoted to an attempt to show the value of

aerial navigation—all of which is an interesting glimpse into a future for which the Aero Club is preparing its members.

The Risks of Motorists.

COMPARED with the people of a century ago, modern folks run many risks that never menaced the lives or pockets of our ancestors. Hence the necessity of insuring against all kinds of contingencies, such as burglary, fire, accident, to say nothing of the dangers incidental to the public highway. To these must be added the claims which the Legislature has imposed upon owners of vehicles and employers of workers, throwing into a state of uncertainty many departments in the insurance business of the country. In such a new industry as that associated with the motor-car all premiums and other arrangements must necessarily be matters of assumption, more or less. Consequently interest attaches to any statistics which serve to indicate the chances of claims being made in connection with the operation of automobiles. Such comes from some returns issued by the Travellers' Insurance Company of the United States, which has a reputation across the Atlantic for its dependable reports and statistics. Of 167 accidents made known to the company and which were other than of a fatal character, sixty-one—practically 37 per cent.—were due to misadventures when starting the engine. This suggests the necessity of inventors continuing their experiments with regard to the self-starting devices of which so much was heard a year or so ago, but which seem to have entered upon a period of quiet. Collisions are responsible for no more accidents than result from the ordinary occupation of working on cars, the proportion being about 17 per cent. in each case. Injuries received while entering or leaving cars accounted for another 7 per cent., while burst tyres added 3 per cent. to the total. Too much emphasis need not be placed upon such returns, but they have their warning to drivers when starting vehicles and their hint to inventors to lessen the risks incidental to Motorism.

UP to Saturday night the 40-h.p. Siddeley car, now on its long distance trial, had completed a run of 4,222 miles.

MESSRS. SHIPPEY BROTHERS inform us that they have been appointed agents for the sale of Morgan and Wright's side-wire motor-bus tyres.

THE trial of Mr. B. Atkinson, of Leeds, for manslaughter has been concluded at Leeds Assizes. This arose out of a motor-car accident in August last. After a three days' hearing the jury were unable to agree and were discharged.

THE demand for the modern type of motor-cars for sale at the Motor House, 366-368, Euston Road, N.W., is the feature of the auctions of that establishment, which holds a chartered accountant's certificate proving that they have sold as many as 78 vehicles in eight days.

ON Tuesday twelve of the cars entered for the Vapour Emission Competition of the R.A.C. underwent the first portion of the test. This took place in the Club garage in Down Street, Piccadilly, W., the vehicles having to stand on an incline of about one in seven for ten minutes in each direction with the engine running at normal speed. A road test of 150 miles took place on Wednesday.

ONE of our representatives who has had occasion to use several kinds of lubricating oil on his 3-h.p. Triumph motor-cycle, has found that of Messrs. A. H. Dawson and Company, Cathedral Street, Manchester, eminently satisfactory. He finds he uses considerably less than with many other brands, which seems to point to the fact that the high quality of this oil has considerably more lubricating properties than others on the market.

ON Tuesday next Mr. Archibald Ford, of Liverpool, will commence business on his own account in Liverpool and Manchester, premises having been acquired at 293, Deansgate, in the latter city, where a branch of the British School of Motoring, which Mr. Ford is founding, will be established. His company will be known as Archibald Ford, Ltd., and will absorb the business of Motor Tyres, lately carried on in Bold Street, Liverpool. A garage will also be established in South Castle Street, Liverpool.

LADIES AND MOTORING.

HERE is no way that the motor-car exemplifies in a more marked degree the popularity and perfection to which it has arrived than in the fact that ladies, who seldom have any idea of mechanics or are fitted temperamentally to find the study an easy one, can, in a comparatively short time, become skilful and successful drivers. This has been proved most conclusively during the past year or so, for the cars now owned and operated by ladies are many. A short time ago a woman driving a motor-car was regarded as a curiosity, but it is no extraordinary sight at the present time and creates scarcely passing attention, as the number of lady drivers has so largely increased. Motor-ing has, from its earliest advent, proved a most fascinating pastime for the fair sex, and they are coming to understand more fully the mechanical features of the car, and are learning more of its capabilities and necessities.

The coming of the car has opened up new possibilities; the flexibility of speed, the exhilaration without physical exertion, and the distance that can be travelled, all conduce to the greatest

indicative of trouble, before it seriously affects the working of the vehicle. She must learn to regulate the speed and power of the engine according to the roads being travelled, and at all times have complete control of her car. A break down on the road will prove a most effective lesson, although a disagreeable one, but the really successful lady motorist is the one who makes a complete study of her car, and guards as far as possible against troubles arising when driving. On a country road, inconveniently far from expert aid, she is wholly dependent on her mechanical knowledge to avoid delays, which are now fortunately very rare, and which, when they do occur, are in the majority of cases caused by quite simple troubles which could be easily overcome. When the motor stops on the road one of two things is most likely to be the cause, either the proper supply of fuel is lacking, or the means for igniting the mixture have gone wrong. In the first instance the trouble is probably in the carburettor or with the fuel supply, in the second case it is the ignition system that requires attention. If, previous to the stop, there were weak explosions or a great deal of smoke in the exhaust, the indications are carburettor troubles. If

The Baroness de Reuter at the wheel of her 12-14-h.p. Argyll Car.

fascination, and, whether one has been a lover of the horse or an enthusiastic cyclist, there is nothing to equal the motor-car if speed combined with a maximum of comfort is a desideratum. The lady who desires to develop into a successful driver must be possessed of cool and steady nerves; she must have a level head, courage and determination, must be ever ready and calculative and quick of application should an emergency arise where instant action would be necessary. She who considers herself an expert motorist, because she can handle the steering wheel and understands the operation of the different levers, has only accomplished the rudimentary part and has much to learn. She can never be too well informed regarding the car she drives, and should become thoroughly conversant with the intricacies of the motor and familiarise herself with its working features. The preliminary instructions would be learning to steer the car, the use of the throttle and ignition levers, the change-speed lever and the clutch pedal, and the immediate action of these parts upon the engine.

The lady motorist should educate her ear to the normal sound of the engine, and thus become able to discover, amid the humming of gears and throbbing of the motor, any wrong note

missing of the explosions takes place, the cause is probably to be found in the ignition system, although both missing, and explosions in the silencer are also sometimes due to a poor mixture. One case of ignition trouble is a short-circuited plug. If a certain cylinder is missing fire and the plug has been examined and cleaned and seems to spark well when the car is running on the level or down-hill, but refuses to do duty when a hill is reached, it is an almost certain sign that the plug in that particular cylinder is short-circuiting, either from dirt or oil on the inside, or perhaps because it is cracked; the remedy is to change the plug for a new one. Soot on the surface of plugs often short-circuits them, permitting the current to pass through without forcing it to leap the spark-gap. Another thing that causes chagrin to the lady driver is, remarks Mrs. A. Sherman Hitchcock, in an American contemporary, to have the motor stop, because the ignition is advanced too far while the motor is carrying a heavy load. Experiments with both the throttle and the ignition levers in different positions should be made until the best results under all conditions are obtained. The beginner is also very much humiliated to find the reason the car refuses to go is because the brakes are on! It

is something very apt to occur with the novice, so that one should be careful to see that the brakes are off before attempting to start the car. Another important thing to observe is that the ignition lever is always set back before starting the engine. The beginner is very apt to suffer a sprained wrist, if not worse, from back-fire, unless this lesson is well learned. One of the most important elements in proper care is attention to lubrication. A sufficient amount of oil must be fed uninterruptedly to all parts of the engine. If the oil supply gives out the piston will seize and a wait for the engine to cool is inevitable, while oil must be procured. If the petrol supply gives out the car is at a complete standstill until more can be obtained. Without water the engine will become overheated, resulting in the cylinders being scored, which means great damage to the engine. The careful driver will try to avoid this happening and will take prompt measures to overcome any symptoms of overheating. It is always advisable for the beginner to practice with the brakes and learn to estimate distances and speed as accurately as possible. Before driving a car through a busy thoroughfare it should always be under complete control. To thoroughly understand road rules is also something which is highly important. If a lady has been accustomed to driving any vehicle she will be familiar with the rules

LIGHTS ON VEHICLES.

MORE than a score of years ago enthusiastic cyclists urged that all vehicles using the roadways after dark should be provided with lights warning other users of the roads of their coming. Such a proposal seemed reasonable enough, but the difficulty of securing Parliamentary attention to such an apparently minor matter prevented the proposal being adopted. The advent of the motor-car, however, revived the agitation, and all who travel in country places are aware of the dangers associated with stationary carts or slowly moving vehicles on the road. Recent legislation required that automobiles should be lighted not only in front, but also at the rear. Apparently the idea of the Legislature was that danger lurked only in the rapidly moving vehicles; whereas the presence of slower ones constitutes as great a menace to other users of the roadway.

At length, however, there is a prospect of uniformity being obtained—in England and Wales at first, in other parts of the United Kingdom ultimately. On Friday of last week Major Renton, M.P. for the Gainsborough Division of Lincolnshire, persuaded the House of Commons to unanimously approve of

COMMERCIAL MOTOR VEHICLES AT RIPLEY.

A run of commercial vehicles from London to Ripley and back, organised by Mr. Leo Harris, of John Marston, Limited, took place on the 10th inst. Our illustration is reproduced from a photograph taken at Ripley; among the vehicles which took part in the excursion were three Argylls—a 16-20-h.p. two-ton van, a 10-12-h.p. light delivery van, and a 14-16-h.p. cab—a Fiat 'bus, a Maudslay 'bus, a Ryknield 'bus, and a Dennis 2½ ton van.

of the road and if not she must familiarize herself with them. The fact that she is a woman is no reasonable excuse for ignorance of road regulations, which sometimes results most disastrously; and, as a driver of a motor-car, she should expect no preferences or privileges other than those enjoyed by all.

Ladies have no other outdoor pursuit that can compare with motoring; it is the means of keeping them in the open air, taking them out into the country, and the results manifest themselves in a healthful mental and physical equipoise and pleasure. Good health, youthfulness and an unequalled exhilaration can be found with the aid of the motor-car. The number of ladies driving their own car will greatly increase each year as they realise more and more the fascination of actually driving. While the study of mechanics is a new one to almost every lady, still a proper understanding of any unfamiliar subject can be gained by systematic work in accordance with a desire to become proficient, and the lady who has aspirations to become a successful motorist must apply herself diligently to the study of the petrol motor.

the second reading of his Lights on Vehicles Bill, which seeks to compel all vehicles to carry a light. In view of threatened opposition to the idea of a second light, he only advocated that one should be carried, the main intention being to secure uniformity throughout the country. A conspicuous feature of the debate was the favour given to the measure from all sides of the House—Liberals, Conservatives and Labour members giving it their approval. Mr. Adkins, who is, in a way, the spokesman of the County Councils Association, favoured the measure, though hinting at probable amendments in committee, and Sir Frederick Banbury did not see why it should not be extended to Scotland—an extension that seems reasonable and even necessary. In fact, as Mr. A. Stanley pointed out, it is a ridiculous anomaly that while motor-cars have to carry lights, no such requirement was made in the case of slow moving vehicles.

On behalf of the Government, Mr. Herbert Samuel, the Under Secretary to the Home Office, recognised the great need for one universal regulation in this matter. There was no reason for the local differences which at present existed between one county and another, and if Major Renton's Bill can quickly become law it will do something to lessen the hazards of the highway, and bring order out of chaos in one department of local government.

THE GRAND DUKE OF OLDENBURG has lately acquired a 35-40-h.p. Horch car with limousine body.

THE CADILLAC 26-30-h.p. CAR.

As mentioned in a recent issue, the Anglo-American Motor Car Company have lately introduced into this country a new type of vertical four-cylinder car which the Cadillac Co. are now turning out from their works at Detroit, U.S.A. We had an opportunity of going over the chassis of the new vehicle (Fig. 1) a few days ago, and as in many respects it varies from what may be termed the standard practice, the following particulars may be of interest. In the first place, it may be mentioned that the main frame, which is of channel steel construction, is supported on long and flexible springs, the

Fig. 1.—General View of Cadillac 26-30-h.p. Car.

usual dumb irons at the rear being replaced by halves of semi-elliptic inverted springs. The engine (Fig. 2), which is supported on a subsidiary frame of steel tubing, comprises four separate cylinders, $4\frac{3}{4}$ in. bore by 5 in. stroke. The cylinder heads containing the valve chambers and combustion chambers are cast separately, and attached by a right-and-left threaded nipple. The water jackets are of copper, and of a construction that is original with the Cadillac Co. These fit tightly over a slightly roughened and tapered flange, cast integrally with the cylinder. Round the outside of this is pressed downward a steel ring about two-thousandth inch small, which makes a tight fit and allows the jacket to be quickly removed. The crank shaft bearings are made in halves, so that they can be removed

Fig. 2.—Part Sectional View of Cadillac Four-cylinder Motor.

without the necessity of disturbing the shaft. A large inspection door is provided on one side of the base chamber, to give access to the big ends of the connecting rods.

As the valves are mechanically operated and interchangeable; they are located on one side, a single cam shaft being used. Provision is made for adjusting the lift of the valves by means of split nuts on the lower ends of the valve stems. The tappets consist of square blocks carrying hardened steel wheels, and

moving in cast iron guides held to the crank case by six studs. The mixture is furnished by a special form of carburettor, provided with an automatic air inlet, the float chamber being ingeniously arranged so that it surrounds the spraying jet. The ignition is by coil and accumulators, the contact maker being set horizontally on a vertical spindle driven by bevel

Fig. 3.—Details of Cadillac Automatic Governor.

gear off the cam shaft. The water circulation is maintained by a gear-driven pump and a framed tubular radiator with air-inducing fan. The gear wheels operating the cam shaft and the water-circulating pump are entirely enclosed. A duplex arrangement of silencer is provided, there being two chambers, 30 in. long by 6 in. diameter, set parallel with the side members of the frame. The exhaust, which has a free passage, there being no baffle plates, has to pass through both of these ere emerging into the atmosphere.

A feature of the car which is new is the application of the

Fig. 4.—Section of Clutch and Change-speed Gear on Cadillac Car.

ring type of marine governor to automobiles. Fig. 3 gives a view of the governor, with part of the aluminium casing removed. The vertical shaft A, which runs on ball bearings, is driven by bevel gearing off the cam shaft. The ring B is supported on one side and normally rests in an oblique plane, but when the speed of the engine increases it tends to assume a position in a horizontal plane. This action is opposed by the spring C fastened to the collar E, which the ring moves upward

by the connecting link D. As the collar E moves upward it carries with it the bell crank lever F, which in turn pulls the rod G and closes the throttle lever on the wheel. When the latter is set for open throttle it pulls the rod H, which in turn operates the bell crank lever J to lower the collar under the ring B and increase the tension on the spring C, which means that a greater engine speed is necessary to make the ring overcome this increased tension. By this arrangement it is possible to set the throttle lever so that the engine will maintain, within the limits of its power, practically the same speed up hill or down. If it is desired to suddenly increase the speed, a foot accelerator

Fig. 5.—Part Sectional View of Rear Axle.

just to the left of the clutch pedal can be depressed; this opens the throttle wide and to a certain extent pulls the rod G to depress the governor ring; when the accelerator is released the engine immediately resumes the speed permitted by the throttle lever above the steering wheel.

The base chamber, which is of aluminium, is divided into four compartments, the dividing walls of which also act as supports for the crank shaft bearings. The lubrication of the motor is accomplished on the splash system, the oil being fed to one end of the base chamber by a mechanical lubricator operated by an arm, motion to which is imparted by one of the valve push rods. From the lubricator the oil flows upwards through a sight feed on the curved steel dashboard to the rear compartment of the crank case. By splash it is thrown into a sloping trough on the side wall, and drains into the next forward compartment, where it again goes through the same performance,

Fig. 6.—Details of Brakes on Cadillac Car.

and so on until it drains into the oil compartment at the front, whence the surplus flows back to the rear and is again used.

Although the car is driven through a planetary type of change-speed gear, and could be operated without a main clutch, one has been provided, for the reason that it is often desirable to run the engine with the transmission entirely idle. In Fig. 4 K is the flywheel bolted to the flange M on the crank shaft, and supporting the ball bearing N. L is a large split washer or ring set into a groove in a similar manner to the retaining ring of a

ball bearing. It is forced outward into its groove by having a taper screw plug inserted at the place where it is split. In the hollow thus formed is the clutch, composed of two circular leather-faced discs O and P, which are forced away from each other and against the inner surface of the flywheel on one side and the ring L on the other, by eight short coiled springs between the discs. The clutch is released by bringing the plates O and P together by means of two ball bearing collars R and S. At the back of these collars, where they bear against each other, are wedge-shaped surfaces, so that by rotating them in opposite directions they are forced apart, and as R is fast to the sleeve T, which in turn is fast to plate P, such separation of the collars brings P and O together. Vertical rods connected to a short cross-arm on the cross-shaft on which the clutch pedal is mounted rotate the collars R and S in opposite directions. Three forward speeds and a reverse are provided by a change-speed gear of the planetary type. It is mounted on ball bearings and runs in oil. All the gear wheels are made of steel and are fitted with bronze bushes. It is divided into three drums A B and C, with the usual contracting leather-faced steel bands for the two forward and the reverse speeds, and with a high speed disc faced with leather and rotated by the engine shaft, by means of a cross-arm with lugs at its ends which fit into notches or slots in the back of the disc. When this disc is forced against the outside of the transmission by a mechanism similar to the clutch, the entire gear is fixed to the clutch shaft, and all parts turn together with the shaft, the gear wheels inside being stationary on their studs but rotating with the studs around the shaft. This gives a direct drive on the high speed through a cardan shaft and bevel gear to the rear live axle, which has only the driving

Fig. 7.—Part Sectional View of Front Axle.

effort to transmit, the weight of the car being taken by the sleeve. The road wheels, which run on ball bearings mounted on the sleeve, are keyed on to the tapered ends of the live axle.

There are two sets of brakes, one actuated by pedal and the other by a hand lever (Fig. 6); both act on drums connected with the rear road wheels, one set expanding inside the drums and the other contracting on the outside of the same, both being so connected up to the clutch that the latter is withdrawn when the brakes are applied. The steering gear is of the screw and nut type; it is provided with ball thrust bearings, and provision is made for taking up any wear. The front axle is built of steel tubing, while it may be added that the steering wheels each revolve upon two ball bearings, the large set being in line with the spokes. The chassis, which is adapted to receive any type of side-entrance body, has a wheel base of 8 ft. 6 in., the track being 4 ft. 8½ in.

At a recent meeting of the Society of Chemical Industry a paper was read by Mr. Philip Schideowitz, Ph.D., and Mr. Frederick Kaye, A.R.C.Sc., on "The Chemical Composition of some Motor Tyre Rubbers." In concluding their remarks the authors stated that "whatever views may be entertained regarding the quality of the rubber, vulcanisation and mineral matter, in regard to the composition of pneumatic tyre covers, it is plain from the results obtained by us that manufacturers are by no means agreed on these points and that nothing approaching to finality in this very difficult question has yet been reached. Finally we think we are justified in saying, as an inference from our results, that where failures occur a chemical examination of the rubber employed may be distinctly useful."

SOME USEFUL NOTES.

A GOOD way to clean a badly-sooted plug on the road is to wipe it first to get the worst off, then attach it to a piece of wire and lower it into the petrol tank and bathe it.

IN case of petrol becoming accidentally ignited, it is useless to try to extinguish the flame by means of water, as the spirit will float on it and continue to burn. Dry sand is very effective as an extinguisher, and a supply should be kept constantly on hand where petrol is stored or used.

THE water in acetylene lamps is best preserved from freezing by dissolving calcium chloride in it. But if this precaution is not taken and the water is frozen, a little saliva on the carbide will produce enough gas to light it and thaw the water, and so allow a permanent light to be obtained.

A LARGE number of modern carburettors have hot-air jackets round the mixing chamber. This is a part which is frequently overlooked. It is a very easy matter for both it and the pipe from the exhaust to get choked, this being particularly liable to happen when the engine is over-lubricated. Needless to say, the carburettor will then give very poor results.

A CAUSE of lack of power which is frequently overlooked is a stopped or partially-stopped exhaust box. When the exhaust box can easily be taken to pieces the remedy is obvious, but when it cannot be dismantled without unriveting, the best plan is to keep a gas blow-pipe playing fairly hard into the box. This will burn and loosen any deposit, which can easily be washed out.

THE secret of a smooth-running motor is "synchronism." All the inlet valves should open and close at the same point in the stroke of their respective cylinders, as should the exhaust valves. This applies with equal force to the ignition. Since most camshafts are now made solid and pinned to their respective gear wheels, all that is necessary to secure synchronism is to see that the clearance between the valve stems and their push rods is the same in all cases.

A MOTOR which is suffering from poor compression may serve fairly well at high speeds, as the duration of the compression period is so brief that not a very large part of the charge is able to escape, but when the engine is slowed down almost to the labouring point, as when climbing a steep hill on the high gear, the effects of imperfectly maintained compression quickly make themselves manifest. Under such conditions a longer time elapses between the commencement of the compression stroke and the ignition of the charge, and also between ignition and exhaust, with the result that when the maximum power of the engine is desired it is falling off rapidly.

It may happen that a motor which has given long and faithful service is for one reason or another taken apart for overhauling and again put together. If it lacks power when taken into use under such circumstances, it is probable that some mistake has been made in the mounting, and especially that the valve gear has not been put together exactly as it was before. Unless the pinion on the motor shaft is marked at the tooth which engages the spur wheel on the cam shaft, and two teeth on the latter, one on each side of the pinion tooth, are similarly marked, a small mistake is liable to be made, and would result in too early or too late opening and closing of the exhaust valve. In whichever direction the error is made, the loss of power will be considerable, even if it does not prevent starting of the motor. Few engines offer any easy means for remedying such an error without taking the engine apart again, and the precaution of marking the two spur wheels should, therefore, always be observed when a motor is taken down.

THE COVENTRY SIMPLEX MOTORS.

WE illustrate herewith a new 16-h.p. petrol four-cylinder engine which has been put on the market by the Coventry Simplex Engines, Ltd., of East Street, Coventry. It has been designed by Mr. R. N. Stroyer, one of the members of the firm, and, as will be seen, the cylinders, which are $3\frac{1}{2}$ in. bore by $3\frac{1}{2}$ in. stroke, are cast in pairs with ample water space round the valves and combustion heads, while, in order to secure good castings, the water jackets are provided with large covers. The pistons are light castings, with three rings of the hammered type, ensuring uniform springing at all points of the circumference. The gudgeon pins, which are hardened and ground to fit the phosphor bronze bushes of the connecting rods, are secured to the pistons by a novel and positive method. The steel connecting rods are of H section, and are lined with anti-friction metal at the big ends. The crank shaft is a solid forging of special 45-ton tensile steel, and is supported by three substantial ball bearings, a separate compound thrust bearing being provided to take the clutch thrust, whichever way it may act; it terminates in a cone for coupling to the flywheel. The aluminium crank chamber, which is so arranged that the bottom half can be dropped without disturbing the crank shaft, is

provided with overflow taps to regulate the height of the lubricating oil. The lubrication of the different parts is well provided for, the connecting rod caps having scoops for catching the oil, and the small ends of the connecting rod having a well on the top into which the oil is splashed. Besides this provision for oiling, the gudgeon pins are hollow and receive oil from the cylinders, which have separate lubricating pipes attached. The valves are all actuated off a single cam shaft, the latter being so arranged that it can easily be drawn out from one end, the bearings being of such diameter as to allow the cams to pass through. Special attention has been paid by the designer to the sweet engagement of the cams with the rollers, both being of unusually large diameter. The cam shaft gear wheels are enclosed in a separate chamber; this also contains a wheel, which, running at engine speed, can be used for driving the water circulating pump or magneto. The four exhaust branches are connected up to a neat steel exhaust box. The efficiency of the engines is very high, the 16-h.p. four-cylinder developing 19-h.p. at 1,500 r.p.m., while the silent running and extreme flexibility of the motor go to make it a most suitable one for light cars, especially having regard to the fact that it weighs, with pipes, only about 165 lbs. All the parts are interchangeable, jigs and gauges being employed throughout. We may add that a 25-h.p. six-cylinder engine on similar lines is also being made, and that both types will be on view at the forthcoming Cordingley Show.

CONTINENTAL NOTES.

Motoring in Sweden.

Motorists who intend taking their cars to Sweden should procure a certificate from a Swedish Consul in their own country, stating that the car is being taken for touring purposes and that it is constructed according to the regulations. If this certificate be presented to the police authorities in the town in Sweden by which the motorist enters the country, they will issue a driving permit and supply a registered number for the car. The certificate can also be obtained from a British Consul in Sweden, but if no certificate be produced the car has to undergo examination by the authorities, who investigate whether the car is in accordance with the stipulations of the Swedish law. The Customs duty on motor-cars entering Sweden is on the basis of 15 per cent. *ad valorem*. The amount deposited is returned in full on application to the Customs officials at the town or port of entry when the car is leaving the country.

The Race for the Kaiser's Prize.

The accompanying map shows the course which has been definitely decided upon for the forthcoming race in Germany for the Kaiser's prize, and for which ninety-two entries have been received. It is 125 kilometres long, and will have to be covered

four times. The starting point is at Kloster Thron, near Homburg, the principal places passed through being Reichenbach, Emmershausen, Ernsthause, Weilburg, Usingen and Wehrheim.

An Austrian Reliability Trial for Light Cars.

The Austrian Automobile Club is organising a reliability trial for light cars to be held on May 24th, 25th and 26th next. The event will be open for (1) vehicles with single-cylinder motors of a capacity up to $1\frac{1}{2}$ litres, and carrying two persons; (2) ditto, with engines comprising two cylinders, up to $2\frac{1}{2}$ litres capacity, and carrying three persons; and (3) ditto, with four cylinders, total capacity up to 2.6 litres, with accommodation for four persons. The cars must be in proper touring trim, and must be provided with at least two brakes. The total distance to be covered is 715 kilometres, the first day's run being from Vienna to Klagenfurt; the second from Klagenfurt to Gratz; and the third from Gratz back to Vienna. In Class 1 an average speed of 25 kilometres per hour will be required; in Class 2, 28 kilometres; and in Class 3, 30 kilometres.

An "Elastic" Wheel Trial.

As a result of the success of spring and other elastic wheels trial held last year from Paris to Nice and back, the "Auto,"

of Paris, has decided to repeat the event in April next. Some important modifications have, however, been made in the rules, notably the introduction of a clause which provides that all stoppages due to mechanical troubles are to be included in the running time. Apart from the difficulty of correctly ascertaining the time lost through these troubles without having official time-keepers on board the vehicles, it has been urged that the mechanism of the cars themselves may be more liable to cause trouble with spring and resilient wheels than with pneumatic tyres, and it is in order to meet this objection that it has been deemed advisable to include all stoppages due to mechanical troubles in the running time, so that the general performances of the vehicles may be compared with other vehicles fitted with pneumatics. A new method of classifying the cars has also been adopted, the four different categories providing for cars having motors of a maximum of piston area as follows:—(1) 127 square centimetres; (2) 347 square centimetres; (3) 432 square centimetres; and (4) 531 square centimetres. The minimum total weight of the vehicles is fixed according to piston area. As was the case last year, the competing cars will run from Paris to Marseilles and Nice and back in eight stages, the start being fixed for April 15th. At Nice the cars will be on exhibition for a day, while on the following day they will be submitted to a speed trial over the flying kilometre. Entries for the trials are sent to the "Auto," from whom full particulars can be obtained, before April 10th, the entry fee being £8 per car.

Public Services in Bulgaria.

It is announced that a company has just been formed in Varna, with the object of starting public services of motor-cars between that town and Dobritsch, and also between Varna and Baltschik.

The German Motor Volunteer Corps.

The Kaiser has offered a prize to the German Motor Volunteer Corps for a long-distance motor race on the lines of the horse ride held each year in connection with the Army Corps.

Public Services in Germany.

A public motor-car service is about to be established between Gressen, Krofdorf and Gleiberg. It is also proposed to inaugurate a service between Gardelegen and Calvorde.

Miscellaneous Items.

An Automobile Technical Society has just been formed in Vienna.—A public motor-car service for the transport of both passengers and goods is about to be established between Rheims, Queux and Rosnay, France.—The automobile meeting at Nice commenced on Wednesday with the speed trial known as the "Kilometre Bull's Eye."—It is announced that the "Décennale" Automobile Salon in Paris is to be open for twenty days during part of November and December next at the Grand Palais. The exact dates have not yet been announced.—It is reported that Hemery is to drive one of the De Luca-Daimler cars in the Targa Florio race.—It is also stated that Callois, who has hitherto been associated with the Brasier vehicles, will drive a Darracq racer in the Commission Sportive Cup race.—Bad weather has again been experienced by M. Van Marcke, who, on the six-cylinder Hotchkiss on which he is making a tour of France, has during the past week visited Montlucon, Limoges, Cognac, Fontenay-le-Comte, Chateauroux, Vierzon, Tours, and Angers. Altogether he has so far covered about 3,300 miles.

MR. L. M. IDDINGS, the United States Consul-General at Cairo, has informed the Washington Bureau of Manufactures that the number of automobiles in Egypt this winter has greatly increased over those of last year. Machines registered in Cairo now number 234, while last season there were seventy-five, and in Alexandria there are 127, as compared with 120 last season. In Cairo one or two new garages have been built.

A SERIES of trips by pupils is now a feature of the programme of the Motor Academy, of Boundary Road, Holland Park Avenue, W.

ANOTHER chapel, this time of historic interest, is to be converted into a motor garage, such being the latest use for the old Surrey Chapel, in Blackfriars Road, London, S.E., where Rowland Hill and Newman Hall were successive ministers.

THE entries for the Cordingley Motor Show, says the "Motor Trader," are rolling up in fine style, and everything promises well for the success of the exhibition.

MR. JOSEPH BRADFORD, of Glasgow, has been appointed managing director of Argylls (Edinburgh), Ltd., whose depot will shortly be opened in a central position in the city.

It may be stated, and with no exaggeration, remarks the "Indian Motor News," that His Highness the Nizam of Hyderabad has one of the largest—if not the largest—and finest stud of cars of any private owner in the world. His garage at Parah Havali, India, is unequalled for the neatness combined with simplicity and ingeniousness of its arrangements; sixteen large motor houses with double doors, ventilated roofs and convenient inspection pits form one side of a huge quadrangular square, the opposite side of which opens upon the entrance to the palace. To the left are the quarters for the drivers, and

HERE AND THERE.

THE old electricity works at Exeter are being adapted to the purposes of a motor garage by Messrs. Reid and Evans, of 177, St. Sidwells, in that city.

THE fact that the Highways Protection League has declined

to join the National Dustless Roads Committee seems to suggest that they have a stronger antipathy to the motor-car than to the dust which it is alleged to raise.

EXPERIMENTS are being made on the Leeds and Liverpool Canal with regard to the adoption of motor-boats for the conveyance of goods.

MESSRS. RICE AND WISE have a well-equipped motor works and garage in Milton Street, Blackburn. It is fully provided with all descriptions of machinery for repair work.

MESSRS. LAPAUZE AND Co., 8, Cheapside, London, E.C., are placing upon the British market the "Arion" sparking plug—a reliable device of which much is likely to be heard among practical motorists.

THE second of the cycle and motor-car shows in Edinburgh this season was opened in the Waverley Market on Friday, last week. Altogether there are about 100 stands, and although the majority are devoted to cycle exhibits, there is a fair number of motor-cars and cycles on view. The show closes to-day (Saturday).

His Highness the Nizam of Hyderabad's Stud of Motor-Cars.

to the right, several more houses for cars are in course of erection. The centre is occupied by an artificial lake with fountains playing, surrounded by flower beds and shady trees—the whole forming a scene of rare and peaceful picturesqueness. His Highness' stud now numbers some twenty-three cars, his latest acquisitions being six Napier cars, a Fiat, a Brazier, and a 30-55-h.p. Daimler. All the cars are christened with Moguli names, which are painted in English and Arabian characters on a board above the motor-house door. His Highness is fortunate in the possession of a European engineer who has had a wide experience.

THE severity of the weather in Scotland may be appreciated from the fact that on Tuesday, while carrying out its daily schedule, the 40-h.p. Siddeley car under trial by the Royal Automobile Club encountered a snowdrift twenty-five feet deep at the Spital of Glenshee. A gang of 100 men were set to work to clear a road for the car, which eventually got through the pass and reached Braemar.

THE Grove Eastbourne Motor Works and Garage, Ltd., have commenced business as dealers in, and repairers of, motor-cars, and suppliers of all kinds of accessories, at The Arcade, Grove Road, Eastbourne. The premises, which were formerly used as the Central Fire Station, afford ample accommodation to garage at least thirty motor-cars, also sufficient space is provided for the works incident to repairs. The general management of the company is in the hands of Mr. Alfred J. Bessant, with Mr. R. R. James as managing engineer.

At the last meeting of the East Lancashire Motor Cycle Club, Mr. T. Burton read a paper on "Anticipating Trouble," in the course of which he exhibited an instrument, of his own construction and design, for testing sparking plugs under compression; this being, as he pointed out, the only way in which a plug could be thoroughly tested for a "short."

A CAPITAL catalogue has been issued by the Earl's Court Motor Garage Company, Ltd., whose headquarters adjoin Earl's Court Station, W. The firm hold agencies for the 6-cylinder Standard, the Peugeot, and the Clement-Talbot cars—all recognised types of modern vehicles. The company have a special department for the hire of motor-cars for short or lengthened periods, and the tariff which accompanies the list will be of service to private people who intend to try motoring at Easter.

THE Calthorpe Motor Company, Ltd., successors to the Mobile Motor and Engineering Company, Ltd., is the title of the two concerns which will in future be carried on as a joint business, the assets of the latter having been acquired by the former as a going concern. The Calthorpe Company has retained the whole of the staff under the management of Mr. L. Antweiler, and owners of Mobiles will be supplied with spare parts, &c. A speciality will be made of the 16-20-h.p. four-cylinder Calthorpe car, fitted with an Alpha engine. The radiator is the firm's patent type, with revolving fan, the latter being encased inside the radiator, which has annular chambers, doing away completely with the tubes; the pump is gear driven off the two to one shaft.

MR. C. A. ROBERTS is opening a motor garage in the Southampton Road, Chandler's Ford, Hampshire.

THE Royal Insurance Company has issued a Record of Sports—an interesting souvenir of remarkable performances in all branches of pastimes and sports.

THE I.O.M. Motor Co., of Douglas, are building a motor-cycle to compete in the Tourist Trophy Motor Cycle race to be held in the Isle of Man during the summer.

Two of the leading garages in Bristol, viz., that of Messrs. Willway and Son, on the Quay, and that of the Bristol Motor Co., Ltd., 18, Victoria Street, are now open continuously day and night, and also on Sundays.

In order to meet the wishes of their clients, Messrs. F. W. Besant and Co., of Wimborne, Dorset, are now supplying with their Luna inspection pits, when required, an ingenious sliding seat or bench, which, locking itself between any two corrugations in the sides of the pit, can be immediately fixed in any position or at any height.

THE sixteenth edition of the Railway and Commercial Gazetteer of England, Scotland, and Wales comes to hand from Messrs. McCorquodale and Co., Ltd. This is compiled from official sources, and contains a list of every railway station, town, village, hamlet, parish, and place in Great Britain. To all interested in the despatch of goods the volume is of special importance.

A SOMEWHAT novel form of exhaust silencer is being made by M. Bizeul, of Bazas, Gironde. As will be seen from the sketch, it is composed of two metal cases joined by a series of steel tubes through which the exhaust gases are made to circulate, thereby lowering their temperature and permitting them to escape into the atmosphere without noise. The cooling of the gases is

assisted by the large surface of tubing on which air is free to impinge. The apparatus has been tested on a 60-h.p. motor in the laboratory of the A.C.F., and the loss of power at 650 revolutions was only $1\frac{1}{2}$ per cent., and at 800 revolutions 3 per cent., a result which, it is claimed, has never before been obtained.

WE are glad to see that British-built motor-cars are beginning to attract attention in Holland. Looking through the pages of our Dutch contemporary we notice that the Argyll, Humber, Rover, and Starling vehicles are all now represented in the Netherlands.

AT the meeting of the executive committee of the Motor Van, Wagon and Omnibus Users' Association, last week, Mr. Howard Humphreys reported that he had had an interview with Mr. Joynson Hicks with regard to the Cambridgeshire bridges, and that although the Great Eastern Railway had done some repairs to the bridges, the workmen had been withdrawn, and there were still eight or nine bridges closed. The County Council had decided to issue a summons shortly, under Section 65.

THE "New Era" fire extinguishing specialties introduced by the Valor Company, Ltd., of the Valor Works, Rocky Lane, Ashton Cross, Birmingham, are becoming well known to motorists, and their motor-boat petrol fire-extinguisher, specially designed for motor-boats, has been approved by the leading insurance companies. This is made in four sizes and is constructed on the same excellent principle as that intended for cars. The "Tonneau" pattern extinguisher has a capacity of one gallon in a case $10\frac{1}{2}$ in. by $10\frac{1}{2}$ in. by $14\frac{1}{2}$ in. This is capable of throwing a stream of fire-extinguishing chemical for forty to fifty feet, promptly extinguishing burning petrol, thus securing the motorist against risk by fire.

THE Hon. Evelyn Pierrepont, of Nuneaton, has recently acquired a Cadillac car from the Anglo-American Motor Car Company.

THE value of the exports of motor-cars and automobile parts from the United States during January last amounted to £75,299 as against only £59,538 in the first month of 1906.

THE British and Foreign Guide to the Engineering, Steel, and Hardware Trades, published by Messrs. Adolphe Francia, Ltd., is a useful compilation divided into four parts, relating to machinery and materials, electricity, ordnance, ships, &c. The various trades for each section are arranged in the alphabetical order of business—an arrangement facilitating easy reference.

MESSRS. W. AND F. THORN, of Gt. Portland Street, London, W., the well-known motor body builders, have just issued a very useful price list of the 1907 models of the various British and foreign chassis at present on the market. The vehicles are arranged in alphabetical order in accordance with their names, and, in addition to the prices, the wheelbase and other dimensions of the cars are set out in tabular form.

MR. CHAS. JARROTT, who is going to Monaco for the Easter holidays, proposes to make another run through on his 40-h.p. Crossley, and hopes by reducing his stoppages to a minimum to considerably improve upon the time he occupied last year, namely, $37\frac{1}{2}$ hours, without actually increasing the running speed. He is leaving the Automobile Club at 8.30 a.m. to-day (Saturday) crossing over via Folkestone to Boulogne, and anticipates arriving in Monte Carlo the following evening about 7 o'clock.

BEYOND the ordinary standard of commercial lists is the illustrated record of the motor sport events of 1906 issued by the Continental Tyre and Rubber Company. The year was crowded with classic events of a sporting character, and the 120 pages of which this excellent volume consists are filled with really artistic reproductions of photographs depicting the leading scenes and principal participants in the Herkomer Trophy competition and other races where the reliability of the Continental tyre proved a factor of confidence to the driver and of importance in the result.

THE great increase in the motor business of Messrs. A. Deacon and Son, of Llandudno, has led them to secure larger premises in Vaughan Street, which were originally built for a furniture warehouse. They are the largest business premises in the town, the building consisting of three storeys, the upper floors of which will be rendered accessible by the use of an electric lift capable of dealing with the largest touring car. The ground floor will be used partly as a showroom, and also for a garage, while the top floor will be devoted to repairs. Messrs. Deacon and Son will have the place in working order for Easter.

WHO did that? The answer will generally be found in a pocket volume published under the title by Messrs. G. Routledge and Sons, Ltd., and issued in their Miniature Reference Library. The book is egg-full of information, accurate and erudite enough to enable the ordinary man to follow the general press. Under the heading of motors we find motor-cycles, motor fishing boats, motor launches, motor propelled carriage and motor train—the latter referring to the Renard system that is being developed here by the Daimler Company. Why motor-cars and automobiles have not been enumerated we know not.

FROM Messrs. J. Wilson Browne and Son, 34 and 35, Ludgate Hill, Birmingham, comes a price list of their "Orto" motor lamps. These include petroleum side lamps, such as the No. 2 pattern, which is fitted with the firm's specially fluted lens throwing the light for fifty yards, the "carotte" size for tri-cars, a reflecting tail lamp, electric carriage and motor-car lamps and acetylene head lamps. In connection with the latter mention may be made of Messrs. J. Wilson Browne and Son's acetylene generators, in which the generation of the gas is regulated by the pressure contained in the inside cylinder, which in turn forces the water out of the carbide chamber, and immediately the pressure goes down, allowing the water to come in and more gas to be given off. The gas can be turned off instantly, further generation being stopped by the pressure of gas in the inside cylinder.

[Letters to the Editor should be addressed to the office, 27-33, Charing Cross Road, W.C.]

THE FLEXIBILITY COMPETITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In a competition of this nature, about which so much controversy has been elicited, it is, perhaps, only natural to get some objections, but surely the better way would be to enter for the competition, which is quite simple in its character, i.e., journey to Bexhill and back on top gear, slow running test, and speed test on Bexhill track, and the car that reaches nearest to the high ideal which we have set out as necessary to win the competition will, we venture to think, justify its existence.

So far as Mr. Letts' argument in regard to the advantage that a car with three speeds would have over one with four, this advantage exists entirely in the imagination, as my committee have already had before them this very point, and ruled that the entrant can nominate any particular speed on his car as the top, and, providing he never runs on a higher gear, then it is for the purpose of this competition his top speed. The other speeds would, of course, have to be properly locked to the satisfaction of my committee, so that they could not be used and unfair advantage taken.

I agree with Mr. Letts that there are many other points not provided for in my club's flexibility competition, that could well be thrown open for competition, but for one day my committee felt that the competition in question would give an interesting day's sport and lead to some valuable knowledge.

I thank Mr. Letts for his suggestion about a petrol consumption test, and I think this is excellent, and I shall recommend my committee to hold one at the earliest possible date.

In regard to Mr. Govan's letter, first, the method that will insure standard gears being used is the fact that if too low a gear is used the car will lose marks on the speed test, and if too high a gear is used it will lose marks on the slow test.

2. His statement that speed is the predominating factor for securing marks is incorrect, because 1,000 marks are given for a non-stop run to Bexhill and back on top gear; no question of speed enters into this, 250 only for speed, the maximum to be earned, and 250 for slowest possible running.

The other portion of Mr. Govan's letter refers to some challenge of which I have no knowledge, and has nothing to do with my club's competition.—Yours truly,

HENRY HOLLANDS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having noticed a letter by an eminent six-cylinder exponent commenting upon the Crystal Palace Motor Flexibility Competition, to be held on March 23rd, I should like to call attention to some obvious omissions in the rules.

1. Some method should be found to make it certain that only standard gears shall be used.

2. As speed is the predominating factor for securing marks, it is more than obvious that the horse-power of the vehicle should be taken into account.

With these two palpable defects in the rules, the competition cannot in any way throw any light on the vexed question of four v. six cylinders. In the challenge that I threw out to all six-cylinder manufacturers, quick acceleration up to twenty miles per hour was the only element introduced which had relation to horse-power, and I suggest that this should be introduced instead of maximum speed.—Yours truly,

ALEC. GOVAN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I quite agree with the criticism by Mr. Letts, in the last issue of the *M.C.J.*, with regard to the projected flexibility trial. I, for one, certainly do not see any reason for it, except it be to act as a further boom to popularise six-cylinder vehicles, whose main advantage, as Mr. Hutton recently pointed out, is that they are fine things to go slow on. There may be a few motorists and motor drivers to whom the occasional necessity of having to change gear is irksome, but I do not believe the majority look upon it in this light. The result is that manufacturers, in catering for the few, are producing cars with engines of greater and greater power, and far beyond what is really necessary, in order that all the running shall be done on the top gear. The advantages of the direct drive are unquestionably so marked that this method of transmitting power will be retained, but this does not indicate that all other speed ratios are superfluous. It is possible with a much smaller engine than ordinarily used to travel at a fair rate of speed and negotiate all the hills usually met with in the course of a day's travel, and that without an undue use of the change gear lever. In fact, I

have known of cases of cars, while climbing a hill laboriously on the top speed, being easily passed by other machines on "third," with the engine running somewhat faster, but, nevertheless, working under much more economical and satisfactory conditions.—Yours truly,
T. FRASER.

DRIVERS' LIABILITY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—If a professional driver takes a motor-car from the premises of his employer, acting under instructions, and one of the family subsequently drives, what is the position of the regular chauffeur? The employer's relative may hold a licence and still be an incompetent driver, and the professional driver unable to advise, owing to the difference in social stations. Supposing, when on this journey, a summons resulted; could the professional driver be proceeded against for allowing an incompetent person to take the wheel of the car?—Yours truly,

R. W.

[The summons would, of course, fall upon the person actually driving.]

A WASH ON THE CHEAP.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am enclosing herewith a photograph taken under somewhat exceptional circumstances, at Southport, on Sunday last. The car was being driven round the Marine Drive in a perfect gale of wind, in consequence of which the tide was unusually high. On turning the bend at the corner of the drive, to pass under the pier bridge, the car suddenly swerved to the right, the combined results of a nasty side-slip

and the tremendous force of wind it was just turning to encounter, and, instead of following the asphalted track, it ran straight down the abrupt slope into the sea. The photograph was taken while the car was undergoing what may be termed as a "wash on the cheap"—until the bill for repairs is presented. It was some considerable time afterwards that the car was dragged ashore, and finally taken into tow by another car. The Marine Drive was practically impassable for motorists the whole of the day, and several cars which essayed the passage were compelled to turn back, or suffer a similar catastrophe.—Yours truly,

R. WOODHEAD.

WIRE OR WOODEN WHEELS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice a point that seems to escape discussion on the question of wire or wooden wheels; that is, that, in the case of the latter, while under side stress, one or perhaps two spokes have to bear the weight, and also retard the side stress, which means that once the weight is over the centre of the spoke and the side stress continues, down goes the wheel. In the wire wheel, instead of one or two spokes being in compression, several spokes, perhaps a dozen, are under tension horizontally, maintaining the circle of the rim and supporting the weight, while the vertical spokes rebut the side stress. Moreover, you can true up a wire wheel easily, but some wooden wheels, especially those bearing the chain sprocket, have a knack of getting out of true, and I, for one, cannot true them again.

I much appreciated "Ten Years a Motorist's" letter on the subject of accessibility. Why cannot cars be made on the principle of the contractor's tip wagon? With all the asserted accessibility there still appears that horrible bolt in the flywheel which has to be removed before the bottom half of the crank chamber can be taken away. Makers

tell you they can dismantle cylinders in miraculous time. It sometimes takes me half an hour to get one nut off, and some valves require herculean efforts and very ingenious devices to induce them to come out, on account of their "disputed inaccessibility." The grade of a vehicle is, in my opinion, verified by the amount of attention paid to detail, and the ability of those details to be removed singly, and replaced easily, without pulling the car to pieces.—Yours truly,

HERBERT J. CHAPMAN.

MOTOR CAR LEGISLATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Now that it seems generally recognised that we shall be spared further motor-car legislation for another year, there seems a tendency for the central motor organisations to rest content with the good work they have already done and leave the initiation of other efforts to the local clubs directly in touch with their own M.P.'s and other persons of influence. This is, to my mind, a great mistake; and it is about time that a definite plan of campaign was propounded declaring

SUBSTITUTES FOR THE HORN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "J. H. H." on page 1,137 of your issue of February 23rd, he appears to think that I suggested that he had only tried a cheap class of electric horn. I did not state this and did not even suggest it. What I did say, however, was that "he condemns the whole principle of electric horns to this particular sample which he has used, and that he does not recommend it on this basis," and that is precisely what "J. H. H." is doing. He tries this particular type of horn for one week and then for a further few days, when he states that he gave it up. I cannot say that I can commend "J. H. H." on his persistency. Still that is beside the point. Without dealing with my own particular experience of the "Wagner" electric horn, I have numerous friends and acquaintances who are also using the "Wagner" horn, and in no instance have they had a similar experience or anything near the experience of "J. H. H."

The whole thing evidently hinges round the old question of care and attention. It is a similar tale which you hear on many sides, I cannot

A Shooting Party in Java.—Herr Faubel, of Soerabaija, on his 20-h.p. Reo Car.

[De Auto.]

(1) against the speed limit, whether by order of Mr. Burns or the Rural Council of Liliput; (2) insisting that local authorities should fulfil all their duties with regard to road maintenance; (3) declining to pay any higher taxation than now, on the ground that we are fostering an idea which means a considerable accession of national prosperity, as the export figures published by you last week amply prove. These are a trio of points upon which we should insist, and insist upon with a vigour that shall demand attention.—Yours truly,

A NORTHERN MOTORIST.

[There is a proverb, "Let sleeping dogs lie," and it seems a sufficient answer to our somewhat impatient correspondent. Time is on the side of the motorists, and if legislation can be postponed until they are even more numerous than now, it is likely to be more favourable to their cause than if hurried along at the demands of opponents. There is a fairly general feeling of contentment among motorists with regard to the future, and to give undue prominence to the three points raised by "A Northern Motorist" would not be found very helpful to the Motor Union in its endeavours to conciliate, if it cannot convert, the non-motoring public.]

get this to go right, and that is always going wrong, and in ninety-nine cases out of a hundred you can invariably trace it to lack of a little care.—Yours truly,

S. J. WATSON.

ARE LEATHER-FACED CONE CLUTCHES DOOMED?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I see in your issue of March 9th a letter from Mr. C. H. Mower, on the question of leather v. metal clutches, in which he advocates an epicyclic gear instead of sliding spurs, and thus appears to abolish both types of clutch. Of course, no such thing is the case, as in the Adams gear there are three clutches, which take the form of fibre-faced brake bands. These are no more satisfactory—and I daresay no less, save that there are three clutches instead of one—than the ordinary leather-faced clutch. At I take exception to in his letter, however, is his manifest ignorance of gear changing with properly designed sliding gears and a plate clutch. I am quite sure he can never have ridden in a car so equipped, or he would not, in common honesty, condemn the type

wholesale as "nerve racking," "clash" type gears. I should like to show him that such a thing is commercially produced as a sliding gear which is quite silent in changing. If he will give me an opportunity, I will with pleasure give him a run on my 36-h.p. Iris, and change gear as often as he likes without his nerves, however delicate, being one whit racked, nor his ears, however sensitive, detecting a symptom of clash!—Yours truly,

G. L. L. HINDS-HOWELL.
Captain, late R.A.

TRACK RACING AND WEIGHT LIMITS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In correspondence with the secretary of the Brooklands Automobile Racing Club, this gentleman has been good enough to inform me that the weight limit which has been applied to various races to be held upon the club's track at Weybridge is not governed by any other rule, i.e., that so long as the chassis scales the weight that the rule demands, either a touring body or a racing body may be fitted to the chassis. Might I suggest that this is a very sound and practical method of applying the weight limit, and it is one that is well worth consideration by club committees promoting hill-climbing or other speed tests, as, in the first place, it not only permits a manufacturer to use one chassis for various races which may be governed by rule applying to a variety of weights, but it obviates the necessity of having the body painted—this is a great cost to a manufacturer, and when it gets damaged and spoiled there is a further cost to the manufacturer. Apart from this, racing with a top-heavy body, with four people seated in it, all tends to make the sport more dangerous. So long as there is a weight limit to be complied with, surely it is far better to apply it in the least costly and dangerous manner?

If it is not too late, would not the Automobile Club of Great Britain and Ireland be well advised to change the present rules applying to the Tourist Trophy Race, and make it a race for chassis only, fitted with racing bodies, and would they not be still further well advised if they were to eliminate the dangerous practice of necessitating the fitting of a glass screen upon a car which admittedly is to race? Personally, I can see no sense in having a touring body with no people seated in it, and I consider it highly dangerous to race with a glass screen to add to one's danger. I should be happy to enter a vehicle for the Tourist Trophy Heavy Vehicles contest if the body and glass screen were eliminated, but I would object to be responsible or even to ask any of my friends or employees to drive a car with the dangerous impediment of a top-heavy body, with the risk of having their throats cut by broken glass.

I congratulate the Brooklands Automobile Racing Club upon the very wise course that they have adopted, and trust that the higher authorities will see their way clear to follow suit.—Yours truly,

D. M. WEIGEL.

AN EXHIBITION IN ST. PETERSBURG.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I give you below copy of a letter I have received, and should be glad if you could make use of same for the columns of your paper. Yours truly,

W. WINDHAM.
St. Petersburg,
March 11th, 1907.

COPY.
Captain Windham,
Foreign Office, London.

Dear Sir,—I beg to inform you that the St. Petersburg Automobile Club will hold an exhibition on and after 15th to 28th May. Having been asked to be a member of the jury, I am anxious to see also British cars exhibited, and, being aware that you take a keen interest in motors-cars, I should be glad if you would use your influence to get some of the firms in your country to exhibit British-made machines. I should advise them to exhibit cars of strong and heavy type, as light cars are not adaptable for Russian roads. I hope you will interest yourself in the matter.—Yours truly,

LUDVIG NOBEL.

ARE CARS TOO COMPLICATED?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been interested in the correspondence on the above subject. In my opinion they are. I had three stops in two years, all through unnecessary complications. My first stop was due to a broken fan belt. I repaired this; it broke again, but, as I did not miss it, in fact thought the engine pulled better, I decided to drop this, in my case, useless complication. I shall not have another fan. I consider a fan is an acknowledgment by the makers that they had not supplied an efficient radiator. My next stop was the advance spark connection—the ball came out of the socket. As there is little need of advancing spark on a magneto, I decided to drop this complication. I had low-tension magneto only, but foolishly allowed myself to be persuaded that it would be safer to have a second ignition, so put in an accumulator with distributor on the dash, driven by a chain. This chain broke and dropped in the magneto gear wheels, so that I had neither—two hours' stop seven miles outside York. When I arrived back I got the maker to allow me £4 10s. for what I gave £11 for, and shall only have

magneto in future. My experience is also that if you have two ignitions you are careless about both, so that neither of them are in good order. I could not break my jump spindle during the frosty weather, as I have not got one, but I know one firm that replaced a dozen pump spindles in a few weeks, so there were twelve stops through another useless complication. My next break was a connecting rod. I drove four miles with the broken rod knocking about, and did not think the rattle was inside. There was not the least damage done. I cannot do without connecting rods or the cylinders. If I could I certainly would.—Yours truly,

ERNEST ESTCOURT.

A PROGRESSIVE CHANGE-SPEED GEAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. Mower's letter in the *M.C.J.* of the 9th inst. is interesting. I once used an epicyclic gear, and was very pleased with it on a small car, but I was assured that it would not be reliable on even moderately powerful cars. If your readers saw the "patent progressive speed gear," i.e., two cones, expanding and contracting, joined by a novel leather belt, exhibited by Jesse Ellis and Co., Kent, I should be glad to learn from them what is the objection to so simple a device. Designers appear to have made but few successful attempts to give us a more rational change-speed gear.—Yours truly,

R. HANNEN.

Touring in Italy.—The Church of St. Paul d'Arno Pisa.

FOUR OR SIX CYLINDERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As far as the controversial aspect of the six v. four cylinder engine goes, I consider Mr. Alex. Govan, manager of the Argyll Motors, Ltd., has earned, and is justly entitled to gather up, the championship honours for his company's 14-16-h.p. four-cylinder Argyll, because he issued a public challenge to makers to run against and beat any make of six-cylinder car on each of the three heads set forward as the outstanding features of the six-cylinder engine. I note the challenge was issued on January 26th. Surely Mr. S. F. Edge is not afraid to meet an Argyll? He has hitherto been looked on as principal authority on six-cylinder engines. In any case it is a pity that there is so little confidence shown by makers of six-cylinder cars, when they in craven fear allow a 14-16-h.p. four-cylinder car to beat them on the three heads which are the outstanding features of the six-cylinder engine.—Yours truly,

JOS. MCCONECHY.

A CORRESPONDENT asks for the address of Messrs. Smith and Co., who retread tyres with a patent compressed band.

A CLINCHER TYRE REPAIR OUTFIT was found by A.A. Patrol No. 57 between Hindhead and Petersfield, on the Portsmouth road, on Sunday last. The owner can have the outfit on application to the Hotel Moorlands, Hindhead.

DR. P. LAMBERT, 81, Queen's Road, Finsbury Park, N., will be pleased if the gentleman driving a motor-bicycle over the hill from the Manor House to Harringay on the 3rd inst., and who witnessed an accident to a motor-car coming up, will communicate with him.

WIRE OR WOOD WHEELS.—In connection with the correspondence on this subject Mr. W. Starley, of 81, Paul's Road, Coventry, sends us particulars of a new all-steel wheel he has devised and which has successfully passed through a lengthy test on a Daimler car.

STIFF TYRE COVERS.—"R. W." writes:—"It may be useful to other motorists to know the operation of fitting stiff tyre covers to rims in cold weather may be facilitated by first warming the covers. By doing this the covers are rendered somewhat more pliable and less liable to crack when the levers are used."

MOTOR LUBRICATION

I HAVE read with great interest, and sometimes also with amusement, the letters that have appeared from time to time in your valuable paper. With the exception of Mr. Veitch Wilson's interesting communication, however, which is based on sense and science, the various writers have shown a greater acquaintance with the art of obtaining free advertisement than of intimate knowledge of their subject. Taking these letters in the order of their appearance, we find Mr. Duncan retailing a lot of statements about a particular oil which his firm is pushing. Mr. Veitch Wilson has aptly described that oil as "unique." Now, of course, we could scarcely expect Mr. Duncan, who is a motor agent, to know much about oils at first hand. I shall attach only my initials to this letter, as my only object in writing it is to warn motorists not to play with their machines and risk their destruction by following some of the crude ideas that have been put before them, but to use only the very best oils and greases they can get; for let me, as an oil chemist and expert whose life work has been the study of the laws of friction and the best means of its elimination, assure them that the very best they can obtain is necessary if they wish to keep their machines from paying too frequent visits to the repair shop.

Mr. Veitch Wilson's practice of compounding the oils his firm sends out is perfectly reasonable, especially in regard to the lighter oils. It is well known to the more experienced and enlightened oil manufacturers that fatty oils have greater staying power than ordinary mineral oils, and it is mainly on account of this quality of greater endurance that they are used to enrich mineral oils. When we come to consider the use of heavier bodied oils, we find that for certain purposes, among which is motor lubrication, we can obtain the staying power we require without the use of fatty oils, by the careful selection and treatment of suitable grades of pure hydrocarbon oils. Even so, the judicious compounding with fatty oils can do no harm. Undoubtedly, when a thin oil is to be used for motor lubrication, it should be a compound oil; and this, I believe, is the practice of all oil manufacturers who make efficient lubrication their chief consideration.

When a really good heavy oil is used, it is extraordinary how long a motor will run without requiring repair. A few days ago I saw a large motor taken down for examination that had been in regular use for two years and had run 9,000 miles. Practically, there were no signs of wear anywhere. Also I know of a single-cylinder car that ran, under observation of the Club, non-stop from Glasgow to London and barely used a quart of oil, while less than a quart of water was evaporated on the entire journey. Similar instances could be multiplied *ad infinitum*; but I need scarcely say that such results cannot be got if no regard is paid to the actual lubricative value of the oil, but only to the price per gallon. This false economy is at the bottom of nearly all the worry and expense motorists are put to in regard to the mechanism of their machines; and it is often a source of vexation to manufacturers who take a pride in the efficiency of the lubricants they produce.

Not many months ago a sample of oil was sent me to report on that was being supplied to a large 'bus company by a firm of London merchants. It was one of the poorest grades of mineral oil, and there was little wonder that their 'buses were difficult to maintain in running order. The stuff was trash, but, as I learned afterwards, the price they were giving was in accordance, so they were just getting what they paid for. Later on, I got a sample of grease to report on from a 'bus company. They were buying it at a price that good grease could not be sold for. As a natural result, they were being supplied with a grease made of very light mineral oil and loaded heavily with French chalk. Now is there any wonder that these 'buses required to be continually tinkered at to keep them running at all? I have seen it stated by some writers in your journal that French chalk is a lubricative improvement when added to grease. Believe nothing of the kind. It is simply added to the grease to cheapen the cost of it. Also it makes the grease look whiter and nicer to the eye, and helps to hide the excess of miserably poor quality oil that is too often used in making motor greases. Black lead (graphite) is used by some. It does not cheapen the grease; but often such greases are made from the lightest and trashiest mineral oil, and in such cases probably the graphite is the only thing that makes the grease useable at all.

But why should French chalk or graphite, or any other solid material, be used in making motor greases? I consider their addition under the circumstances I have stated little short of swindling. There is no occasion from a lubricating point of view to use black lead or French chalk or anything else of a similar nature, for I have no hesitation in saying that if greases are made as they should be made, viz., of good oils and fats properly saponified and then brought to the required consistency with a good quality of oil, then such greases will fulfil every possible requirement. It is, of course, quite true that both French chalk and graphite are lubricants which for some purposes have their advantages; but they are certainly not required to lubricate any portion of a motor, unless perhaps the chains of a chain-driven car, in which case a little fine black lead added to liquefied tallow or good grease in which the chain should be steeped, not merely painted with the grease, may be of some little advantage. Even in this case it is difficult to see how the black lead can be of much service, for it is not easy to perceive how even very fine black lead will gain access to lubricate the links and pins unless a good deal of wear has taken place. In particular, I would utter a word of warning to motorists not to use either of these substances in

any position where there is a possibility of the solid material settling out, otherwise it may block up oil ways and oilholes and cause damage to bearings by preventing the lubricant from reaching them.

Mr. Critchley's letter only goes to show that a good quality of thin oil will give better results than will thick oils of inferior quality. We must remember, however, that there is something more than mere thickness required in an oil to ensure satisfactory lubrication. An oil may be thick, and yet contain a large proportion of low boiling hydrocarbons. It may also carry a considerable quantity of tarry substances; and these, when the lighter fractions vaporise, will form a sticky residuum that will clog the motor. But these defects may be present in either thick or thin oils. It must have been sticky oils of this kind that Mr. Edge was using when he wrote advising that motors should be washed out with paraffin after every run. When good oils are used the motor should not require to be washed out with paraffin or anything else. The principal reason why the use of a good quality of thicker oil is preferable to a thin one is that its higher boiling point enables it to stay on the walls of the cylinder as oil, with little or no vaporisation under working conditions. An oil of this kind does not become sticky. Then, though all oils thin down more or less rapidly under heat, yet the thicker oil retains its lubricating body better than a thin oil at similar high temperatures. True, the difference is little as found by a viscometer; but it is sufficient to ensure a better oil film on the walls of the cylinder, and that is all the user need trouble himself about.

Now let us examine the advantages and disadvantages of the use of thicker or thinner oils of good quality. The more fluid oil may, owing to the greater freedom of its particles, show during a short test a slightly increased efficiency. To obtain that result, a greater supply of oil will be required. Its disadvantages are that, if through any derangement of the cooling arrangements there should be an increase of heat in the motor, then the oil film may become so attenuated as to permit the rubbing surfaces to come into actual contact, in which event "solid friction" will at once take place and a seized piston is highly probable. When an oil is thicker than the working conditions require, it will, owing to the greater adhesion of its particles to each other and to the working surfaces, cause an increase of "liquid friction" until increase of temperature reduces its viscosity to the necessary degree of fluidity. Then there will be no further rise of temperature, and the oil will work continuously with the highest efficiency. There will be little risk of the oil film becoming displaced during a temporary stoppage of the cooling arrangements, and consequently little or no risk of "solid friction" and its attendant danger of damage and seizure.

In these remarks I have dealt with the action of the oil in the cylinder, but they apply equally to all the other moving parts of the engine, modified only by the lower temperature within the crank case. Shortly, then, a trifling decrease of "liquid friction" may be obtained with a thin oil; likewise, as I have shown, some risk of damage to motor. On the other hand, a small increase of "liquid friction" may result from a thicker oil, but there is greatly increased immunity from damage to the motor.

D. D. B.

(To be concluded.)

COMPANY NEWS.

NEW COMPANIES REGISTERED.

COVENTRY SIMPLEX ENGINES.—£3,000. To take over the business carried on at East Street Works, Coventry, as the Simplex Engine Company, and to adopt an agreement with H. P. Lee. No initial public issue. Registered without articles.

CENTURY MOTOR COMPANY.—£15,000. To acquire the business carried on by Mr. J. Yarwood and Mr. W. C. A. Jollands at Cumberland Park, Willesden, and Queen's Gate, Kensington, as the Century Motor Company. No initial public issue. First directors (not less than two nor more than five): W. C. A. Jollands and J. Yarwood. Qualification, £1,000.

THOMAS WOLFE AND SON (1907), LTD.—This company has been inviting subscriptions for 80,000 £1 shares of a capital of £150,000. In addition to having horsed vehicles, automobiles will be added to its operations. The motor department will be under the direction of Mr. Basil Crump. Offices, 1A, Woburn Street, W.C.

TURCAT AND MERY.—£100. Manufacturers and proprietors of, agents for, and dealers in automobiles, &c. No initial public issue. Registered without articles.

HORCH MOTORS.—£15,000. To acquire the undertaking or agency for the sale of motor-cars, accessories, and goods manufactured by A. Horch and Co., of Zwickau, Saxony, carried on by G. S. S. Monck at 34, Shaftesbury Avenue, W. No initial public issue. First directors (to number four): Messrs. G. S. S. Monck, S. F. Tyler, W. L. Stewart, and E. C. R. Parry. 100 shares. Remuneration (except managing director), £300 each per annum.

J. D. FERGUSON, LTD.—£6,000. To acquire the business of motor engineers carried on by Mr. J. B. Ferguson. Directors: not less than three nor more than five, the first being Messrs. Alexander Govan, John C. Nixon (chairman), J. B. Ferguson, and George Henry Ferguson. Registered office, 18, Chichester Street, Belfast.

CLUBS AND ASSOCIATIONS.

THE AERO CLUB.

THE ARRANGEMENTS have been completed by which the Aero Club has been granted by King's College, London, the free use of the engineering laboratory and the services of certain professors for carrying out experiments in the construction of aeroplanes. By these arrangements, which come into operation immediately, the only expense to which the club will be put will be the cost of materials and the services of one or two mechanics. They will, it is believed, greatly stimulate the movement. Special attention will be directed, in the first place, it is understood, to the construction of propellers; next will come the aeroplane itself, and, lastly, the motor.

ST. ALBANS AND DISTRICT M.C.C.

A MEETING was held on Thursday of last week at the Crystal Palace Hotel, London Road, St. Albans, to inaugurate a new motor-cycle club. Mr. Marriott was in the chair, and it was decided that the new club should be called the St. Albans and District Motor-Cycle

July 21st, inter-club team run; September 7th, 200 miles reliability trial, and passenger trials; September 21st, penalty run.

The opening run of the members to Brighton on Saturday was a great success. A start was made from Ditton at 3 p.m., and Brighton was reached via Leatherhead, Dorking, and Horsham at about half-past six. Dinner was served at the Old Ship Hotel, fifty-two members and friends of the club being present. The return journey to London was made the following day via Lewes and East Grinstead.

THE JUNIOR AUTOMOBILE CLUB.

AT the last meeting of the executive of the Junior Automobile Club twenty-eight new members were elected. Mr. E. March, who for many years acted as hon. treasurer to the Motor Cycling Club, has consented to fill a similar position in this club. All inquiries and applications for membership should be addressed to Mr. S. C. Darrington "Oakthorpe," Brownlow Road, New Southgate, N.

It is the intention of the officers of the club to be present at various points, north, south and west of London, each week-end during the approaching season, in order to meet prospective members, as well as those who have already joined. For this purpose members of the executive will be at the Red Lion, Hatfield, at noon on Good Friday, and at the Bear, Esher, at three o'clock on the following day.

BRIGHTON MOTOR CYCLE CLUB.

A GENERAL meeting of the Brighton and District Motor Cycling Club was held at the headquarters in Ship Street, on Thursday week, when there was a good attendance. Dr. Badcock presided. The hon.

Photo by]

The Opening Run of the Motor Cycling Club.—The meet at Ditton.

[E. W. Ashworth.

Club. The subscription will be 5s. per year. Mr. Bush, of the Clarendon Hotel, Market Place, St. Albans, was appointed secretary and treasurer, *pro tem.*, and anyone wishing to join the club is requested to write to him.

A meeting has been arranged for March 21st, at the Peaben Hotel, London Road, St. Albans, when arrangements will be made for hill-climbs and club runs, &c.

MOTOR CYCLING CLUB.

THE following new members were elected at the last meeting of the executive:—Messrs. C. C. Cooke, H. C. Horswill, G. Kelton, B. J. Pritchitt, C. G. Watson, and C. E. Woodward. Messrs. M. V. Abraham, L. A. Baddeley, R. G. Booth, R. C. Davis, R. H. Head, F. J. Jenkins, H. G. R. Slingo, and W. H. Wells were elected to represent the club at the annual general meeting of the Auto Cycle Club Council.

THE first competition of the season will be an open hill climb at Sharpenhoe Hill, near Luton, on April 20th.

On Saturday the Motor Cycling Club held the opening run of the season to Brighton—as we illustrate above.—The fixtures already arranged are as follows:—March 29th, Easter tour; April 20th, open hill climb; May 4th, Albert Brown Trophy for cars; May 17th, London-Edinburgh run for cars and cycles; June 1st, members' hill climb; June 15th, Harry Smith cup for cars; June 29th, 100 miles private owners' reliability trial; July 13th, open hill climb and competition for valuable prizes; July 20th, inter-club team competition at Warwick;

secretary (Mr. H. Clifton) having referred to the satisfactory progress the club was making, the meeting proceeded to discuss the programme for the forthcoming season, and a number of schemes were proposed. Eventually it was decided that the first hill-climbing competition should be held on the 23rd inst. (to-day) on the steep hill running up from Saddlescombe to the Dyke road. A petrol consumption trial has been fixed for May 4th, and a speed-judging test and a reliability trial will shortly take place.

THE MOTOR VAN, WAGON AND OMNIBUS USERS' ASSOCIATION.

AT the annual meeting of this association a proposition will be made to alter the title to the Commercial Motor Users' Association. In the report reference is made to the work of the year in connection with the Select Committee on Cabs and Omnibuses, the registration of motor vehicles by the War Office, the commercial vehicle trials to be held not later than September next, extraordinary traffic, the inspection of members' vehicles, and the annual meeting held at the Cordingley Motor Show in March last.

AUTO CYCLE CLUB.

THE annual meeting of the Auto Cycle Club will be held on Tuesday next, when a membership of 1,620 will be reported. 345 licences were issued to riders and permits granted to 30 clubs enabling them to promote open motor-cycle events during the course of last year. A

new club badge has been designed for fixing either on the handle bar of machines, to the front extension mudguard, or to the front of a tri-car. These badges will render it easy to distinguish members of the club whilst riding along the road, and by this means it is hoped that members will be able to assist each other if in difficulties.

SOUTHERN M.C.

THE fourth annual meeting of the Southern Motor Club was held on Thursday evening at the club's headquarters in Bronfelde Road, Clapham. Mr. Allen Vickers presided over a large attendance of members, which included Messrs. W. Howlett (president), Arthur Lorkin, F. C. Pattison, W. H. Nixon, W. Pratt, S. W. Phillpott, C. H. Pugh, T. E. Goodley, C. E. Bygrave, G. Connor, B. Grottick, A. W. Holt, J. H. R. Lloyd, H. F. Harding, E. A. Belcher, J. C. C. Brodie, H. Gutteridge, W. A. Catherwood, H. Billing, G. Fisher, A. G. East, J. W. W. Cufley, and P. T. Worger. Mr. Walter L. Lorkin (hon. secretary), presented the annual report, which showed that the club was in a sound financial position. The club had continued to watch the interests of automobilists and had done much valuable work in many ways. The Chairman, in moving the adoption of the report, said he hoped that in all matters pertaining to the welfare of the club that they would have the support of its members.

After the transaction of some routine business the election of officers was proceeded with. Mr. W. Howlett was re-elected president, and Messrs. G. Howlett, I. H. Mitchell, Lieut.-Col. Mark Mayhew, F. C. Pattison, H. L. Doulton, and Staplee Firth vice-presidents. Mr. Allen Vickers was re-elected chairman, Mr. George Fisher vice-chairman, Mr. J. W. Cufley auditor, Mr. Walter L. Lorkin hon. secretary, and the following were appointed as the committee:—Messrs. Chapman, Pugh, Connor, Brodie, and Colen Pattison. Messrs. Pratt, Phillpott, and Vickers were elected representatives to the Motor Union, Mr. B. Pattison sports secretary, Mr. Belcher, social secretary, Mr. Goodley treasurer, and Mr. Holt, riding officer.

Receipts of £122 were reported, including £63 as subscription and entry fees. Reference was made to the various successful events that had been held during the past year, and thanks accorded to various gentlemen who had rendered conspicuous service to the club.

SCOTTISH A.C.

THE following further list of official repairers has been supplied us from Glasgow:—Ayr County Motor Company, Ayr; A. Simpson and Son, Brechin; John Rutherford, Jedburgh; Dick Bros., Kilmarnock; James H. Scott, Melrose; New Arrol-Johnston Car Company, Ltd., Paisley; Henderson Bros., Perth; William Wilson, St. Andrews; William H. Cox, Lanark; Andrew Dobie, Castle Douglas; Caledonian Motor Car Company, Ltd., Aberdeen.

The Auto-Cycle Club will hold a penalty run on the 17th prox.

THE Essex Motor Club will have an Easter tour to the South Coast.

MR. F. B. MILD MAY, M.P., has been re-elected president of the South Devon A.C.

ON Sunday the Southend Motor Club had the opening run of the season to Braintree.

THE Cheltenham and District Motor Cycling Club will hold their opening run to Malvern on Good Friday.

THE annual meeting of the Northamptonshire A.C. will be held at the George Hotel, Northampton, on Wednesday next.

DR. BEALES has been elected president of the Yarmouth and District Motor Cycling Club, of which Mr. F. Worts is the hon. sec.

THE Middlesbrough, Leeds, Bradford, Newcastle, Sunderland and Hartlepool motor-cycle clubs will hold an inter-club meet at Richmond (Yorkshire) on Good Friday.

THE first event of the Lincolnshire Motor Cycle Club is arranged for Easter Monday, this being a hill climbing contest at North Carlton, on the road from Lincoln—from whence it is distant four miles—to Kirton Lindsey.

THE MOTOR-CAR AND A COMMON LAW NUISANCE.

AN important decision to motorists has been given in Bath County Court, when a cab proprietor named Woods sued Mr. H. R. Coventry, Monckton Park, Chippenham, for £50 damages to his horse. He alleged that the defendant used a motor-car which in itself was calculated to frighten horses, or was so carelessly and improperly managed by the defendant that it frightened the plaintiff's horse. The car in question was a 60-h.p. Mercedes. Mr. Coventry was restarting it in a Bath Street, when, according to the plaintiff's witnesses, there was a tremendous rattling. By general agreement, however, it was the sudden discharge of smoke and vapour that caused the plaintiff's horse to swerve and rear and put its feet through the window of another cab, injuring itself considerably. The jury found that the accident was caused by the smoke and not by the noise, but that was not due to any negligence on the part of the defendant. The judge pointed out that no case had been determined whether under certain conditions a motor-car created a common law nuisance for which the owner might be liable. Judgment was entered for the defendant with costs.

WORKS ORGANISATION.*

BY PERCY MARTIN.

(Concluded from page 53.)

MATERIAL DEPARTMENT.—I have made this department one of the chief subjects of my paper, because experience has taught me the enormous importance that the supply of suitable materials bears to the successful issue of a manufacturing concern. The first function of this department which we will consider is that of specification of materials.

In order that specifications can be sent out which will give a clear and concise idea as to the character of material required, it is necessary, as in other departments, that proper facilities should be provided. The material department, after having been provided with mechanical specifications by the engineering and other departments, should incorporate in its organisation men of the proper scientific training, and translate such mechanical specifications into the language of the supplier. The material department must incorporate a metallurgist and chemist, as well as a physicist, whose duties are to arrive at the necessary specifications of material to be used for fulfilling the mechanical requirements. This important department should be equipped as with chemical and physical laboratories, also with a complete outfit of furnaces and other appliances for treating the materials after they arrive from the rolling mills, stampers, or forges. It is not too much to say in the light of to-day's knowledge of these subjects that no stamping or forging should be used in machine construction in the condition in which it comes from the stamp or forge. In order that such important functions should be properly dealt with, the material department should above all be thorough and efficient. They should be able first of all to give intelligent specifications; secondly, they should have proper means of ensuring that material is up to specification when delivered, viz., by a proper testing laboratory; thirdly, they should be able to apply whatever treatment is necessary to the material received, thus ensuring that it is handed over to the manufacturing department in the most suitable and unvarying form. In carrying out this last condition it might also be mentioned that it is almost as necessary to leave the material in such condition that it can be economically machined as it is to see that the material will perform its duty when finished. Another portion of the routine work to be kept in mind in connection with this department is that which refers to the price paid for material. The head of such a department should keep in touch not only with his own country, but with all those countries which are noted for progress in the art of producing raw material. The one great factor which influences price of material is admittedly quantity and regularity of requirements. Therefore, this department must be well informed as to the general policy of the company, and should know at the very earliest moment what the probable future programme of the company is to be. Another great question which this department has to deal with is delivery of material. As a rule it is very advantageous for the administrator of this department to keep in very close touch with the people from whom he is buying in order to satisfy himself that their facilities for producing are ample. The ideal condition would be to have your material delivered at regular intervals and in quantities as required, thus enabling you to keep down your stock and make a consequent saving in capital outlay.

Generally speaking, I may perhaps be allowed to repeat in brief the functions of the Material Department such as I would advocate.

Such department would be able through its officials, equipment, and organisation, first, to decide what material should be used to carry out the engineers' intentions; secondly, it should be able to purchase such material to the best advantage; thirdly, it should make arrangements for delivery best to suit the desired programme of production; fourthly, it should carry out a systematic check of all materials delivered with reference to specifications sent out; fifthly, to issue all instructions for the treatment and handling of materials in case the material has not been treated in the manner before referred to previous to delivery; and lastly, this department should carry on systematic experiments and research work, with a view to introducing new and better material from time to time which is consistent with the progress which we are all aiming at.

The last general subject which I would treat with is that of labour, and naturally I have not taken into consideration any of the numerous questions which are only to be decided in view of local conditions, but have simply tried to bring out a few principles which have struck me in dealing with this important factor. I believe it to be true that the highest possible or maximum rate should be paid for skilled labour, instead of, as many managers seek to do, paying the minimum rate. In the first place, the payment of maximum rates gives a larger choice of labour, and maximum rates being paid the best men can be chosen and retained. Being certain of retaining your labour and having confidence in the thoroughness and reliability of your operators, it is then a matter of obtaining the maximum results from your men, not by driving them, but by a system of induction which enables the operator to participate in the results achieved by any extra efforts he may have to put forth. To condense the foregoing remarks into one principle, this means that one should pay the highest possible rate that a man can earn—but see that he earns it according to the individual earnings per man. The only standard from which it is possible to judge your wages spent is the relation it bears to the

*From a paper read at the meeting of the Institution of Automobile Engineers, on March 13th.

output of the factory worked out in units. It is not so much what each man earns individually, as what is produced in your works by the payment of so much in wages; and methods must be sought, not to reduce the rate of pay of your men, but actually to increase same, taking care that such increase is more than recompensed by the extra output achieved. This leads on to the consideration of the bonus system of paying wages as a means of increasing earnings of men, and ensuring at the same time more than a corresponding increase in the output. The principles of the bonus system are chiefly as follows:—Divide up work in the factory into jobs, considering these jobs as units of work. Each of these jobs is provided with a time allowance by the rate-setting department. These allowances should not be fixed by the old method of observation, but from charts and curve tables of data established by your actual previous results in different metals, operations, &c., or from other accepted sources of information.

In conclusion, I would say that having stated as briefly as possible a few of the principles of works organisation, and having called attention to a few of those functions or departments which I consider are of maximum importance, I would like to impress upon you some of the things that a works manager should avoid in running his works. If a manufacturing institution is organised with due consideration to order and cleanliness, and the responsible officials are inspired with a desire to get the best possible results, I think it is fair to say that the natural tendency is for things to organise themselves. The details of each department seem to be worked out automatically, without the chief officials concerning themselves to any great extent. Therefore, feeling that this is true, I have seen fit to add a few "Don'ts" as concluding remarks:—"Don't allow a programme of output, once settled, to be changed. Don't be tempted to accept special orders at a high price, because it can never pay to introduce a multitude of types or to upset routine work. Don't encourage secrecy between your officials, but, on the contrary, let every department head and trusted official in your organisation understand to the fullest extent your own views, intentions, and aims. Don't neglect to maintain your reputation at any cost. Institute a thorough system of inspection after each operation and make exhaustive tests before delivery; in other words, spend money freely to ensure that that which you deliver is certain to uphold and create a good reputation.

PUBLIC MOTOR SERVICES.

THE cost of working a petrol motor-omnibus of the better makes, under proper conditions, and running an average of 100 miles a day for 280 days per year, or 28,000 miles per annum, said Mr. Beaumont, in the course of a paper read on the 15th inst. before the Institution of Mechanical Engineers, may now be put as follows:

	Pence per Mile.
Depreciation at 20 per cent.	1-30
Driver and conductor	2-20
Tyres, per contract	1-75
Petrol, or fuel of other name, at 9d. per gal.	1-63
Oil and grease	0-15
Renewals and repairs	1-30
Washing, stabling, lighting, and sundries	0-45
Insurance	0-40
Supervision, assistants, ticket service, and inspectors, sundries	0-38

Total working costs 9-56

The average receipts per motor-bus mile in London exceed 13d. per mile.

THE adjourned annual general and extraordinary general meeting of the Isle of Wight Express Motor Syndicate, Ltd., was held at Ryde on the 14th inst., for the purpose of taking the poll. Messrs. Angove and Macklin, who had retired from the Board prior to the meeting, as a protest against the policy of Sir Alexander Onslow, Colonel Hamilton and Mr. Milward were re-elected.

THE Watch Committee of the Brighton Town Council have approved of an application from Mr. W. H. Holden for the licensing of ten motor char-a-bancs and twenty motor-cabs, provided they are approved by the Chief Constable.

THE somewhat novel defence raised to an action brought by the Hampstead Borough Council against the London Power Omnibus Company, at Marylebone County Court, was that the plaintiffs were themselves responsible for the skidding of the defendants' motor-bus in that they had not kept the thoroughfare where the accident occurred in fit and proper condition. Mr. Cecil Fitch, plaintiffs' counsel, said one of defendants' vehicles was descending a slight gradient in the High Road, Kilburn, when it skidded and knocked down an electric standard. The accident had cost the plaintiffs £29 odd, and it was to recover that amount that proceedings were instituted. Mr. Benson, for the defence, contended that the accident would not have occurred if gravel had been thrown down on the wood pavement, which was in a slippery and greasy condition. His Honour, in finding for the plaintiffs, said he did not know what the motor-bus companies would want next. They expected the highway authorities to provide specially prepared roadways to prevent their vehicles skidding, and did not pay a penny extra towards the rates unless their buildings happened to be in the district. He could not see that the local authority was in any way responsible.

CASES UNDER THE MOTOR CAR ACT.

RECKLESS DRIVING.

AT Barnsley West Riding Police Court, William Wentworth Clarke, mining engineer, Tankersley, has been charged with recklessly driving a motor-car at that place on August 27th last. The case had been delayed pending the result of a county-court action arising out of the same incident, when judgment was given against the defendant. Mr. Hewitt, who defended, said the defendant had already had to pay damages. In a moment of grave peril he committed an error of judgment. The Bench imposed a fine of £5 and costs, and endorsed defendant's licence.

At Shoreham Petty Sessions, on Monday, Mrs. Ada Adlard, of South Kensington, was fined £20 for driving a motor-car at a speed dangerous to the public at Southwick on February 18th. A summons against Mr. A. K. Adlard, her husband, for aiding and abetting the offence was dismissed. In evidence it was stated that on the day in question Mr. Adlard had been fined at Shoreham for furious driving, and it was while his wife was driving to Brighton from the Court the present offence was committed.

A QUESTION OF LICENSING.

At Stratford, on Saturday, William Beard, London Road, Romford, was summoned by the police for driving a motor-car without a licence; Ernest Boumann, of Grafton Road, W., was summoned for driving without a licence and allowing his identification plate to become indistinguishable; and Ernest Marti, of Church Street, Shaftesbury Avenue, W., was summoned for employing an unlicensed person to drive, and also for fraudulently lending his licence. All the defendants pleaded guilty. Mr. Barker, who prosecuted for the police, said at 2.55 p.m. on February 15th Sergeant Davis saw a motor being driven by Boumann at Park Side, Chingford. The letter "L" and part of "C" on the front were broken, and the mark at the rear was obscured by mud. Two hours afterwards the car was seen in High Road, Woodford. Beard was then

A Roadside Lunch.—A Reminiscence of Summer.

Photo by [Mr. A. M. Wastnag.

driving, and when stopped said he was only a learner, and had not got a licence. Boumann said he was the driver, and had a licence, but had left it at home. He gave the name and address of Marti, and later in the day drove to Woodford Police Station and produced a licence issued to Marti. In the meantime Marti had been seen by the police, and admitted that he had employed Boumann, and also that he had lent his licence. Beard was fined 10s. and 5s. costs; Boumann 40s. and 5s. costs, and 5s. and costs; and Marti 10s. and 5s. costs on each of the two summonses.

EXCEEDING THE LIMIT IN PARKS.

At Feltham, on Friday, a chauffeur, named Symes, was summoned for driving a motor-car in Bushey Park beyond the ten-mile speed limit. A park-keeper, who timed the car with a stop-watch, said it was going at a speed equal to twenty-two miles an hour. Two other park-keepers gave corroborative evidence. Defendant declared that the car was going quite slowly—not more than eight miles an hour, and he called another chauffeur who was riding with him, and who put the speed of the car at between eight and ten miles an hour. The chairman said the Bench did not believe a word the last two witnesses had said, and a fine of £5 and costs was imposed. The owner of the car said he would appeal against the decision.

The Earl of Portarlington was summoned at Kingston, on the 14th inst., for driving a motor-car at a greater speed than ten miles an hour in Richmond Park. A park-keeper said the defendant was timed and found to be travelling at the rate of twenty-five miles an hour. The earl did not appear, but was represented by counsel, who said he admitted the offence, and regretted his inability to attend the court. Counsel was also sorry that he had not got his lordship's licence, as they had telegraphed for it, and it had not arrived. The Bench imposed a fine of £3 and 8s. 6d. costs.

ROAD REPORTS.

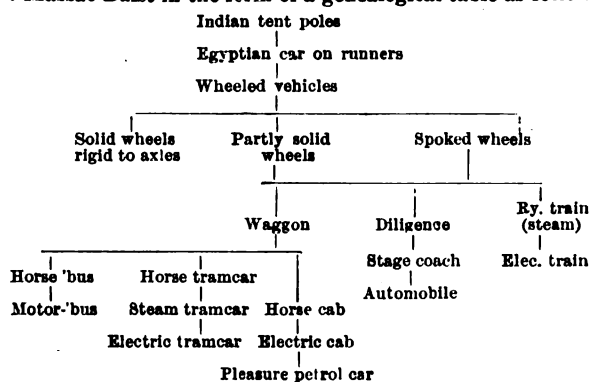

HULL.—The Town Council of Hull has been for some time carrying on a policy of widening on the main roads. It is at present dealing with a section of the Anlaby Road and is also negotiating for land for widening the Cottingham Road. Last year Mr. A. E. White, M.Inst.C.E., treated some roads with oil gas tar with some degree of success and purposes repeating its use on a larger scale this year. The ordinary road material (Durham whinstone bound with local gravel), however, is practically dustless with any traffic except that of fast motor-cars.

SUSSEX.—The roads in the neighbourhood of Petworth, Stopham, and Fittleworth have been under repair, while in the Cuckfield district the High Cross Road, Albourne, and the Handcross to Balcombe roads have been metalled and rolled.

KINGSTON.—Motorists familiar with Kingston will know the cross-roads which connect Thames Street with Wood Street and Clarence Street, the latter being the thoroughfare along which the electric tramways run, while the other two are at the opposite side of the crossing. The tramways have, it is alleged, a compulsory "halt" at the corner of Clarence Street and Wood Street on their way from Kingston Bridge, with the result that the already narrow roadway is further constricted at an important point. When a tramcar is stationary at this point the occupants of vehicles behind cannot see the traffic ahead or that coming in the opposite direction, while traffic turning out of Thames Street to go towards Kingston Bridge, or *vice versa*, runs great danger, especially as there is another "halt" at the corner of Thames Street and at the opposite corner of Clarence Street. It is suggested by the Motor Union that the danger would be mitigated if the halt for down trams were moved further down Clarence Street after Wood Street has been passed.

THE EVOLUTION OF THE MOTOR VEHICLE.

METHODS of locomotion have been quickened in civilised countries within the last hundred years, and only comparatively recently have they gone beyond the means of conveyance still laboriously followed in lands not yet emerged into the wider world. And yet there have been few stages from the earliest ways of progression to the easily-regulated and rapidly-moving motor-vehicle of to-day, as was recently shown by Mr. H. Massac Buist in the form of a genealogical table as follows:—

MOTOR-'BUS DRIVERS AND EMPLOYERS' LIABILITY.

ON the 15th inst., in the King's Bench Division of the High Courts of Justice, Mr. Justices Darling and A. T. Lawrence heard an appeal by a plaintiff named Smith, the driver of a motor-omnibus, from the decision of Judge Bacon at the Bloomsbury County Court, who had entered judgment for defendants, the Associated Omnibus Company, in an action brought by the plaintiff to recover damages for personal injuries. The learned judge came to the conclusion that a motor-'bus driver was not a workman within the meaning of the Employers' Liability Act, 1880.

Mr. Justice Darling, at the conclusion of the arguments, said that in his opinion the driver of a motor-omnibus was a workman within the meaning of the Employers' Liability Act, as he was "engaged in manual labour." The case would go back to the county court to be re-tried.

MOTOR-CAR ACCIDENTS.

STEPPING off the pavement in Seven Sisters Road, Islington, to hail an approaching tramway-car on Friday of last week, a man named Richard Herbert Margerum was knocked down and killed by a motor-car driven by Ralph Taylor, chauffeur to Colonel Lockwood, M.P. The motor-car collided with a tramway standard and was considerably damaged, and broken glass struck Mr. Whetnall, who was in the car, inflicting severe cuts on the face. The chauffeur on Saturday appeared at Tottenham Police Court charged with the manslaughter of Margerum. The accused was remanded, bail being allowed. On Tuesday the coroner's jury said there was no blame to be attached to Taylor.

A MOTOR-CAR accident has happened on the Tideswell and Miller's Dale road. Mr. James Furniss, of Litton, was returning from Miller's Dale Station, and when near Breezedale a Sheffield motor-car collided

with his trap, knocking the body off the axle. Mr. Furniss was thrown violently on the bank side, and was severely shaken. The back axle and radius rod of the motor were badly bent.

BUSINESS NEWS.

MR. ERNEST H. ARNOTT has joined the staff of the New Arrol-Johnston Car Company, Ltd., of Underwood, Paisley, and will drive the new Arrol-Johnston cars in all the principal competitions this year.

MESSRS. MORGAN AND CO., Long Acre, London, W.C., have secured the British Agency for the Adler cars, made by the Adler Werke of Frankfurt-am-Main, Germany.

FROM Messrs. McNeil, Hutchison, and Company, Ltd., Manchester, comes a copy of their new catalogue of Cotteneau cars, in which particulars and illustrations are given of the latest models.

MESSRS. DENNIS BROTHERS, LTD., have just secured an order for three motor char-a-bancs for service at Colwyn Bay.

THE London County Council has just placed an order for five steam wagons with Messrs. Fodens, Ltd., Sandbach.

MESSRS. S. F. EDGE, LTD., have issued an illustrated circular, entitled "Useful Tips for Motor Car Users," which deals with the adjustment of coils in order to obtain perfect sparking.

FOR the convenience and advantage of their agents, as well as owners of garages generally, the Ariel Motors (1906) Ltd. have brought out an excellent clock, which is substantially made, with an appropriate figure of a car on the dial. Recognising the mutual advertisement it provides, the company are supplying it at a very reasonable figure to those willing to inform their clients of the time of day.

WE have received from Messrs. Laurin and Klement, of Jungbunzlau, Austria, several catalogues relating to their cars and motor-cycles. This firm has established an excellent reputation on the continent, and has numerous successes to its credit.

DURING last week Messrs. Friwell, Ltd., held a special sale of heavy commercial vehicles, as well as ordinary pleasure motor-cars. The auction rooms were well patronised, and during the particular afternoon over £2,000 were realised on certain vehicles within fifteen minutes.

A NEW list of the Validus non-skids, both vulcanized and detachable, has been issued by the Validus Non-skid Motor Tyre Company, 109, Victoria Street, S.W. The special feature of this list is the new retread with rubber insertions. The company also does round and square retreads, and can quote for this work at low prices consistent with good workmanship and material.

FIAT MOTORS, LTD., have sent us a circular giving particulars of the "Fiat" commercial vehicles. The Fiat Company was one of the first to realise the enormous possibilities of the petrol motor for commercial purposes, and as far back as 1903 this company supplied motor-luries to the Italian and Portuguese Governments for military purposes. In consequence of the increased demand for this type of machine a special factory has been built and equipped for the manufacture of Fiat commercial vehicles. The Fiat Company's engineers recently visited this country with a view to constructing a vehicle specially adapted for the English market, as a result of which the design of the vehicles has undergone a complete change, the company being now in a position to supply a chassis which meets all requirements. The North Eastern Railway Company, which recently sent their engineers to the Fiat factory, has placed an order with the company for ten motor-omnibus chassis.

MESSRS. HANS RENOLD, LTD., Manchester, have just issued a new catalogue of the Renold roller chains for motor-cars, 'buses, and wagons. They are made in a variety of pitches ranging from $\frac{1}{2}$ in. to $2\frac{1}{2}$ in., the dimensions being given in both English and French measurements.

THE third extension of the motor body building department during the past two years of the Star Engineering Company, at Wolverhampton, has just been finished and opened. This section of the factory now practically covers 22,600 feet; the machinery, which is of the most up-to-date description, is all driven by electric motors and the works are lighted by electricity generated on the premises.

DURING last week several agents and friends accepted the invitation of the Wolseley Company for a run down to inspect their Crayford works. The journey was made on a new petrol-electric 'bus, in which change-speed mechanism and clutch are entirely dispensed with, the drive being conveyed by means of a generator and separate electric motors to the road wheels on the British Thomson-Houston system. The vehicle is in every other respect the standard Wolseley-Siddeley 'bus as in use by the London General Omnibus Company at the present time. Good running was made over what is admitted to be an exceptionally heavy trial road, both as regards traffic and the severe gradients. At Crayford the visitors were much impressed by the organisation of the shops and the various processes of manufacture. The large testing track attached to the works was also made use of to try the paces of one of the new 18-h.p. Siddeley live axle cars. This track is just under a mile in extent, and at one side a specially made test hill has been arranged in order that vehicles may be tried and passed as absolutely ready for the road before leaving the works.

THE Electric Ignition Company, Ltd., inform us that the fire at their stores at Birmingham will not interfere with their deliveries.

WE learn that the Logan Motor Car Company have taken offices at Fenchurch House, 5, Fenchurch Street, London, E.C., where this system will be handled as regards Great Britain. The Logan Company will exhibit several of their cars, including a butcher's van, a ten-passenger char-a-banc, and a 20 cwt. lorry, at the Cordingley Show.

THE Motor-Car Journal.

LONDON, SATURDAY, MARCH 30, 1907.

[No. 421.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

THE Policeman's Hand has hitherto been the regulating force of the traffic of the streets; whether it is to be superseded by a kind of intuitive sense on the part of drivers we know not. Earl Russell is evidently of the opinion that something of that kind may take place in the future. Meanwhile he has been giving his views on the Scientific Regulation of Traffic to the members of the Royal A.C., suggesting half a dozen points which, if enforced, would add to the safety and promote the rapidity of travelling on the highways. They are as follows:—Dangerous corners should always be indicated by signs; no vehicle should enter a main road from a side road without coming to rest; drivers should always be accompanied by a second person to signal approaching vehicles and assist in controlling the animal; a raised footpath should be provided for pedestrians; licences should be issued to all drivers on main roads and all vehicles travelling at night should be lighted both back and front. This probably is the basis of a kind of Utopia, but the way in which the House of Commons approved of the Lights on Vehicles Bill indicates that a sane view of road problems is now being taken by public men. Herein is a hope that the necessity of constructing highways on a scientific plan, having regard to the exigencies of traffic, will be recognised before long by the responsible authorities.

Badges.

FOLLOWING the initiative of the Automobile Association, which provided its members with badges so that they might distinguish each other when upon the road, all the great national motor-car organisations seem to be decorating the vehicles of their members in the same way. The Motor Union has now its distinctive embellishment for cars and the Auto Cycle Club has its badge for motor-cycles. Now the Scottish Automobile Club has devised a plan by which a badge will be issued on loan to members for attachment to their vehicles. Possibly the idea is that it will be returnable should the member be guilty of inconsiderate driving or some similar offence. But the favour with which the idea of the badge has been taken up suggests that the day is coming when artistic embellishments of many kinds will be available for the decoration of cars and the mystification of the police and others who will try and find cryptic meanings in the various monograms and signs found on automobiles. Mr. Tom Browne's view of the matter appears on page 90.

The Motor Union.

ARTHUR Stanley, M.P., was able to tell of a membership of 14,792 and a record of good work not only in preserving the interests of motorists throughout the country but also in carrying the attack

into the camp of persons who assume the offensive against individual motorists. That is a point of considerable importance and should do much to assist Mr. Rees Jeffreys and his excellent staff in raising the total number of adherents to 20,000 ere the occasion of the next annual meeting. Everyone is now anxiously awaiting the report of the Fuels Committee of the Union, which is hoped to have something definite to say with regard to a matter of practical concern to all who motor, and we trust Dr. Hele-Shaw's anticipations as to its interest will be fully realised.

Applications for Motor-Car Restrictions.

THE Motor Union is making enquiries into two applications made by public authorities to the Local Government Board for restrictions to be imposed under the Motor Car Act. The East Sussex County Council are seeking to impose a five mile speed limit upon a portion of the highway leading from the Lewes to Eastbourne main road at Berwick to Seaford. The First Commissioner of Works has also applied for an Order to prohibit the driving of motor-cars on the highway known as Barge Walk, between the river Thames and Hampton Court Park, extending from Kingston Bridge to Hampton Court Bridge. Unless it appears that these restrictions are necessary to ensure the safety of the public they will be opposed by the Union. Any motorist who is in a position to supply information respecting the character of the roads in question and the nature of the traffic upon them is invited to communicate with Mr. Rees Jeffreys, at 1, Albemarle Street, W. Notices of objection must be deposited with the Local Government Board by the 3rd in the case of the East Sussex application, and by the 8th prox. in the Hampton Court case.

Road Improvement Competitions.

IT has been decided that the Tar-Spreading Competition of the Roads Improvement Association shall be carried out about the middle of May—this having just been settled at a meeting of the Council of the Roads Improvement Association and the Judges' Committee of the Competitions. The latest entries received for the Tar Preparation Competition are from Messrs. Hahnite and Messrs. Kay Brothers, Ltd. All intending competitors should send in their forms to the Hon. Secretary of the Roads Improvement Association, 1, Albemarle Street, Piccadilly, W., as soon as possible, as the entry lists close for both competitions on the 31st inst.

Changing Seats on the Car.

SOME time ago a well-known London M.P. had a serious accident in Wales, through being thrown out of a motor-car while in the act of standing to put on his overcoat—a mishap that nearly proved fatal. Too much care cannot be exercised by motorists when on the car, and it is always well to slow down when changing seats. On Monday evening an alarming accident due to the neglect of this precaution occurred at Llangollen. A large car was being driven along the Abbey Road in that pleasant town when the owner of the vehicle essayed to change seats with the chauffeur. In doing this the steering wheel was neglected,

and the accelerator accidentally pressed. The car swerved to the side of the road, dashed over a parapet, through the boundary fence into the grounds of a large house on the road. The occupants of the car were all hurled out, one lady being caught in the branches of a tree. The thick glass of the wind screen of the car was shattered, severely cutting the chauffeur, who was treated at the local hospital.

By Coach to Brighton.

MOTOR coaching should become as popular as that of the older form: and the enterprise of Fiat Motors (Ltd.) in establishing such a service between London and Brighton should prove popular with the public. The 40-h.p. vehicle which is employed in this way is luxuriously appointed, and making the journey in about two and half hours, will prove a new delight to the habitue of the road. In olden times as many as thirty coaches reached Brighton from town in the day, and, given a good summer, something like a return to the ancient glories of the road should be possible ere long.

Mr. C. Jarrott leaving the Royal Automobile Club on his record run to Monte Carlo on a 30-40-h.p. Crossley Car.

London to Monte Carlo.

BUT this trip to the seaside has been overshadowed by the notable efforts made during the last few days to attack the London to Monte Carlo record—an event that aroused considerable interest at various points of the journey. On Saturday morning Mr. Charles Jarrott left the Royal Automobile Club in Piccadilly at 8.30 a.m., and at 7.35 p.m. on Sunday he stopped his car—a 30-40-h.p. Crossley, at the Hotel Hermitage, Monte Carlo, having taken but 35 hours, 20 minutes on the journey, two hours and ten minutes less than the time occupied on his memorable trip of last season. Even better running would have been credited to Mr. Jarrott but for punctures before he left England, and a stop of an hour and a quarter at Beauvais in getting a broken lubricating pipe repaired. Some of the lost time was, however, made up on the way to Versailles, from whence to Aix five passengers were carried. Between Auxerre and Chagny nearly two hours were lost owing to a French mechanic having piloted them on to the wrong road. These mishaps, however, add to the excellence of the performance of the car, which behaved in true British fashion throughout the long jaunt.

A Night Out.

ON Thursday evening of last week Mr. Arthur Earp, accompanied by Major C. G. Matson, attempted to lower the London to Monte Carlo record on a 40-h.p. six-cylinder Iris car. Unfortunately, however, despite the excellent running of the car, the motorists had an unpleasant experience, which prevented the realisation of their ambition. All went well from London to Dieppe and from Dieppe to St. Etienne, some 350 miles to the south-east. Trouble came when darkness fell, for something went amiss with the generator supplying acetylene gas to the headlights, which were continually blown out. On the St. Etienne Pass snow three feet deep was encountered. It was impossible to proceed without a powerful light, and there was nothing to be done but to await the dawn. The four members of the party slept in the car until daylight came. The long stop of course precluded any further attempt at record-making. Ultimately Nice was reached on Saturday afternoon, and a stop was made there. Major Matson telegraphs:—"The time the car was actually running, deducting all stops along the road between Dieppe and Nice during the day and night, was about twenty-five hours, and the distance covered was 739 miles. The reliability and comfort of the six-cylinder British car are amply proved, and it will certainly become a popular type. The Palmer tyres did splendidly."

Easter Tours.

FOLLOWING a time-honoured custom of the M.C.J., we take advantage of the near approach of Easter to invite readers who discover new routes, or find fresh beauties in the old ways, to send us brief descriptions of their experiences. Such accounts, especially when particulars of the mileage and the hospitable places encountered on the road are given, are of real value to other touring motorists. No modern movement has so quickly established a spirit of comradeship amongst its devotees as motoring—a fact to which our columns continually bear witness. Doubtless we shall often hear from old friends during the coming season; letters from new readers will also be welcome, and where these chronicles of journeys by motor-cars can be illustrated with photographs our pages will be correspondingly brightened. The fine week-end that most parts of the country enjoyed last Saturday and Sunday tempted many motorists on the roads, and those to Portsmouth and Brighton in the south and the popular highways of the north seemed to regain something of their summer appearance.

Photography.

PHOTOGRAPHY has indeed received quite an impetus from the general advance of motoring; for the car enables travellers to find new delights in their own country, as well as abroad. And thus it is that the enthusiastic motorist, finding fresh pleasures, betakes himself to the camera to obtain permanent impressions of the beauty spots of England. This is but one sidelong illustration of the varied influence of the automobile in developing other aspects of industry. For many of the more energetic dealers in photographic materials are specially catering for motorists on tour; and throughout the country many illustrations of the associations between the motorist and the photographer can be discovered.

Commercial Vehicles in Scotland.

NOT content with having taken a useful part in encouraging the development of the motor-car for touring and pleasure purposes, the Scottish Automobile Club has now established a Commercial Vehicles Department that promises to do much to promote that side of the motor movement. Already it has rendered assistance to the Mechanical Transport Committee of the War Office in securing the registration of commercial vehicles north of the Tweed, and although the committee responsible for the new branch will be subject to the

jurisdiction of the general committee of the Scottish A.C., its freedom of initiative will in no way be cramped, so that Scotland now possesses a new motor organisation with all the strength that the parentage of the older Club can give it. The objects of the new department will be to protect the rights of users of heavy vehicles, obtain the removal of harassing local regulations, &c., organise tests, promote the improvement of roads, and generally encourage and popularise the commercial side of the movement, as yet untouched by the ordinary work of the Club. Mr. R. J. Smith is secretary of the Commercial Vehicles Department, so that its organisation should be well begun.

A Famous and Ancient Hall.

CHESHIRE is noted for its half-timbered buildings, the most famous of which is Moreton Old Hall, shown in our illustration. This is one of the best known specimens in the country, rivalling even the halls of Bramhall and Adlington. It is situated just off the main road from Congleton to the Potteries, and is a favourite resort for motorists and photo-

graphers as well as for antiquarians. The hall possesses a noble courtyard, and is surrounded by a moat. Our picture was taken when Mr. Sawley Brown, a leading member of the Manchester Motor Club, was visiting the place with a party of motorists. He is seen standing by his trusty 16-20-h.p. Argyll car, on which he has toured throughout the county of Cheshire.

MUCH comment has been made, in previous years, with regard to the bodies fitted to cars in the Tourist Trophy race, and at the last meeting of the Club Committee a letter from a member of the trade was read, suggesting that they should insist on all cars in competitions being fitted with ordinary touring bodies, and not with bodies specially made for the occasion. It was pointed out, however, that under the Club's

Touring Bodies in Competition.

[Harry Wade.

formula wind resistance and weight were taken into consideration, and there was therefore no inducement for a competitor to fit his car with a body not of the usual touring pattern. Instructions were given for this to be pointed out to the member, and to competitors generally. Whether this formula has secured all that was intended is a matter of considerable doubt.

THE news that the governors of Elstree School had become alarmed at the number of automobiles using the highway in the vicinity of their establishment and had determined to construct a subway in order to protect the lives of

A School Subway.

their proteges has been heralded in the general Press as another instance of the risks that the motor-car has brought upon the people. In fact, the statement has been published in such a prejudiced fashion that we have been at some pains to ascertain the exact position of things with regard to this well-known school in the county which Charles Lamb was fond of designating as homely Hertfordshire. The Rev. F. W. Lushington is the headmaster of Elstree School, which is a private school for boys under fourteen years of age. He assures us that the danger

Dunstable and the Dust.

THE position of Dunstable on Watling Street and Ickneild Street, the former being on the main road from London to Holyhead, has rendered it familiar to motorists, and it is computed that during the summer months as many as 300 to 400 motor-cars pass through the little town every day. In recent years the residents and shopkeepers occupying premises on the high road were compelled to keep their doors and windows closed—a precaution which did not keep them wholly free from the dust of the street. The regular employment of the water cart proved unavailing in allaying the grievance. A year ago a new Borough surveyor, Mr. John Stewart, was appointed, who quickly concerned himself with the problem that he knew would

arise in the summer, reporting to his Survey Committee in favour of tar-painting the roads. In April a length of about a quarter of a mile was dealt with in such a way that the Committee, recognising the efficacy of the work, approved of its extension to the whole of Watling Street and Ickneild Street that were within the area of the borough jurisdiction. Throughout the whole of last summer the roadway proved a great success, and the dust of previous years was unknown. Its behaviour during the winter has been such as to warrant the claims of permanence for this method of dust laying, the surface having withstood the sharp nipping frosts with the hardihood it defied the heat of the sun. It is gratifying to know that other local authorities in the district are considering the adoption of this plan, and so there is a possibility of the increased popularity of that section of the road and a lessening annoyance to residents from the passage through Dunstable of hundreds of motor-cars every week.

An Australian Reliability Run.

THE number of motor-cars privately owned in Australasia is steadily increasing, and we learn that the Premier of Victoria frequently uses one in his visitation of Government departments in the colony. So far the Government of that part of Australia has refrained from introducing special legislation with regard to motor-cars, although persistently urged to do so by some of the influential journals. As in the Old Country, motorists there have everything to gain by the postponement of efforts in this direction. In another column our Correspondent suggests the institution of a Reliability Run on somewhat severe lines, and, in view of the growing circulation and influence of the *M.C.J.* throughout the Australasian colonies, we would remind our readers that Trials and Reliability Runs have done much to further the movement here, and should be utilised to advance the rate of progress in countries where the advent of the automobile is a matter of commercial value as well as of pleasurable interest. In this connection it is of interest to learn that during their sojourn in this country each of the Colonial Premiers attending the forthcoming conference will have a motor-car placed at his disposal.

Cordingley's Motor Show.

FOLLOWING the Olympia heavy vehicle and boat exhibition is the Cordingley Show, which will be held from April 6th to 13th at the Agricultural Hall, and which continues to flourish annually despite the heavy frowns of the powers that be. "In a conversation with Mr. Cordingley I was somewhat surprised," says the writer of "Motoring Notes" in the "Onlooker," "to hear that next year will see the Hall almost twice its present size, by reason of the proprietors having bought up thirty-seven houses adjoining, which will be demolished to bring about the enlargement." "It cannot be denied," continues this well-informed writer, "that the Cordingley Show, from a purchaser's point of view, is fixed at a very happy date, and it will not be a matter of surprise if brisk business results. It is useless to discuss or deny the fact that business at the last November Olympia Show was not all that was anticipated or desired, and, with the exception of one or two firms, the volume of business was principally confined to agents. It seems a thousand pities that amicable relations cannot be brought about between the Society and Mr. Cordingley, as the majority of the bondholders would like to have at least one or two of their latest models on view at a period of the year when the purchaser is walking about with his cheque book in his hand. Granting that it is impossible to hold the Olympia Show much later than November from the manufacturers' point of view, I contend that it is the wrong time of year for sales, and, after all, that is one of the prime reasons for exhibiting. I would therefore suggest that the Society allowed agents of the 'barred' cars to exhibit at the Cordingley Show if they wished; for, just as the Olympia Exhibition in November is the best time for the manufacturer, so the Cordingley Show is the psychological moment for the agent."

The Flexibility Trial.

AFTER having been the subject of much critical correspondence, the flexibility trial organised by the Crystal Palace A.C. took place on Saturday, attracting fourteen entries, of which ten actually started. Shortly after 8 a.m. the first car went forth from the Crystal Palace for Bexhill, where all arrived soon after eleven o'clock. The motorists proceeded to the Earl de la Warr track, where they engaged in speed trials. Firstly high speed trials were made, the distance being a quarter of a mile. Subsequently "crawling" tests engaged attention, the distance being 110 yards. The trials lasted until 1.30, when the motorists adjourned for lunch at the Sackville Hotel, and later—about three o'clock—the return journey was embarked upon, times being taken up River Hill, which was negotiated by Mr. Cecil Edge on the 60-h.p. Napier on his top speed gear all the way—as shown in our photograph on page 96. The actual results on formulæ have yet to be ascertained, but the general results were as follows:—

Car.	No. of cylinders.	Fast speed. M.P.H.	Slow speed. M.P.H.	Engine stops.	Gear changes.
60-h.p. Napier	6	57.69	3.48	nil	nil
40-h.p. Ford	6	48.38	6.36	nil	1
24-h.p. Courier	4	46.39	5.28	3	4
35-h.p. Maudslay	4	40.54	5.16	1	1
28-h.p. Mass	4	40.18	6.36	1	1
14-h.p. Vulcan	4	39.13	4.75	nil	2
30-h.p. New Engine	4	35.29	7.70	nil	9
30-h.p. Brooke	6	34.51	6.36	1	13
16-h.p. Reo	2	34.28	7.03	nil	3
24-h.p. Porthos	4	34.28	7.70	—	—

The Porthos was withdrawn before leaving Bexhill, the mechanic having slipped off the step when he was riding.

ALL the Dunlop Tyre Company's depots will remain open during the Easter holidays in order to execute urgent orders from users of those tyres.

THE MOTOR CAR DEPOT established in Police Street, Brighouse, by Mr. John Hoyle is being again extended to meet the growing business in all types of cars. A special feature is made of the sale and exchange of second-hand vehicles, and the ten years' experience of the proprietor in the automobile business stands him in good stead in this department. The premises include a garage and repair shop, and among Yorkshire motor depots this one occupies a good position.

A COMPANY has been registered in London under the title of the "Argyll Motors (Continental), Limited," which has for its purpose the exploitation of the well-known Argyll on the Continent. Mr. Leicester, one of the directors of the company, is at present in Paris arranging for the establishment of a depot in the neighbourhood of the Rue de la Paix for the sale of Argyll cars, and a large garage and repair workshops is also being acquired near Paris. It is the intention of the company to open branch establishments in all the principal cities and towns throughout the Continent and to also let out cars on hire for long or short periods.

THE Technical Year Book, 1907, represents the exercise of the quality of "intelligent selection" on the part of Mr. A. C. Kelly and Mr. C. Weeks, and gives within the space of 400 pages a resume of the data and memoranda of importance that have appeared in the technical press during the past year. Covering a wide field, ranging from canal haulage in France to the regulations with regard to motor-buses in England, and from the effect of smoke on trolley wires to a comparison of the cost of electricity supplied by borough councils and companies, it presents an interesting record of engineering progress. The section devoted to automobilism is somewhat variegated, the score of pages of which it consists giving information with regard to licences, Scotland Yard regulations for motor-buses, the formulæ for finding the speed of vehicles, the tractive effort in automobiles, a diagram showing the export of French cars, a lamp lighting table, and a list of steep hills in England. Messrs. Percival, Marshall and Co. have issued the book in a neat and handy form.

THE PLEASURES OF MOTORING.

BY CHAS. E. DURYEA.

THE owner of an up-to-date motor-vehicle is a fortunate being at this time of year. Nature seems more attractive now than at any other period, and invites all her lovers to an outing. With a light vehicle, strongly constructed and of ample power, one is prepared to go anywhere at will. Folding hoods with curtains and storm apron will protect against possible showers, but, since many roads are dusty, clothing must be suitable and linen dusters or light cloaks are practical if not picturesque. The ladies in particular should provide their hats with silk capes at the back to protect their hair from the clouds of dust behind. The average fuel tank is ample to meet all needs in most portions of the country, for petrol can be now readily obtained. Lubricating oil should be carried to avoid the bother of securing oil of suitable quality when wanted. Tools, extra small parts, and tyre repairing accessories are necessary. For long trips the necessary clothing should be carried in suit cases, strapped firmly in some convenient place. Thus equipped one has but to turn the starting handle and awaken a genie powerful, willing and tireless, beneath whose muscles of steel and tyres of rubber the landscape flits at the will of the driver.

What is more pleasant to contemplate than coasting through the world as free as a bird. A slight movement of the steering wheel determines the direction, a touch of a lever determines the speed, while a brake pedal under one's foot insures ample ability to stop the vehicle in case of emergency. No hills are too steep for the sturdy motor, and the easy sweep down an incline and across the valley, followed by the powerful, rapid and majestic climbing of the opposite hill, combine both the grace and swiftness of the swallow with the irresistibility of an avalanche. The rapid motion furnishes always a cooling breeze, regardless of the direction, and neither hills nor bad roads tire the willing vehicle. To drive rapidly when opportunity offers, to linger along in beautiful spots, to stop for fruit and flowers, to choose a quiet inn for the night, to visit mountain and seashore in rapid succession—in short, to thoroughly enjoy life—is the lot of those who are fortunate enough to spend their summer vacation in a motor vehicle.

To him who, in the love of Nature, holds
Communion with her visible forms
She speaks a various language.

Nature is never more beautiful than when seen from the seat of a motor-car. The fortunate possessor of an automobile, by his veritable independence of limitations, is more ready to perceive and able to enjoy the beauties of nature than less fortunate mortals. If he prefers the water, mile after mile of brook or river or lake floats before him like a panorama. Long springs, large tyres, and luxurious upholstering smooth the way, and the face of nature appears like a map—free from obstructions. There is no tiring of the scene, no waiting for new ones, no laborious exertion to secure the result. As if by magic, and without feelings of sympathy for the hard working horse, one glides along enjoying the beauties of nature—not on heated, noisy iron rails, not through dark smoky

tunnels, not through the roughest portions of the town, but ever on the best roads, past the finest houses, through the most beautiful parks and alongside well-kept farms. This difference in seeing a country must be tried to be appreciated. The cyclist knows something of the beauties of nature, but no one enjoys this picturesqueness so fully as the motorist. To paraphrase Milton, one may truly say—

"With thee a-riding, I forgot all time,
All seasons, and their change—all please alike."

The springtime, with its opening flowers, its green fields and newly-awakened woods with their many changes from the pink of the buds just bursting to the dark green of the evergreen; its fresh warm winds and mellow sunlight, are inviting, exhilarating, and youth-renewing. The summer, with its greater heat, makes seaside and mountain more pleasant. Its fields of waving grain, its bushes and trees loaded with luscious berries, invite one countryward on every occasion, and the motor vehicle more than any other means of transport lends itself

to the occasion. The autumn, too, has its attractions. The many-coloured leaves render each wooded hill a blaze of beauty. The good roads invite distant roving, and many a scene, inaccessible in the spring time, offers itself to view. Even winter has its attractions. With ample rugs to keep out the wind, one can defy the cold and travel far or near with pleasure. Whether over frozen roads or through the freshly fallen snow makes little difference to the motor. In many localities the snow and frost smoothen rather than roughen the surface, and sleigh riding on wheels, motor driven, surpasses the conventional kind. Here again the motor is superior to distance and horseflesh, and opens landscapes not usually enjoyed. It is ideal transportation. To think is to direct and go. The cycle is a solitary carriage. The railway and steamship carry crowds, but the motor-car, with its chosen party, brings advantages possessed by neither. One is dependent on the quality of the roadway and the exertion of its rider, the other must follow its established track, but the automobile is limited scarcely at all.

The pleasure of the pioneer and the explorer comes to the motorist who traverses a new district or visits unfrequented localities with shooting,

fishing, and picnicing grounds drifting around him. Beautiful scenes, more enjoyable because of their inaccessibility, are reached by him. His range is wonderfully increased and his pleasures enlarged accordingly. Only those who have experienced these delights can appreciate them, for to many driving behind a spirited horse is the acme of pleasure, and they cannot conceive that an inanimate mechanism may be possessed of an ability and responsiveness which yields to its driver more pleasure than that of controlling a beautiful team. As the trotter is superior to the ox, or the locomotive to the traction engine, so is the motor vehicle to its predecessors.

COL. W. B. CAPPER, the newly-appointed commandant of the Royal Military College, Sandhurst, has decided to close the roads running through the college grounds to motor traffic, except in instances where occupants of cars have business with residences situated in the grounds.

The Tour of France by a Hotchkiss Six-cylinder Car.

A MOTORIST'S RANDOM NOTES.

ARE tarred roads slippery when wet? The writer has not heard this question raised before. Those who have had experience of driving over many of the tarred roads in Kent know that under certain conditions they are dangerously greasy, and it is next to impossible to keep a straight course unless one drives slowly and with the utmost care. The writer knows of one or two stretches that after rain provide the most treacherous going that it would be possible to find and necessitate sanding so that the horses can keep their feet.

"HILLCLIMB-ITIS," to coin a new word, is the latest ailment, owners of high-powered modern cars being chiefly susceptible. First symptoms usually manifest themselves in an unconquerable craving for tackling steep gradients. Should the victim strike a very severe rise of one in three or so, and the ascent be unsuccessful, he develops a peculiar form of nervous excitement for which restoratives may be necessary. Thereafter he is content to coax and wheedle his engine into better running in order to overcome an apparently insurmountable difficulty. With untiring patience he will weigh an apparently

asked the defendant's counsel. "No," was the reply, "policemen have no time for that."

THE police are timing motorists who travel over the old Dover road across Blackheath in excess of ye legal limit of a score of miles. A century ago this was the happy hunting ground of knights of the road, and many a tale is told of their holding up the mails at this spot. The modern highwayman is likewise disguised, and awaits in concealment the approach of his victim, whom he catches by surprise, brandishing his stop-watch in lieu of a blunderbuss. He asks not for money or valuables, or a kiss from ye fayre passengers, but demands the production of ye lycence. As a result, motorists have to pay much coin of ye realm at ye local court.

"SLEEPING out on the car." Not many motorists elect to do this except through sheer necessity; yet, provided it has a fairly roomy tonneau and, preferably, a Cape hood, it is not bad fun. The writer, in company with two male companions, left Hastings one Sunday night at about eight for the sixty mile run to London. At Robertsbridge, twelve miles, the back cover burst.

Conveying an Aeroplane to the Bagatelle Testing Grounds, near Paris.

faulty carburettor float or piston ring in the balance, and, finding it wanting, will right it with his own loving hands, scorning to abandon to the care of the lucre-hunting repairer and maker that which may be accomplished out of the strength of his own true and untiring skill.

HAVING been successful in improving the running, he will again go down and confidently essay the climb. The engine will stop at the exact place as before, whereupon he will say "Bother it," or words to that effect. The operation of adjusting and tuning up will then be repeated at the foot of the hill. Another start is made, and this time the engine stops thirty-five yards lower down than before. Which reduces the question to the following problem. A motor-car + loss of power - a quarter mile of steep hill. Why didn't the motor climb the hill? Subtract the swear words from the answer, which must be reduced to printers' English, *Quod erat absurdum*.

IN a motor prosecution case at the Greenwich court a police timekeeper at a local trap, in giving evidence against a motorist, said "the road was crowded with people going to the 'Pedestrian' church (roars of laughter). 'Do you ever go to church?'"

It was not before ten that we had another cover fitted. Then commenced a series of troubles; first misfiring, due to a terminal shaking loose, and then on one of the stiff hills on this road the chain broke. To repair, minus spare links or bolts, is a heart-breaking job, especially after dark. However, a repair was made. This promptly gave out on the next hill. Another extempore bolt was made and fitted and we drove through Tunbridge as it was striking twelve, the town deserted and as silent as the grave.

THREE miles further the chain again broke, and, knowing a terrific hill was ahead, we decided not to continue. There was no inn near, so the three of us decided to make ourselves as comfortable as we could on the car, and, well wrapped up in our waterproofs, and tired out after our exertions, we slept the sleep of the just. Waking up, we found ourselves outside a cottage and the occupants already up and dressed eyeing us in open-mouthed astonishment. They kindly supplied us with some tea and something to eat, refusing payment, and a little way up the road we learnt was a blacksmith's, and here a sound repair was made to the chain, enabling us to reach our destination without further trouble after a never-to-be-forgotten night out on the car.

HINTS ON THE DRIVING AND MAINTENANCE OF DAIMLER CARS.

THE Daimler Motor Company, Ltd., have recently issued an instruction book with regard to the driving and maintenance of Daimler cars which should be found indispensable to all users of these vehicles. As there are now a considerable number of these vehicles in use, many of the owners of which may not be in possession of the pamphlet referred to, the following extracts therefrom may prove of interest.

Should there be any difficulty in starting the engine after a long run, open the two air cups on the inlet pipe, and after

The plugs should be cleaned with petrol, and the platinum points—if plugs with points be used—adjusted to give a gap of about half a millimetre. Always carry a supply of spare plugs to replace faulty ones.

If the engine stops suddenly, examine the wires to ascertain whether the terminals are all properly connected, or if there be a breakage anywhere. Also see that the trembler on the coil is working properly. To adjust the latter, gradually tighten the screw on the top until the engine gives signs of slowing down; as soon as it does so, turn the screw back again until the engine picks up speed. This will be about three or four notches, and should be the correct position of the trembler blade. The platinum contacts should be perfectly clean, and, in the event of stopping the engine, it may be found that the spring which holds

Elevation and Plan of Chassis of Daimler Car specially numbered to show the parts which require lubrication in accordance with the instructions given below.

- | | | |
|--|---|---|
| 1. Oil twice a week. | 6A. Take screw out of end. Oil once a week. | 11. Fan, lubricate every morning. |
| 2. Oil every three days | 7. Face of control brackets need a slight rubbing of grease. | 12. Turn cap of lubricator twice a week. |
| 3. Oil every morning. | 8. Grease once a week. | 13. One turn of caps every morning. |
| 4. Inject a little paraffin at least twice a week. | 9. A little oil every morning is necessary here when lubricating. | 14. Attend to grease lubrication twice a week. |
| 5. Grease every morning. | 10. Turn cap of grease lubricator twice every week. | 15. Grease every 800 miles. |
| 6. Oil once a week. | | 16. Engine control joints and brackets oil every day. |

giving four or more turns of the starting handle switch on the current, when the motor will start. Do not omit to turn off the air cups as soon as the engine is running. In the event of the motor stopping, the first thing to do is to examine the ignition. Lift the lid of the commutator box, and see that the spark given off is of a deep blue colour; if it is of a pale violet there is something wrong with the sparking plugs. To test these, disconnect the wires from the plugs and hold them at a very short distance from the terminals to see if a good spark is passing. If one of the plugs is showing a feeble spark, change it for a new one.

the contacts up to their work has weakened and needs replacing with a slightly stronger one. If the engine stops gradually, try the accumulators with a voltmeter, to ascertain that they are not run down.

If these are not in order, examine the petrol reservoir to see that the supply is not low. Observe that the mercury in the pressure gauge is at the right height, that is to say, not below the lowest mark on the gauge. Also take off the top of the float chamber of the carburettor with the tool supplied for the purpose, and see that a good supply of petrol squirts

through the hole, 12 to 18 inches, at least, high. If not, examine the petrol filter, which is found on the left-hand side of the car behind the front wheel, and close to the frame. Furthermore, examine the pressure filter over the engine, close to the pressure valve. These filters should be cleaned weekly. In case of flooding, known by leakage of petrol at the carburettor, examine the float. The minutest perforation in this will cause the float to fill with petrol and sink, and fail to cut off the supply of petrol. To ascertain whether the float itself is defective, it should be displaced in hot water, when bubbles will immediately show if a leak exists. Once a week it is necessary, without fail, to take out the plug at the bottom of the petrol tank, out of which about one pint of liquid should be allowed to run out to run off accumulation of grit, &c. Each half of the base chamber should be cleaned out after every thousand miles, disposing of the dirty oil, and refilled with about $3\frac{1}{2}$ pints to each half.

Should the power of the engine appear to diminish, after having tried all other means, examine the valves, and if they are badly marked it will be necessary to grind them in. To do this, a little flour, emery and oil is required, and the valve should be turned with a screw-driver under pressure of the arm, frequently lifting the valve from its seat to alter the position of the emery

pillar. Cups are provided on the spray pipes for the insertion of paraffin to wash out the engine. This should be done overnight whilst the motor is running. This will keep the engine clean, and it will be found to start easily next morning. When adjusting the brakes, the wheels should be "jacked" off the ground, as otherwise the braking effect cannot be rightly observed, and the engine may be called upon to propel the car with the brakes more or less on.

Wash the wheels of the car with a small quantity of paraffin in the water; the body of the car should be washed with ordinary soap and water; and, if necessary, a good body varnish can be applied. The car should always be cleaned overnight before the mud has dried on, after which it is difficult to remove it without scratching the paint. In winter, draw off all water from the radiator and engine overnight, to prevent cracking from frost. Anti-freezing solutions are doubtful remedies. The tyre companies give full instructions for repairing tyres, but, in the event of an irreparable burst, packing the outer cover well with straw will often enable one to get home. In the case of a destroyed outer cover, protect the rim by binding it with rope passed through the spokes. Then, by travelling slowly, a considerable distance may be traversed in safety.

M. Albert Clement at the wheel of the Clement-Bayard Racer for the Targa Florio Contest in Sicily.

particles, and thus ensure even grinding. The oil and the emery must be carefully removed—to its last particle—with petrol.

Keep the leather of the clutch in good condition by the application of castor oil and paraffin, applied in the following manner: once a week, at night, with a knife, apply a little castor oil to the front part of the clutch, in three or four places, and slip the clutch on the fourth speed, to ensure even distribution of the castor oil. Next morning squirt in about one tablespoonful of paraffin through the arms on the front or nose of the clutch. It will be noticed that these applications are made on the front portion of the clutch, so that the leather there remains flexible where the first contact takes place, the leather on the back part remaining comparatively hard to effect the actual driving of the car. By applying castor oil and paraffin in this manner the car will start off easily, and when the clutch is "home" it will not slip. The clutch, which should be kept free from resin and fuller's earth, is easily adjusted by tightening the long spring under the footboard; it is, however, not desirable to put on unnecessary pressure, as undue friction of the bearings results. The gearbox, axles and wheels should have attention at least every 1,000 miles. The lubricator on the dash, fully charged, should suffice for $1\frac{1}{2}$ hours. To refill, pull the chain attached to the steering

ACCORDING to reports from members of the R.A.C. who are at Biarritz, or who have just returned from that resort, the roads are in a most deplorable state after the bad weather experienced there this winter. The rain has been incessant, and, although it has recently stopped, it has left the road surface in a terrible condition. The repairing is entailing endless stretches of loose metal, and the roads are not likely to be good again until well into the summer, if then.

A DEMONSTRATION was recently given in New York with an engine running on alcohol to which a small portion of acetylene is added. It is claimed that the effect of the latter is its ignition effect on the alcohol charge, in instantly extending the flame from the point of original ignition at the sparking plug to all parts and recesses of the inside of the cylinder where the alcohol charge is under compression. The process, which is known as the Barker-White, consists of an arrangement of a carburettor, which carries atomized alcohol on its way to the motor, through a chamber having a bed of calcium carbide. The resulting product, which is a combination of air, alcohol vapour, and acetylene, is known as "alkoethine." The power developed by it is stated to be about equal to that of ordinary petrol, but at a much smaller cost.

THE Motor House, of Easton Road, N.W., are placing upon the market a new tyre, the "Garantire," the durability of which is guaranteed by the firm.

THE efforts of the Borough Development Committee have attracted a Manchester firm of motor-car constructors to Derby, to the disappointment of Leicester, which was first mentioned in this connection.

A NEW motor garage is being built in Becket Street, Wardwick, Derby, for Messrs. A. R. Atkey and Co., Ltd., of Nottingham. The new establishment will be near the St. James and Royal Hotels.

THE wedding took place in Manchester last week of Mr. F. C. Noar, of Ashton-on-Mersey, who was a prominent competitor at the last Blackpool Motor Meet. He is now on a fifteen hundred mile honeymoon tour.

THE Paddington Motor Company, Ltd., of Banister Road, Kensal Rise, W., inform us that they have acquired the agency for a German motor-cab chassis which has an improved friction drive in place of the ordinary gear-box.

MR. HENRY KINSEY, of Swansea, called upon us a few days ago with the model of a new skid-preventing device he has invented for motor-buses. The arrangement is an ingenious one and is worthy the attention of motor-bus engineers.

LAST week we reported an accident by which a man named Margerum was killed by a motor-car. The coroner's jury said no blame was attached to the driver of the vehicle, but the magistrate has since committed him for trial on a charge of manslaughter.

MOTOR visitors to Dublin will be interested in the extended provision for their convenience which Mr. J. J. Keating is providing at 3, Lower Abbey Street. The new premises will enable him to add to his facilities for the repair of vehicles as well as their storage and equipment with accessories.

MESSRS. J. GIBBON AND SON, of West Nile Street, Glasgow, have opened a new motor garage and workshop at 170, Buchanan Street, which will be known as the Central Motor Garage. Every provision will be made to enable the firm to undertake all classes of motor repairs.

COL. F. N. MAUDE, in a lecture on "Mobility," at the Royal United Service Institution, has just said that in European warfare the future belonged to that Army which could lighten the loads carried by men and horses, loading up everything on motor-transports of various kinds, fast, medium and slow.

THE North-Eastern Garages, Ltd., who have depots at Harrogate, York, Darlington, and Newcastle-on-Tyne, have taken over the premises of the Yorkshire Mutual Garages, Ltd., in Woodhouse Lane, Leeds. The garage has an excellent repair shop, and the North-Eastern Garages will keep there a first-class staff of mechanics.

FROM Messrs. Freysinger Gebruder, of the Russia Gummiwaarenfabrik, Riga, Russia, we have received a copy of a little pocket-book they have issued in celebration of the tenth anniversary of the firm. Started in 1897, the firm now employ 250 men, and produce in addition to cycle and motor tyres all classes of rubber goods.

MESSRS. WILLIAM COLE AND SONS, LTD., of High Street, Kensington, W., have sent us a couple of photographs which afford an interesting contrast. One is that of the first carriage—a light two-wheel vehicle, built in 1828—for her late Majesty Queen Victoria, and which is still to be seen at Messrs. Coles' depot. The other depicts one of their latest motor landaulet bodies, of which they are now making a speciality.

MR. CHAS. E. DURYEA, one of the pioneers of the motor movement in the United States, has within the past few years written extensively on automobile technical matters. The article which we print on another page, and which is taken from our American contemporary, "The Motor-Car," shows that he is equally at home when writing in a lighter strain, giving as he does a delightful pen picture of the pleasures of motoring.

HERE AND THERE.

ABERDARE is being provided with a new motor garage by Messrs. Parker Bros.

IN the West Street, Ewell, Surrey, Mr. Shapland has a well-equipped workshop for repair work. He has just introduced

the "Contraction" side car, which should become popular on the road during the next few months.

THE students attending the motor-car classes in connection with the Department of Applied Science of the Sheffield University have paid a visit to the works of the Humber Company, at Beeston.

MESSRS. F. E. MARRIOTT AND CO., of the Cathedral Motor and Cycle Works, Eign St., Hereford, are opening a new dépôt and garage in the Commercial Road, Hereford, where a stock of accessories and all motorists' requirements will be stored.

THE Century Motor Co. have taken fresh premises at Holland Gate, Kensington High Street, W., as garage and repair works, and when they are completed they will be carrying a stock of Clyde and Astahl cars. The premises are on an extensive scale and can comfortably accommodate 150 cars.

THE rapid progress made by the motor industry is greatly due to the courageous struggles and untiring efforts in the early days of a handful of sturdy pioneers. Associated in this group

may be found the name of Mr. J. J. Mann, who was in 1882 at the head of the technical service of the National Telephone Company at Dundee, where he invented the "circuit line" system. After doing much good work in the electrical business, he in 1894 founded the firm of Messrs. Marshall and Co., Belfast Works, Manchester, one of whose cars he drove throughout the famous 1,000 miles trial of 1900. At this stage the Continent seemed to open out more scope for the rapid extension of the

motor business, and those who know the activity of Mr. Mann cannot be surprised at his being attracted to Paris, the hub of the motor world, there to take up the position of consulting engineer to the Hotchkiss Company, where he created their well-known car. After serving three years in this capacity he was appointed general manager of their automobile department, and is to-day one of the leading men in Continental motor circles, as may be gathered from his recent election to the Racing Board of the American Automobile Club.

SPEAKING at a meeting in support of the Sunday Observance movement at Dorking, Sir Dyce Duckworth said the advent of motors was responsible for a great deal of the Sabbath breaking. Those hideous and unlovely monsters, those ugly demons, flew through space, carrying their load of people who thought they were happily spending their Sabbath, but who were nothing less than monsters of selfishness and inanity.

MISS LILIAN JOY's advice to ladies going a-motoring at Easter gives special interest to the current issue of "The Queen." "It would," she says, "be most unwise to go away without one's very thickest fur-lined coat. Even should there be a welcome change to a warmer temperature, it is just as well to wear an extra wrap under one's new and lighter weight coat at first. This can take the form of a long-leaved spencer in wash leather, or one of those excellent arrangements made of knitted wool and lined with silk, now to be found in the establishments of all who cater for the lady motorist."

SIR CHARLES SAWLE has recently placed an order with the Daimler Company for a 30-h.p. Milverton model car.

FIAT MOTORS, LIMITED, have just delivered from their works in Turin a 30-40-h.p. Fiat car with limousine body by Messrs. Rothschild et Fils, to the Right Hon. the Earl of Rosebery, P.C.

THE Duke of Portland, Sir George Meyrick, Bart., Mr. J. M. Fuller, M.P., and Professor W. Watson have been elected to membership of the Royal A.C.

M. DESPONT, of Levallois-Perret, has a novelty in an auto-signal, which consists of a glass sign set in the back of the car, which when lit up by a small electric lamp controlled by a switch on the steering wheel shows the word "Stop," thus announcing to the driver of any following vehicle that the car is about to be pulled up.

LICENCES and badges will be issued from Monday next onwards by the Commissioners of Works for the admission of electric carriages to Hyde Park between the hours of 4 p.m. and 7 p.m. in the months of May, June, and July. Forms of application may be obtained, by letter only, from the Secretary, His Majesty's Office of Works, &c., Storey's Gate, Westminster, S.W.

AMONGST the numerous puncturing objects we have come across that a Palmer Cord Tyre has resisted is a nail from the wheel of a farmer's cart, as shown in the accompanying illustration. This nail was picked up by a Palmer Cord Tyre and carried for many miles, but the cord foundation effectually resisted the formidable object, which was worn down almost as sharp as a chisel at one end. The nail was turned aside without damaging the cords.

MR. HENRY MOORE, of Brighton, has had an experience with a hen and a motor-car. While he was on a tour through Sussex lanes last week a fowl ran in front of his car, and as the bird did not reappear he stopped the car after going fifty yards, and found her securely hung up with one wing over the steering rod. She was unhurt, and ran home at top speed as soon as released.

MR. F. W. H. HUTCHINSON, of "Ilmington," Manor Road, St. Albans, will be glad to hear from anyone of means interested in aeronautics, with a view to continue experiments with the Frost and Hutchinson flying machine,

which has wings constructed of artificial feathers arranged anatomically and mechanically on the principle of the natural bird's wing. The machine has already been worked under power.

WE have received a copy of a work entitled "The Making of an Automobilist," by H. A. Grant, and published by the Auto Instruct Publishing Company, New York. As may be inferred from the title, it is intended for novices in motor matters, and to furnish that information on the care and handling of automobiles which every driver should possess. The subject is generally well handled, and the book contains a good deal of useful information in condensed form, the various types of motors, petrol, steam, and electric, being dealt with, as well as carburettors, transmission, lubrication, &c. The book also contains a list of automobile terms and their equivalents in French, German and Spanish. This, however, is not its best feature, as many of the foreign equivalents given are incorrect. For instance, "cheville à étincelle" is mentioned as the French equivalent of the term sparking plug, instead of a "bougie," and the Germans, following the French, say Zündkerze, instead of Funken-Stoppsel. The book also contains chapters on Automobile Material and Construction, by Mr. J. D. Maxwell; the Cooling of Explosive Motors, by Mr. F. Briscoe; Tyres and Tyre Construction, by Mr. H. de Lisser, and the Importance of Oiling an Automobile, by Mr. C. W. Kelsey.

THE new motor house premises of the Royal A.C. are in Blackman's Yard, Brick Street, London, W.

MESSRS. GLASEBROOK, EBBLEWHITE, GRIFFIN, STRAIGHT-DUTTON, URRY, and WHEELWRIGHT have been appointed time-keepers of the Royal A.C. for 1907, subject to their compliance with the terms of the competition rules of the Club.

ONE of the four-cylinder engines of the Packard Motor-Car Company, Detroit, U.S.A., was recently submitted to a non-stop test. It was direct connected to a 10-kilowatt dynamo, giving 40 amperes and 225 volts, the normal speed being 735 revolutions per minute. The motor had previously made several runs of 300 hours without a stop, when making tests of lubricating oil, but on the record occasion it ran for no less than 792 hours, and then only stopped because of a broken ignition wire.

A MAGNIFICENT motor trophy has been subscribed for by the city of Hereford for the hill climbing competitions, to be held at Frome's Hill in May next. The trophy stands three feet high, on an ebony plinth, with highly-finished chased work in silver. In the foreground of the plinth is a relief of a motor-car, with figures, and underneath are silver block letters: "Motor Trophy, City of Hereford." On the obverse side of the plinth is a fine piece of chasing, showing two of the principal products of Herefordshire—hops and apples. The weight of the trophy is over three hundred ounces.

CRAVENS, LIMITED, railway carriage and wagon builders, of Darnall, Sheffield, have lately opened a large and well-equipped motor-car garage and repair shop at Darnall, Sheffield. The floor area of the premises is 11,850 square feet, and there are two entrances direct from Staniforth Road. Inspection pits are provided, as well as overhead hoisting appliances; plant has been put down to enable repairs of all kinds to be undertaken, and compressed air laid on in pipes through the building, so that tyres can be inflated instantly with a minimum of trouble. A private track of over one-third mile per circuit is also in course of construction, which is to be used for teaching beginners to drive, and for testing the running of cars when required, with absolute freedom from traffic risks.

CEYLON is daily becoming better known as a tourist resort and every year the number of English people who spend the winter in the island instead of in Egypt is rapidly increasing. Last year the number of tourists—chiefly English and American—who visited the island was unprecedented, and the hotel accommodation was found inadequate. Nearly all the motorists in the island are members of the Ceylon Automobile Club—a body which keeps the authorities alive to their responsibility as to the condition of the roads. It took a prominent part in the agitation against the tolls. At present it is endeavouring to obtain legislation for dealing with pariah dogs and stray cattle, which are the motorists' greatest annoyances. There are practically no restrictions as to speed or mode of travelling except within the municipal limits, where speed maximums have been fixed, and the prosecution of motorists is almost unknown.

MESSRS. JOHN WILEY AND SONS, New York, and Messrs. Chapman and Hall, Ltd., London, have just published a little book which will be found extremely useful by all engaged in giving instruction to would-be motorists and motor-car drivers. It is entitled "The Complete Automobile Instructor," and comprises over six hundred questions, with answers and illustrations, covering the principle, operation, and the care of petrol cars. The work is from the pen of Mr. Benjamin R. Tillson, who is head of an automobile school in the United States. About forty pages are devoted to the questions, which are arranged under twenty-two different headings, while the answers occupy no less than 150 pages, a handy index forming the concluding portion. The author, being an American, employs many terms which are used in his country, but which are expressed by others in England. For instance—to take the two examples we notice as we write—"missing" is referred to as "skipping" and the "earth connection" as the "ground" connection; gasoline, too, is of course employed throughout with the English meaning of petrol. Having these differences in mind, however, motor-car instructors in this country should find Mr. Tillson's book a useful production.

CONTINENTAL NOTES.

Speed Trials in Italy.

A series of flying kilometre and five kilometre speed trials for racing and touring cars was run off near Verona on the 19th inst. In the racing category victory in both trials fell to Count Soldatercow, an attaché of the Russian Embassy, who on his 100-h.p. Brasier covered the kilometre in 26 2-5 sec. and the five kilometres in 2 min. 10 2-5 sec., Trucio on an 120-h.p. Isotta-Fraschini being the second in the last-named event in 2 min. 18 4-5 sec. In the touring car class, a Junior car driven by Tocanier won in the under £400 class in both trials, his times being respectively 45 2-5 sec. and 3 min. 39 3-5 sec. In the £500 category, the best times, 50 sec. and 4 min. 1 1-5 sec., were made by Pellandini on a Rapid. A Junior car won in the under £800 division (35 1-5 sec. and 2 min. 40 4-5 sec.) and in the over £800 class, a Züst was first in the flying kilometre (34 3-5 sec.) and an Itala in the five kilometres (2 min. 47 3-5 sec.)

Non-Skid Tyre and Band Patents.

A considerable stir has been made in French motor trade circles owing to the action of the Samson Company, which is enforcing its patent rights in steel-studded leather tyre covers and bands. Stocks of these both in the hands of makers and agents have been seized, and even motorists have been warned of using such non-skids, the Samson Company claiming that they are an infringement of their patent.

An Exhibition in St. Petersburg.

The development of automobilism in Russia is likely to be greatly encouraged by the action of the Automobile Club of Russia in organising its first International Motor Exhibition in St. Petersburg. The President of that club has written to the Royal Automobile Club, stating that a "Committee of Honour" is being formed, and asking the Club to nominate three members to it. M. G. Lefevre, of "L'Auto," 10, Faubourg Montmartre, Paris, is the Russian Club's sole representative for non-Russian exhibits, and is in a position to give all details to those who desire them. The exhibition will run from June 1st to June 17th, and all applications for space should be sent to M. Lefevre before the 31st inst.

The Nice Automobile Meeting.

The annual automobile meeting at Nice, which has been held during the past week, opened on the 20th inst. with the speed trials known as the "Kilometre Bull's Eye." The cars were divided into a number of classes, for which a certain time was given for the flying kilometre, the winner being the driver who succeeded in most closely approaching the allotted allowance. In the first class (allowance for kilometre, 45 secs., equal to a speed of 50 miles per hour), there were thirteen starters, victory falling to Mr. Vuillaume, who on a C.G.V. car occupied the exact time, the others varying from 37 1-5 secs. to 47 1-5 secs. In the second class 55 secs. were allowed for the kilometre (equal to 40 miles per hour), the nearest to this (54 1-5 secs.) being made by M. Carmieu on a Peugeot. The time allowance for the third class was 65 secs. (34½ kilometres per hour), the event resulting in a dead heat between M. Goudoin on a Panhard, and the Marquis d'Albufera on a Renault, 65 1-5 secs. On Friday, the 22nd inst., about a score of cars took part in a run from Nice to Draguignan and back, while on Saturday last a motor paper-chase was indulged in.

The Dieppe Meeting.

It was at first proposed to hold the A.C.F. Grand Prix and Commission Sportive Cup races on separate days, but, owing to the paucity of entries for the latter, it was decided that both events should take place on one day. The authorities at Dieppe were somewhat disappointed at this, as they had looked for a two days' meeting; it has consequently been resolved to hold a series of motor-boat races as well as a demonstration of flying machines on the day following the automobile race.

The Circuit des Ardennes.

At a meeting of the Sports Committee of the Belgian Automobile Club last week it was decided that the Circuit des Ardennes race shall this year be held on July 29th, over what is known as the Small Ardennes Circuit, seven laps having to be made to give a total of 600 kilometres. The contest will be open for vehicles having a total cylinder capacity of not more than eight litres, and weighing, with racing body and tyres, at least 1,175 kil. Builders of motor-cars may enter three vehicles each, the entry fee being £100 per car up to May 15th, and £160 from that date to July 1. The Sports Committee of the A.C.B. will supply the necessary petrol (690 deg.), and the use of wheels with detachable rims will be permitted.

Miscellaneous Items.

An automobile club is being formed at St. Malo, France.—A company has just been formed at Vittoria, Spain, to manufacture cars on the Darracq system in that country.—The King of Sweden has just acquired a 40-h.p. Benz car.—

The photograph from which the above striking illustration is reproduced was taken at the Spital of Glenshee on Tuesday last week, when the 40-h.p. Siddley Car at present undergoing a long distance Reliability Trial by the Royal Automobile Club was fighting its way through a snowdrift 25 ft. deep. The official observer finally decided that further progress could not be made, and took the car back to Dundee. At one time there were nearly 100 men working with shovels clearing the cutting, as shown in the picture. The car has now done over 5,000 miles with only one involuntary stop.

M. Dewandre, chief director of the Germain Works, and Capt. Masui, Agent-General for Germain Cars in Great Britain, accompanied by Perpere (who will drive one of the Germain cars in the Grand Prix race) have just started for Dieppe on a Germain chainless touring car for a run round the course in order to make garage arrangements, &c., for the race in question.—Motor-cabs fitted with taximeters are now being introduced into Prague and Vienna.—The Automobile Clubs of Milan and Genoa propose to hold a competition for touring cars on the 9th and 10th May inst., the distance to be covered being about 1,000 kilometres.—A public motor-car service has just been established between Meru and Val-Dampierre (Oise), France. The distance is 13 kilometres and the vehicles are of the Darracq-Serpollet type.—The Renault racers for the Grand Prix event are now being tested on the road.—M. Van Marcke, who is making a 10,000 kilometres tour of France on a Hotchkiss six-cylinder car, reached Bayeux on Sunday last. During the past week he has visited Nantes, Brest, Laval, Coutances, and Cherbourg. Altogether he has now covered about 6,300 kilometres.

[Letters to the Editor should be addressed to the offices,
27-28, Charing Cross Road, W.C.]

WIRE OR WOODEN WHEELS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—This controversy seems to be something of a hardy-annual, or is it a biennial? Anyway, I seem to have a recollection of previous discussions on the subject, and equally without arriving at any definite conclusion. Probably, as usual, there is something to be said on both sides, and appearance and personal predilection must not be entirely ignored. If the wire wheel be stronger laterally, as no doubt it is when new, it has disadvantages in continued use. In the first place, there is the effect of constantly repeated changes of temperature to be considered. The wood wheel may shrink and swell with damp and heat, but this has only the effect of slightly bruising the wood rim, and of causing the spokes to "work." In an average light-car wheel properly looked after this is scarcely apparent, and anyway it does not distort the

The Badgered Scout.

Mr. Tom Browne's humorous sketch of the A.A. patrol's difficulties if motor clubs and societies continue to copy the Automobile Association's original idea of displaying a badge on members' cars.

wheel. In the case of a wire wheel, however, where the spokes are all tightly stretched (not half of them in compression as H.B.D. seems to argue!) to practically the same degree of tension, who can say what the result will be after a few months of repeated expansion and contraction due to changes of temperature? The fact of the spokes being "out of tune," as they nearly always are after a few months' use, means that the tension of the several spokes is unequal, and this in turn argues unequal stresses in the wheel, which may lead to the rim and tyre being out of truth, with results which it is unnecessary to remark upon.

So far as the side strains are concerned, the usual wood wheel of artillery type is not so strong for the same size of spoke and rim as the tangent wheel which has lately been introduced, where the spokes, although tangential to the hub, are in compression combined with a slight amount of bending strain. The weakness of the usual type lies in the tang of the spoke where it is reduced to enter the rim, but in the tangent wheel the spoke is full width from end to end, and therefore stronger. Where solid rubber tyres are used this wheel would appear to possess a further advantage over either of the ordinary types in respect of resiliency. Where very light cars are concerned there is really very little to choose between wire wheels and radial or tangent spoke wood wheels, but where the wheels have to carry considerable weight, or to transmit high powers, I, personally, should prefer the wood wheels, and

of the two the tangent type, since it is mechanically better adapted to convey the power from axle or chain ring to the rim and tyre where it is ultimately used. These tangent wheels, by the way (unlike the wire crossed tangent), present a curious problem in respect of the direction in which they should be driven, though I am inclined to agree with the makers that it makes no difference.—Yours truly,

G. LAW.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A letter under the above heading appeared in a recent issue of the *M.C.J.* from the proprietors of The Motor House. We are at a disadvantage in not having Mr. S. F. Edge's letter before us; nor have we seen the newly-designed wheel of Messrs. Easton and Jones, but as the oldest and most experienced wood wheel builders in the trade, and having had some scores of patent motor wheels through our hands for manufacture or inspection during the last few years, we feel it only just to ourselves to ventilate our opinion through your valuable medium. The reason why a wood wheel has proved unsatisfactory in many cases for motor-cars is due to the faulty material and inexperienced workmanship that are put into them. Providing the wheel is scientifically constructed and of the best, most suitable, thoroughly seasoned, and selected material, we give it as our deliberate opinion that it will withstand better than any other type the side strains which are the greatest weakness the wheel builder has to contend against.—Yours truly,

SMITH, PARFREY AND CO., LTD.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—You will remember that recently I put forward the advantages of wire v. wood wheels. I wrote to a great many users of Napier cars amongst others, and after carefully reading all the letters received in reply, I find that 40.9 per cent. have replied in favour of wire wheels, 43.8 per cent. in favour of wood, and 10.3 per cent. are doubtful and have no serious opinion on the matter. It is, however, quite clear to me that a very large section of the motoring public, and I think probably the largest section, are still greatly in favour of wood wheels, chiefly on account of appearance. It is rather interesting to record the public opinion on this point at the moment to see whether custom will ever enable one to face the more mechanical modern wire wheel, in place of the wood one, for the use of all motor-cars.—Yours truly,

S. F. EDGE.

ARE CARS TOO COMPLICATED?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The point that seems most debated is the number of pedals, levers, &c., on a car. Personally I consider the use of these devices becomes a second nature, and one does not often hear of a driver using his brake to change gear or putting in his reverse to stop the car. What I mean is, that all these levers and pedals have not to be operated at once, and a driver, when taking one of these too-complicated cars in traffic, should previously thoroughly acquaint himself with the "stopping apparatus" and practise at imaginary obstacles under different conditions, as it is assuredly better to take it out of the car than out of the community at large.

Automatically advanced and retarded ignition is, of course, a step in the right direction, but I believe a reliable and sufficiently sensitive governor which acts on the gas supply, and can be cut out, appeals more to the average motorist on the score of petrol consumption.—Yours truly,

H. J. C.

PROVINCIAL SHOWS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Now that the winter is nearly over and all the provincial shows have closed their doors, I may usefully, and without suggestion of prejudice, draw attention to a grievance from which the trade has begun to suffer. Because a town has two or three motor agents why should it have a motor exhibition? And yet many of the minor displays seem to have been based solely on an affirmative answer to that question. There is no need for such exhibitions from the educational or commercial point of view, and makers would be well advised to leave alone the provincial exhibitions that occur, without rhyme or reason, to add to their expenses without contributing to their profits. Manchester and Glasgow are, of course, exceptional places in this respect, but why attempts should have been made to organise exhibitions for Plymouth, Burslem, Norwich, York, Lincoln and Bristol passes the comprehension of yours truly,

AN AGENT.

THE FLEXIBILITY TRIAL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. Hollands, in his letter in your last issue, practically announces to a mystified world that there is, for the purposes of a flexibility competition, no difference between three speeds and four. Mr. Hollands pokes fun at Mr. Letts' imagination: but behind Mr. Letts' imagination there are the following facts:—A car with four

speeds will, *ceteris paribus*, be higher geared on its top than a car with three; further, its third is likely to be considerably lower than the top of the three-speed car. The three-speed car will thus lose a possible increase of speed which it might attain by the use of an extra gear. What, then, is the advantage to counterbalance this loss? It is the greater flexibility; and this is gained by the use of a top speed which is a compromise between the third and the fourth speeds of the other car. The "three-speeder" thus sacrifices something in possible speed and gains the very quality required in Mr. Hollands' competition.

No doubt Mr. Hollands' energy and good intentions are even greater than Mr. Letts' imagination; but that latter quality is also useful and prevents Mr. Letts from entering four-speed cars, in spite even of the delightful invitation drive "on your third," against cars fitted with a "compromise top."—Yours truly,

ALEXANDER SHAW.

PROGRESSIVE CHANGE-SPEED GEAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Mr. R. Hannen's letter in the *M.C.J.* of the 23rd inst., we have no doubt that many of your readers have seen the patent progressive speed gear in question, for it has been exhibited at the Paris Automobile Salon every year for the last four years.

If it is such a perfect device as Mr. Hannen seemed to think, is it not rather extraordinary that in the four years it has been on the French and other markets it should not have been more generally adopted?

What the device in question reduces itself to is merely a belt drive with variable pulley diameters. A great many of the motor-cars designed seven and eight years ago were belt driven, but there are not many so propelled to-day.

Without knowing the name of the prophet who assured Mr. Hannen that the epicyclic gear could not be "reliable on even moderately power-

TOURING IN THE AUSTRIAN TYROL.

GATE CONTROL OF CHANGE-SPEED GEARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—One of the most noticeable features of change-speed gears at the present time is the lack of uniformity in the design of the "gate." In some cars the reverse notch is on the outside, and in others on the inside. Again, the top speed is sometimes arranged to be in mesh when the lever is in the rear position, and in others when towards the front. A few manufacturers are taking the wise precaution of lettering or numbering the notches in the gate, so that there may be no mistake in changing gear. I venture to suggest, however, that it would be a good thing if a standard pattern of gate, in which the notches were all uniformly arranged, could be adopted.—Yours truly,

C. HAWES.

ful cars," I cannot, of course, question his authority, but I am prepared to take him out on my 40-h.p. Adams-Eight, and to give him an ocular proof that the contrary to his prophet's assurance is the truth.—Yours truly,

H. L. SMITH.

OFFICIAL INSPECTION OF NEW MODELS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In view of the terrible accidents that we read of from time to time caused by faulty steering gear or insufficient brake power, might I suggest that either the Automobile Club or the Press, or both, take up the matter with the powers that be and see if they would not con-

sent to institute a system of inspection of each new model of car as is done by L'Ingenieur des Mines in France. Although a French idea, it appears to be a very good one, and might be adopted, perhaps, with certain modifications naturally, to meet the conditions in force in this country. I am sending you a photo of a certificate issued by L'Ingenieur en Chef des Mines, which will show you what I mean. The articles two to six referred to deal with the efficiency of brakes, &c. I shall be glad to hear that my suggestion is favorably received.—Yours truly,

THOMAS CHAS. PULLINGER.

[As Mr. Pullinger points out, in France all new models have to be submitted to the inspection of the authorities, who before issuing the *procès verbal de reception* make careful enquiry into the design and construction of the various parts, such as the steering gear, brakes, &c. It is the practice afterwards for the makers to deliver to clients with any cars made on that model a *certificat de conformité*. Our correspondent's suggestion is one that is well worthy of the consideration of the Technical Committee of the Royal Automobile Club.]

AUTOMATICALLY ADVANCED AND RETARDED IGNITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It was with great interest that I read Mr. Pickering's letter in the *M.C.J.* of the 16th inst. re automatically advanced and retarded ignition. I may say that I have for some considerable time been driving a 16-20-h.p. car fitted with Simms-Bosch high tension magneto, not con-

Mr. John Polkey, of Birmingham, at the wheel of his 10-12-h.p. Coventry Humber Car, fitted with his convertible—electric, paraffin and acetylene—headlights.

trolled with advance levers, but screwed up in its most advanced position. This arrangement on the Chenard cars is perfectly satisfactory, the engine giving a very great range of flexibility, and even when running at slow speeds there is not the slightest trace of knocking. The explanation I believe is that the faster the engine runs the hotter the spark the magneto gives, consequently more rapid combustion of the gases.—Yours truly,

C. H. PICKFORD.

SUBSTITUTE FOR PETROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am very much interested in fuels and shall be pleased if you will give me some information on the under-mentioned matters:—(1) Can alcohol be used in the form of commercial methylated spirits? If so, is it possible to catch fire in the tank, and if it did fire would it explode? (2) Can commercial naphtha act as a fuel? If so, would this product explode if tank caught fire? (3) Would an equal quantity of methylated spirit and naphtha act as a fuel? Could this explode if tank on fire? (4) Is Borneo spirit as explosive as petrol if the tank is on fire? (5) Will common kerosene or paraffin act as a fuel? And if so, does the soot choke up the valves of the engine and injure it? Of course, start on petrol to get warm—that is by injecting petrol by a common oilcan, not a special arrangement of two tanks to get well started with petrol, shut off and run on paraffin. I mean, fill tank with paraffin, squirt in petrol to start engine, and—what is result? (6) Would a mixture of one part petrol to nine parts paraffin work better? If tank fired, could this explode? I should think that so small a quantity of petrol to paraffin would hardly flame if a match was put to it. (7) If any of the above fuels are possible to use, would the same carburettor do for all?

I have a De Dion petrol engine, but should like to use some less dangerous fuel. Smoke, fumes and smell I don't mind in the least. I simply use the car as a runabout on flat country, and speed is not sought after in any way. Putting aside all danger of explosion from petrol fumes or vapour arising and mixing with air in a building—one can be careful of this in storage, &c.—it is the thought that one is sitting over a tank which, it

seems to me, is possible to explode at any moment. Its all very well makers saying they use all precautions, but if petrol in a tank will violently explode if on fire, then they have lessened the chances and that is all there is in it, but the possibility of an explosion is still there.

As you may have noted before this, I am no friend to petrol or its kindred spirits. If a tank can only catch fire and burn out without exploding violently, then I don't care; one can then get off the car of one's own accord and not be blown off.

This is a lengthy letter, which please excuse. I am like a great many more novices, seeking a safe fuel that can be used on a petrol engine without altering the construction, and I shall be thankful for any information you or any of your readers may kindly give me.—Yours truly,

CAVE PETROLEUM.

[It is evident that "Cave Petroleum" has a somewhat exaggerated notion of the chance of being one day blown up when seated over a tank containing petrol, and whilst, to a great extent, his fears of the danger of this spirit are well founded, as regards a possible blaze happening one day through carelessness, the risk of such an explosion as he fears is exceedingly remote. There is a safety device on the principle of the miner's lamp, which can be easily fitted to any tank, that enables a lighted match to be applied to the open hole of the filler without danger. There are objections to the use of the substitutes and mixtures he mentions, and in any case his carburettor, now adjusted for petrol, would require more or less alteration to work satisfactorily with any fuel of a different specific gravity. Alcohol could be used, although not in the form of methylated spirit, but with probably less power and more trouble in starting, besides the risk of corrosion of his engine. It is, however, much safer than petrol. Commercial naphtha would foul up the engine in no time. Any of the fuels he mentions will of course explode if their vapour is mixed with air in explosive proportions, but the risk of these proportions obtaining in a tank or elsewhere diminish as the flash point is raised. "Cave Petroleum" might experiment with more or less satisfactory results with kerosene to which a little petrol is freshly added, but he will have to start on petrol and arrange to hot jacket the mixing chamber and perhaps the induction pipe.]

THE LIFE OF TYRES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be very glad of the opinion of my brother motorists as to how long a pair of 750 by 85 mm. tyres, extra thick, should last on the front wheels of a car weighing about 14 cwt. The makers of the car put these larger and thicker tyres on at my request.

The car ran from January 1st till about the middle of February (about ten miles a day) on good roads, in the Midlands. The roads were being repaired with 1½ in. Leicester granite.

After two weeks' wear I had to vulcanise about twenty cuts in each tyre. By the middle of February the tyres were absolutely useless and the canvas cut right through in places.—Yours truly,

IGNORAMUS.

REMODELLING AN OLD CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have an 8-h.p. 3-cylinder Duryea car, with low tension magneto ignition and radiators situated on the side of the body. The crank cases are made of copper, and there is only one brake, which actuates on the rear sprocket. I am contemplating having the following alterations done, but before doing so shall be pleased to know if you approve. Displacing old radiators, and fitting a combined tank with radiators (thermo syphon cooling) on the front of car. There is a considerable quantity of lubricating oil leaks out of the crank cases, which fit rather loosely. What could I have done to stop leakage? Having two more brakes fitted on rear wheels. Would this entail much alteration? The consumption of petrol is rather heavy. Would the engine work as well on paraffin? What would be the drawbacks, if any? I should have to get a special carburettor. What make would you recommend, to start cold. Should I experience any difficulty in starting engine on paraffin alone? With the ignition being low-tension magneto, the combustion, when using paraffin, would, I think, be more perfect. If any readers who have had similar alterations made would kindly give their opinions I should be obliged.—Yours truly,

H. W. SMITH.

[From a commercial point of view, the less money our correspondent expends on remodelling his 8-h.p. car, the better; but if it is partly with a view of gaining experience, it is a different matter. He does not say why he wishes to alter the radiators, but unless those now fitted are distinctly inefficient, we cannot advise him to go to the expense of new ones. The leaking oil from the crank cases should certainly receive attention, and, as they are only of sheet metal he might rivet some strips of close felt along the joints. The cheapest and simplest form of auxiliary brakes to the rear wheels would be the old-fashioned spoon type, to grip the tyres, and, assuming that the present brake is sufficient for general use, a well-fitted tyre brake on a little light car like the one in question should be sufficient as auxiliary. To fit brake drums and bands, either internal or external type, would be a costly job. We would not recommend our correspondent to try paraffin on this motor, as the top of the combustion head is left

unjacketed, and the total amount of jacketing is too small to be satisfactory for using heavy fuel. It is well known to those who have had experience with paraffin, that extra attention must be paid to the perfect jacketing of the combustion head and valve pockets; and even then, with all precautions taken, the compression has to be kept lower than is necessary with petrol, or otherwise premature ignition and knocking will result. We should advise Mr. Smith to try and reduce his fuel bill by experimenting with the carburettor in conjunction with 760 deg. spirit. He might also see that the timing of the valves is set to the best advantage.]

NON-FREEZING ENGINE COOLING SOLUTIONS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In connection with the correspondence on the above subject, I have made some experiments along this line, and as the results in the form of data will, in all probability, be of value to owners of cars, I give them below. The fluids recommended are solutions of calcium chloride, glycerine and wood alcohol. I made a 10, 15, 20, and 25 per cent. solution of each of these and determined their freezing point, with the following result:

Calcium chloride—Ten per cent. solution freezes at 15 deg. above zero F.
Calcium chloride—Fifteen per cent. solution freezes at 5 deg. above zero F.
Calcium chloride—Twenty per cent. solution freezes at zero F.
Wood alcohol—Ten per cent. solution freezes at 15 deg. above zero F.
Wood alcohol—Fifteen per cent. solution freezes at 5 deg. above zero F.
Wood alcohol—Twenty-five per cent. solution freezes at zero F.
Glycerine—Ten per cent. solution freezes at 20 deg. above zero F.

The Flexibility Trial.—The Napier Car going up River Hill on top gear.

Glycerine—Fifteen per cent. solution freezes at 15 deg. above zero F.

Glycerine—Twenty per cent. solution freezes at 8 deg. above zero F.

Glycerine—Twenty-five per cent. solution freezes at 5 deg. above zero F.

Zero Fahrenheit was the lowest point I could reach with my freezing mixture. This is, I believe, low enough for practical purposes, as these higher percentage solutions freeze mushy, and not solid. They would not, therefore, in my judgment, expand enough to burst the parts if they did freeze in the machine. I use in my car a mixture of one part each of wood alcohol and glycerine and two parts water. I do not believe that this will freeze above 10 degrees below zero. A 25 per cent. solution of calcium chloride stands the lowest temperature, but is objectionable, as it is likely to corrode the parts with which it comes in contact. Wood alcohol will evaporate by the heat of the engine and more must be added at intervals. Both glycerine and wood alcohol are likely to soften rubber connections after a time, but this would be a small matter.—Yours truly,

C. F. NIXON.

WATERPROOF APRON.—A motorist passing through Sale (Cheshire) recently lost a waterproof apron, informing a local policeman of his loss, and handing him, evidently in mistake, the card of Mr. G. W. Hodgkinson, motor engineer, of Buxton, instead of his own. If the owner of the apron will communicate with Inspector G. E. Farnworth, Police Station, Sale, Cheshire, he will secure the recovery of his property.

CLUBS AND ASSOCIATIONS.

AUTOMOBILE ASSOCIATION.

THE fortnightly committee meeting of the Automobile Association was held last week. New members to the number of eighty-two were elected, among them being the Marquis of Downshire, the Earl of Radnor, Sir William Abdy, Bt., Sir Home Gordon, Bt., the Hon. Mrs. Hylton Philipson, the Hon. Lionel Holland, Colonel Dick, Col. R. Williams and Mr. C. B. Balfour, M.P. The secretary reported that the income is being increased at the average rate of one hundred pounds a week, a striking evidence of progress. A contract for a large supply of village signs was formally confirmed by the meeting.

It was decided that patrols shall be on duty all through the Easter holidays, and that the roads from London to Liverpool, Leeds to Liverpool, and Sheffield to Liverpool shall be specially organised for service both before and after the Tourist Trophy Races.

ROYAL AUTOMOBILE CLUB.

THE formula under which cars will be admitted in the "Graphic" Challenge Trophy Race is as follows:—Cylinder diameter in inches squared, multiplied by the number of cylinders, must not exceed 125. The contest will take place in the Isle of Man and probably on

Slien Lewaigne Hill, near Ramsey. The length as from Balline Bridge (electric railway crossing) to the public-house "Rest and be Thankful" is about 2,550 yards, and the gradient between these places is 424 feet. The steepest part is about half a mile before the "Rest and be Thankful" is reached and is one in twelve. The formula given above does not apply to steam cars.

The road test in the Vapour Emission Competition consisted of a run of about 150 miles along the Coventry road, as far as Daventry, lunch being taken on the return journey at Towcester, 61½ miles from London. Each of the twelve cars carried a judge as observer, and each car travelled with the gas analysis apparatus attached.

At a recent examination at Plymouth, twenty soldiers were examined for the driving certificate. An examination will be held at the Great Northern Hotel, Lincoln, on Saturday, April 13th, by arrangement with Mr. Godfrey Lowe, hon. secretary of the Lincolnshire Automobile Club.

THE MOTOR UNION.

THE March meeting of the General Committee of the Motor Union was held at St. Ermin's Hotel, Westminster, S.W. Mr. C. D. Rose, M.P., was unanimously elected chairman of the Union, in succession to the Hon. Arthur Stanley, M.P., who was elected a Vice-President.

The following gentlemen were elected vice-chairmen of the Union.—Col. R. E. Crompton, C.B., R.E., Captain D. Hughes Morgan (South Wales), Captain H. S. Streatfeild (Sunderland), Mr. G. T. Langridge (London), and Mr. C. H. Dodd (Reading).

A cordial invitation was read from the Liverpool A.C. for the Union to visit Southport on July 20th and accepted. Twenty-five applications for legal advice and information were dealt with, and a financial grant was made towards the costs of a medical member in resisting a special rate for water used for washing a car charged by the Harrogate Corporation.

The badge for attaching to cars—the mark of the considerate driver—was approved and its issue to the members sanctioned.

The Highways Protection Committee of the Union reported the result of their inquiries as to the covered van, and it was resolved that further action should be taken with a view to securing the general adoption of a bye-law to lessen the public danger that exists through the use of the hooded van so constructed that the driver cannot see the overtaking traffic.

Two prizes of eight guineas and four guineas respectively are offered by the Union for the best design of an almanac. The almanac is not to exceed 24 in. by 17½ in. in size, and must be designed for printing in not more than three colours. May 2nd is the latest date for the submission of designs.

THE annual general meeting of the Motor Union was held on the 20th inst., at the St. Ermin's Hotel, Westminster, S.W. The Hon. Arthur Stanley, M.P., presided. Members of the Union were present from London, Liverpool, Birmingham, Manchester, Nottingham, Leicester, Derby, Sheffield, Cardiff, Ipswich, Cheltenham, Epsom, Horsham, Coventry, Reading, Bromley, Tunbridge Wells, Watford, Chichester, Darlington, Oxford, Burton-on-Trent, Reckenhall, Accrington, Hitchin, Berkhamsted, Farnham, Richmond, Brighton, Lincoln, Godalming, Conington, Uxbridge, Maidenhead, Bushey, Barnsley, St. Neots, Pembroke, Reigate, Butler's Cross, Royston, Chatham, Portsmouth, Stevenage, Paisley, and other places.

After the formal business had been disposed of the chairman made an interesting speech, from which the following excerpts are taken:—During the year twenty-four new clubs joined the Union, and the membership increased by 3,527. The membership of provincial clubs advanced from 5,199 to 6,907, an increase of 1,708. The individual members of the Union have increased by 1,000. At the present time the Union includes eighty-eight clubs, and it has an aggregate membership of 14,792. During the year the agreement with the Royal Automobile Club has been in force, and it has worked even more smoothly than the most sanguine expectations led us to hope. We set up a Standing Joint Committee, having before our minds the possibility that there might be differences over the agreement. This year the provincial meetings take place in May at Lincoln, in July at Southport, and in September at Leicester. With regard to the Southport meeting, I have to remark that whenever I have come among you the members of the Union have always been good enough to make me feel at home. I hope I shall be able to repay some little part of that debt with my father's leave when you visit us at Knowsley on the occasion of the Southport meeting. As regards the legislative outlook, I think the least said about it the better. My friend Mr. Rose will agree with me that neither we nor anybody else are thirsting for legislation. I don't think we should press for it for this reason. The next Bill dealing with the matter will not be a temporary Bill, as the present Act is, but will be a permanent Act. There is no doubt that every year the movement grows with enormous strides, every year our chances of getting a good Bill such as we would wish are improved. Passing on, I come to the legal work of the Motor Union, which, of course, has been very important. The scheme for the appointment of solicitors in local centres has been most successful in two ways—first, a member accused can ascertain the address of a solicitor who has knowledge of motor questions. I am not a practising barrister, but I understand that a good deal of effect is produced when a barrister knows the methods of the judges before whom he has to plead, and by the appointment of local solicitors the best way is provided for placing cases before the particular justices hearing the case. The touring department, in which an equal number of members of the Motor Union were elected to constitute the committee with the same number of the Automobile Club, has worked smoothly and well. To the commercial vehicles department the Union has given its cordial support. The Motor Van and Omnibus Users' Association has appointed a committee representative of the Royal Automobile Club and others, which is about to carry out a series of trials for commercial vehicles. These trials will be the logical successors of the commercial vehicle trials carried out by the Liverpool Automobile Club and Self-Propelled Traffic Association in 1902. I think we all recognise the value those trials had, in that they no doubt gave us a hold of the commercial side of the industry. I hope that the trials to be held this year will be even more successful. It is interesting in that connection to notice that the disagreements, lasting over some years, with the Motor Union have been successfully adjusted, and that the Liverpool Club has now come into line with all other clubs. We are able to report that the Motor Union and the Royal Automobile Club have each given £25 towards liquidating the debt of £75 remaining upon the Liverpool Club's commercial vehicle trials, the latter club raising the remaining balance. I feel perfectly certain that during this coming year the Motor Union will not only advance as it has done in the past, but that it will advance even more rapidly, and that you will support Mr. Rose in the same loyal and kind manner in which you have supported me throughout the past two years. The success belongs to the whole of the members of the Motor Union, with whom I have worked with a single object and aim,

and that is the advancement of the good cause of motoring in this country. I beg formally to move the adoption of the report.

Mr. M. J. Tuchmann seconded the motion, which was agreed to unanimously. Motor Union medals were presented, and a hearty vote of thanks to Mr. Rees Jeffreys and his staff concluded the proceedings.

WEST SURREY.

THE annual consumption trials of the West Surrey A.C. were held on Saturday, when members met at Hurtmore Holt, near Godalming, by invitation of Col. Fairtlough, chairman of the club. The course thence was through Milford to Haslemere and back, a distance of nineteen miles over a very hilly course. No account was taken of time except, that a maximum of an hour and three-quarters was not to be exceeded, stoppages being included. The results were adjudged on ratio of petrol consumed to total weight of car and passengers, and were as follows:—

Name.	Car.	Time.		Weight		Petrol	Per
		h. m.	lb.	lb.	oz.		
R. W. Buttemer	14-h.p. Renault	54	3,132	93	93	030	
A. C. Tessier	12-h.p. De Dion	59	2,583	102	102	040	
R. S. Robertson	6-h.p. Siddeley	1 20	1,793	77	77	043	
W. G. Crothers	9-h.p. Darracq	1 15	1,824	93	93	051	
Capt. Leng	10-h.p. De Dion	1 16	2,414	124	124	051	
Dr. Minchin	8-h.p. De Dion	1 28	1,946	114	114	059	
G. H. Gill	10-h.p. Victoria	1 14	1,925	119	119	062	
J. F. Kimber	6½-h.p. Quadrant	1 14	963	62	62	064	
Tricar							
Dr. Hall	9-h.p. Clement	1 29	2,235	147	147	066	
E. E. Pullman	15-h.p. Aries	1 15	3,296	224	224	068	
J. F. Conafor	8-h.p. Clement	1 11	1,951	143	143	074	
J. H. Knight	10-h.p. Gladiator	1 24	2,062	153	153	074	
Dr. Gabb	15-h.p. Darracq	1 11	2,700	309	309	114	

The members were afterwards entertained to tea by Col. and Mrs. Fairtlough, who subsequently presented the prizes. The thanks of the Club are particularly due to Mr. C. W. S. Crawley, who journeyed down in order to act as judge and control the measuring operations.

NOTTINGHAMSHIRE.

MR. ANTHONY G. NEW read a paper on the "The Tourist Trophy Principle" at a meeting held under the auspices of the Nottinghamshire Automobile Club at the club's headquarters, the Black Boy Hotel, Nottingham, last week. Amongst those present were Messrs. C. Hardy (president), Booth-Granger (secretary), C. Perry, R. A. Young, A. T. Cresswell, Dr. P. Tresidder, Dr. S. Tresidder, Dr. Grey, Messrs. S. Harvey, A. King, J. Truman, H. Rimington, M. Ross-Browne, and A. R. Atkey.

Mr. New said it seemed almost hopeless to devise any type of competitive event which would be thoroughly satisfactory as a means of placing a number of cars in their true order of merit. Cars to-day were merely speed machines for getting from place to place as quickly as possible, nor was reliability while on the road of greater importance than cost of upkeep; but even taking these three qualities alone—and obviously many others could be added—every motorist had his own idea as to their relative significance. No useful competition for touring cars need concern itself with other qualities than reliability, durability, and flexibility, with which were more or less directly involved economical running, low cost of upkeep, all-round efficiency, hill-climbing capabilities, and good powers of acceleration and deceleration. The Tourist Trophy principle did not favour any particular type of engine, nor was the Tourist Trophy race an event for merely encouraging economy of fuel.

The club will hold a carnival on the Trent Embankment on July 6th, and the race for the Wilson Challenge Cup will be held over the private drive at Clipstone on May 11th, by permission of the Duke of Portland.

SOUTHERN M.C.

A LANTERN SHOW and musical evening took place at the Club House on Thursday last week, when Mr. Hocart lectured on Egypt and the Nile. Slides were also shown by Mr. Pratt of competitors and incidents of the International Cycle Races held in France. Mr. Pattison had some interesting views of the Eliminating Race for the 1906 Gordon Bennett. The club sporting events were well illustrated by slides lent by Messrs. J. W. Cuffey, H. Billing and others.

The opening run of the season and Easter tour takes place to Brighton and the South Coast.

BROOKLANDS.

THE following dates have been definitely settled for holding race meetings on the motor racing track at Brooklands, Weybridge, during 1907:—July 6th and 20th, August 3rd, 5th, and 17th, September 14th and 21st, October 5th and 19th, and November 2nd.

WE have received from the Clement-Bayard Company, of Levallois Perret, Paris, a copy of the latest catalogue of Clement-Bayard cars. This gives full particulars of all the new models, together with some interesting details of the factory in which they are built.

MOTOR LUBRICATION.

(Concluded from page 74.)

CONTINUING my remarks on the above subject in the last issue, may I now explain, for the advantage of the ordinary reader, what is meant by "solid friction" and "liquid friction." Solid friction implies the coming into direct touch of each other of the rubbing surfaces without any film of oil to keep them from tearing each other. A few moments of solid friction would ruin a motor. Liquid friction merely indicates the retardation of motion due to the particles of the oil themselves, and a slight increase of this kind of friction, so far from being condemned, should be looked upon as a factor of safety in the oil, preventing the likelihood of damage to any part of the motor.

Even with the very best lubricants that can be produced, absolute liquid friction is not obtained; if it were, all wear of machinery would be entirely stopped. Though such perfection is beyond our reach, yet, by the use of a thoroughly good lubricant, we can approach very nearly to it.

I think that both motorists and motor engineers will readily call to mind certain makes of motor-cars that have a reputation for wearing out rapidly. These cars run well and are splendid hill-climbers, and, for these reasons and the lowness of first cost, sell in great numbers. Now, why do they wear out so quickly? You may say that they are not made of good materials, and the gears, &c., not hardened; but I think these arguments cannot apply to the cylinder and piston rings, &c., which are, of course, made of fine cast iron in the same way as other motors which have a very much better record for durability. I think I can state one good reason why they do not last

correct in his idea that the lubricant is always being displaced by fresh oil films, and it is Mr. Duckham who is "out of his reckoning" when he asks where the oil "runs to," in an attempt to be funny at Mr. Critchley's expense; but if he will examine the top of the piston and the top of the inside of the cylinder of any motor that has been in use some time, he will gain some of the information he apparently requires.

The true function of a lubricant is to lubricate, not to "fly off," which term would be all right if applied to petrol or paraffin or other substance that might be used to obtain power in a motor. All scientific men are agreed that that oil is the best lubricant which vaporises least and which has the greatest carrying capacity and endurance in relation to its viscosity, flash point, and specific gravity. As I explained at the beginning of this communication, that is the chief reason for compounding oils in the way that Mr. Veitch Wilson mentioned in his letter.

Certainly very large gas engines can be successfully lubricated with oils that are not heavy. My firm have done so for many years; not, however, with light mineral oils such as Mr. Duckham appears to favour; but we must bear in mind that a stationary engine works under very much more favourable conditions than obtain in a motor-car engine. When motors were first introduced, some makers and users got good results from gas engine oils, and still continue to use them. At that time the oiling fittings were, with few exceptions, not capable of dealing with heavier oils satisfactorily. Each year sees improvements, and when positive oiling apparatus and pipes of larger diameter become standard, in place of the unreliable happy-go-lucky oiling arrangements that are now gradually being discarded, we shall, I believe, find that lubrication will cease from troubling and the motor will be less at rest in the repair shop.

The Garage at Kennington of the General Motor Cab Company.

The buildings occupy two acres, and give accommodation for 960 motor-cabs. The petrol store will contain 3,200 gallons of petrol, and has a roof so constructed that on the outbreak of fire a layer of sand, weighing 62 tons, will descend to extinguish it.

better. Their makers fit them with oiling arrangements for the use of good thin lubricants which they recommend. Sometimes the users get good thin oils, but oftener they do not, with the result that the cars are soon in need of extensive repairs, for the reasons I have already stated. I have had some of these cars under my observation for two years. On my recommendation, good oils of a thicker kind have been used, and as a result these cars have not given trouble, are wearing very satisfactorily, and have not yet required repairs of any kind.

Mr. Duckham's remarks on Mr. Critchley's thin v. thick oil experiments reveal ideas so "unique" as to the function of a lubricant that it is necessary to say a few words to dispel his illusions; lest, if his statements be permitted to pass unchallenged, they may be accepted as scientific and lead others astray. He speaks of the oil on the walls of the cylinder "bolting off" at each explosion, and leaving "little or no residue." Now no lubricating oil worthy of the name will "bolt off." If it did, all the lubrication the walls of the cylinder, &c., would get would be the very small quantity of oil that the piston rings would bring up with them on the two next up-strokes. That certainly would help to solve the smoke problem; but it might also soon settle the life of the motor. What really happens when light oils are used is that some of the lower boiling fractions of the oil are vaporised, not distilled, and a heavier bodied lubricant is left on the cylinder walls, which combines with the oil brought up on the two following up-strokes. It is thus that a lubricant is produced in the motor from a good thin oil that may be capable of giving better lubrication than will a bad quality of thicker oil. Mr. Critchley is quite

I noticed a further letter recently from Mr. Duckham, which shows that he has seen some motors opened up, and discovered where part of the oil "falls to" that was mentioned in Mr. Critchley's letter. If Mr. Duckham had not so carefully stated that his letter was written some months ago (though not published till now), one might have concluded that he had made his discovery in the pages of a contemporary journal in which the matter was dealt with a week or two ago. The engine he refers to had evidently been fed on a mixture of bad oil and road dust. A fine gauze filter on air inlet would greatly remedy the dust entrance, and a better quality of oil would decrease the carbon deposit.

There is a good deal of sound common sense in the views expressed by Mr. Newton, which show that he has given some thought to his subject; and if he had not followed the pernicious example of some other equally unqualified writers of endeavouring to clench his arguments with scientific authority, he would have been entitled only to commendation. Even as it is, he deserves some thanks, for he gives far more practical information to the motorist and motor engineer than such letters as the last two I have reviewed. Where Mr. Newton gives himself away is when he attempts to classify the different kinds of friction, a subject he has yet to study further. Meantime, let me show where he is in error, as the information may be useful to others. He makes the common mistake of confusing rotary motion with rolling friction. Thus he arranges his groups of motion:—(a) cylinder walls, piston, and gudgeon pin; (b) crank shaft bearings, cam shaft, and big ends of connecting rod. In group (a), the friction is "sliding friction," as he states. In group (b) he says, the friction is "rolling friction"; and it is here he errs, for unless these motions are run

on balls or rollers (which is rare), they produce exactly the same kind of friction as does the group (a), viz., they "slide" or "glide" on each other and cause "sliding friction." In some engines the valve lifters have little rollers that rest on the cams, and the Lacoste form of "wipe" has a little roller that makes contact; both of these are examples of "rolling friction." The two-to-one gears and the whole of the other gears are by some individuals looked upon as instances of "rolling friction;" but even in these there is not true "rolling friction," as the teeth of the wheels to some extent slide on each other, which is shown by the form in which they wear. When the gear shafts, pinions, and differential are provided with ball bearings, when the road wheels are mounted on ball or roller bearings, and when the steering apparatus is mounted on balls, in each case there is "rolling friction." In my endeavour to clear up this matter I have gone over the principal moving parts of a car: all the other motions can be classified in the same way. These terms "sliding friction" and "rolling friction" only indicate the kind of motion of the frictional surfaces. The terms "liquid friction," "plastic friction," and "solid friction" relate to the conditions under which the motions take place, viz., "liquid friction" implies the load supported by a fluid lubricant and the only friction being that of a fluid; "plastic friction" has exactly the same meaning when applied to motions that are lubricated with a non-fluid lubricant, such as grease; and "solid friction" simply means that the rubbing surfaces are in direct touch without any kind of lubricant between.

In stating the foregoing facts regarding motor lubrication I have endeavoured as far as possible to avoid technical phrases and figures which only mystify non-technical readers. I hope I have made them sufficiently clear that "he who runs may read."

D. D. B.

The Flexibility Trial.—The Competing Cars at Boxhill.

ALLEGED "FRAUDULENT" MOTOR SCHOOL.

WM. ADDISON, 20, and Rupert Foulkes, 20, were charged at Brighton Borough Bench, on the 21st inst., with conspiring together on or about 29th October last to obtain by false pretences the sum of £2 in money and four postal orders for the payment of £1 2s. 6d., with intent to cheat and defraud Alfred Wm. Young, Wm. Hookway, Leopold Proctor, Herbert George Dunstan, and Ernest Waddington.

Earl Russell (instructed by Mr. C. Buckwell) appeared to prosecute on behalf of the Sussex County Automobile Club, and intimated that there were a number of cases against the prisoners, but that he only proposed to go into one of them that day, that of obtaining £2 from Alfred William Young, and then apply for a further remand. A. W. Young, W. T. Chessell, and other witnesses gave evidence, including Major Thomas Swaffer, who said his brother and he had owned a 15-h.p. Darracq motor-car, which was stored at the prisoners' garage about three weeks, until August 12th. Prisoners were not allowed to use it; but in consequence of suspicions and marks of usage found on the car it was taken away on August 12th. Earl Russell then applied for a remand, explaining that the witnesses in the other cases had to come from a distance. Prisoners were accordingly remanded until the 27th inst. Neither prisoner was able to offer bail. Addison was released on his own recognisances in the sum of £20, and Foulkes was offered bail on his own recognisances in the sum of £20 and two sureties of £10 each.

CASES UNDER THE MOTOR CAR ACT.

EXCEEDING THE LIMIT.

At Kingston, on the 21st inst., Thomas Joyce, chauffeur to Mr. Oscar Lewisohn, was summoned for driving a motor-car at a greater speed than twenty miles an hour at Kingston Vale, on February 26th, and he was also summoned for driving a motor-car without a licence. Police-constable W. Jones said he timed the car over a measured furlong, which it traversed in 15.2.5 sec., or at a speed equal to 28 miles 388 yards an hour. When asked to produce his licence the defendant said it was at home in his motor coat. P.S. Holly said the defendant came to Balham Police-station on February 27th, the day after he was stopped, and produced two licences, an old one, which had expired on January 14th, and a new one dated February 27th, the day he came. The Bench imposed a fine of £5, and 10s. costs, for exceeding the speed limit, and of £1, and 10s. 6d. costs, for having no licence.

DANGEROUS DRIVING.

At the Torquay Police Court, Henry Wheeler has been summoned for driving a motor-car in a manner dangerous to the public on March 9th. Leonard Pearce said on the day in question he was delivering milk from a four-wheel wagon in Barramore Road. At the bottom he saw the car driven by the defendant, who came around the corner at a very fast rate and without sounding his hooter. The car came around on its wrong side and dashed into witness's cart. Mr. Easterbrook said the defendant admitted that he was guilty of an error of judgment in taking the corner so closely. Defendant was fined £5 5s., inclusive.

Albert Kite, of 75, Ellis Street, Holloway Head, Birmingham, was summoned at the Acock's Green Police Court for driving a motor-car to the common danger. It was said that the car was being driven at the rate of nearly thirty miles an hour, and that Dr. Dickson, of Yardley, narrowly escaped being knocked down. Mr. T. F. Mason, for the defence, sought to show that no offence had been committed. There was no vehicular traffic on the road, he said, except a stationary tramcar. Kite's estimate of his pace was eight or ten miles an hour. A fine of £10 and costs was imposed.

ROAD REPORTS.

EAST SUSSEX.—The East Sussex County Council have decided to apply to the Local Government Board for a regulation to restrict to five miles an hour the speed of motor-cars on a length of road leading from the Lewes to Eastbourne main road at Berwick to Seaford, commencing from a point near Winton Farm and passing through the village of Alfriston, past Frog Fille and Tile Barn, to a point about 550 yards south of the latter place. The total length of the road proposed to be "restricted" is 3,350 yards, and the foundation of the Council's decision in the matter appears to be its tortuous nature and the steep gradients in its course. In two places the road winds almost at right angles, and is obviously dangerous for rapid traffic.

DOVER.—The only road in Dover which will be under repair during Easter is the Maison Dieu Road.

SOUTHAMPTON.—None of the principal roads in the borough will be blocked up during the holiday; in fact, special efforts will be made by Mr. J. A. Crowther, the Borough Engineer and Surveyor, to avoid this.

HOVE.—None of the main thoroughfares in this borough will be under repair during the Easter holidays.

BOURNEMOUTH.—We are assured by Mr. F. W. Lacey, M.I.C.E., Borough Engineer at Bournemouth, that no roads will be left at Easter time or at any other time unrolled or otherwise in such condition that cars cannot pass over them.

TORQUAY.—There are no roads under repair in this borough at the present time.

RAMSGATE.—The whole of the main roads of Ramsgate will be perfectly clear for Easter.

FOLKESTONE.—All the roads within the borough of Folkestone will be in good condition during the Easter holidays.

PUBLIC MOTOR SERVICES.

THE motor-car service between Hythe and Folkestone will be extended during the coming season.

REPLYING to a suggestion that he should make new rules with regard to motor-buses in London, Mr. Gladstone, Home Secretary, has said that "motor-omnibuses, like all other forms of motor vehicles, occasionally broke down, and no regulation could prevent them doing so."

MESSRS. BRADSHAW BROS., of Melbourne, are negotiating with the Colonial Government for the inauguration of a motor service to bring Port Darwin within six days of Adelaide. This is in compliance with a request from the members of the Northern Territory, who complain of the uncertainty that exists with regard to the construction of a railway between Oodnadatta and Pine Creek.

THE motor-bus service at Shanklin, Isle of Wight, was resumed on Wednesday.

MESSRS. J. KEELE AND COMPANY, of Brooke Street, W., have taken up an agency for the Belsize cars, and have now in stock for trial purposes one car of each model, including the 60-80-h.p. six-cylinder vehicle.

COMPANY NEWS.

MEETINGS.

DAIMLER MOTOR COMPANY (1904).—Mr. E. Manville presided over an extraordinary general meeting of the company held at Coventry on the 21st, to consider a scheme for unifying the existing two classes of shares, so as to enable the company to issue a new class of preference share to provide the necessary capital for development of the works. The chairman said the board, having considered various ways in which capital could be raised, came to the conclusion that the best method was to alter the articles of association so as to enable the present preference shares to rank as ordinary (existing shareholders receiving a bonus of 6 per cent.), and then create 300,000 preference shares, 100,000 of which would be issued at once. Mr. Wood (director) seconded, and after discussion the resolution to modify the articles of association to allow the rearrangement of capital to take place was declared carried. It will be necessary for separate meetings of both preference and ordinary shareholders to be held and pass the scheme.

DUNLOP TYRE COMPANY.—Mr. Harvey Du Cros presided at the annual meeting of the Dunlop Tyre Company, held in Dublin on the 21st inst., and in the course of his statement said that the motor trade was even more important than the cycle trade. The foreigners had the start of them both in motor-cars and motor tyres, but he was happy to say that the English manufacturer was following the lead of the cycle manufacturer and was holding his own in this country. The importation of foreign motor-cars was likely to be resisted successfully by the English maker, and the same was likely to occur in relation to the provision of the tyres which were such an important part of the trade, and he thought they would not be content to fit foreign tyres on an English or Irish car. Reviewing the present position of the company, the Chairman said that since the expiration of the patents it was to all intents and purposes a company trading under entirely new conditions. From their subsidiary companies they had brought to their balance-sheet in 1904 £80,518, in 1905 £127,731, and in 1906 £167,655. The profits of the company for 1905 were £129,497 and the second year £209,969. In 1905 they paid away out of profits £104,315 and in 1906 £138,295.

NEW COMPANIES REGISTERED.

BRITISH DE DIETRICH.—£100. Manufacturers and proprietors of, agents for, and dealers in motor-vehicles, &c. No initial public issue. Registered without articles.

EXPRESS MOTOR CAB COMPANY.—£40,500. Agreement with the Compagnie des Voitures Automobiles de Paris, 14, Devonshire Square, E.C.

TORQUAY ROAD CAR COMPANY.—To adopt an agreement between Sir Henry B. Robinson (for the Vale of Llangollen Engineering, 'Bus and Garage Company, Ltd.), of the one part and the promoters (the directors) of the other part, for the acquisition of three motors and spares for £1,500, and to take over the lease of a garage in Market Street, Torquay, lately occupied by the Torquay and District Motor Omnibus Company, Ltd. First directors: Messrs. W. W. Cox, E. Hutchings, A. Backhouse, L. Powell, J. S. Carter, and W. E. Thomas. 7, Tor Hill Road, Torquay.

FRINTON-ON-SEA MOTOR BOAT COMPANY.—£150. No initial public issue. Registered without articles.

THE GLASGOW AUTOMOBILE COMPANY.—Registered with a capital of £5,000 in £1 shares. No initial public issue.

CLAIMS AGAINST MOTORISTS.

AN accident at the top of Dale Hill, Sussex, in which a motor-car and a cab collided, formed the subject of a remitted action before his Honour Judge Scully, at a special sitting of the Brighton County Court on the 20th, when David Matthews, a cabdriver, 63, Franklin Road, Brighton, sued the Brighton and Sussex Motor and Carriage Works, Ltd., 13A, Cannon Place, for £64 10s., as damages for injury to the plaintiff and his cab by the alleged negligent driving of the defendants or their servants on December 1st last. In delivering judgment, his Honour said that even if he accepted the evidence that the horse did pull out just before the accident he was still of the opinion that there was sufficient evidence to hold that the accident was occasioned by want of due care, that was to say negligence, on the part of the driver of the motor-car. The driver of a motor-car ought not to run things too fine in passing a horsed vehicle. It was a dangerous proceeding, and if an accident happened from the horsed vehicle slightly altering its position the motor-car was not freed from responsibility. Judgment was entered in plaintiff's favour for £10 8s. with costs.

AT the Huddersfield County Court, before Judge Gent, Emma Taylor, weaver, of Armitage Bridge, has sued Charles Hirst Mitchell, motor-car engineer, of Chapel-street, Huddersfield, for £100 for personal injuries sustained by being knocked down by a motor-car owned and driven by defendant. Counsel for the plaintiff said that she had descended some steps leading into the Huddersfield and Honley road when returning from her work at Taylor Hill Mills. She looked to the right, the direction from which traffic might be expected, and was immediately knocked down by the defendant's car, which was being driven on the wrong side of the road. She was rendered unconscious, and was conveyed by the defendant in the car to the surgery of Dr. Edwards, at Huddersfield, a distance of two miles, was incapacitated from work for nine weeks, and now suffered in nerves as a result of the shock. The defence was that there was contributory negligence by the plaintiff. His Honour awarded the plaintiff £71 5s. damages.

ASSAULTING A MOTORIST.

AT Marlborough Street Police Court, before Mr. Denman, John Field has been summoned for an assault upon E. Schwartz, driver of a motor-car belonging to Mr. Max Pemberton. Mr. Moresby White, in appearing for the Motor Union, said they were taking up this case because assaults upon drivers of motor-cars were becoming so frequent that it was the duty of the Union to protect its members. The driver of Mr. Max Pemberton's car was proceeding up Rathbone Place when, passing a horse and cart in which were two men, the driver of the cart lashed out with his whip and struck the motor-car driver a severe blow on the face and neck. The motor-car driver immediately stopped his car and got down and ran after the horse vehicle, caught the horse's head, and stopped the cart. The driver again lashed out several times with his whip, hitting the motorist over the face. A crowd gathered, and the motorist letting go of the horse, the driver lashed the horse and galloped away. He was fortunately stopped by a policeman to whom someone had given the alarm. Mr. Denman fined the defendant 40s. and costs, or in default twenty-one days' imprisonment. Defendant was removed to the cells.

THE SCOTTISH RELIABILITY TRIALS.

THE rules of this trial have been issued to the manufacturers, and the following firms have made entries:—John A. Peacock

The above illustrations depict one of the eight-cylinder engines Messrs. Weigel Motors, Ltd., are building for the racers they have entered for the A.C.F. Grand Prix race. One view shows the base chamber open and the crankshaft being laid in its bed, and the other the cylinders in course of erection.

(Chenard and Walcker), Walter Gutmann (Chenard and Walcker), Reo Motors, Ltd. (Reo), Albion Motor Car Company, Ltd. (Albion), New Arrol-Johnston Car Company, Ltd. (New Arrol-Johnston), John S. Napier (New Arrol-Johnston), T. C. Pullinger (Beeston Humber), Rolls-Royce, Ltd. (Rolls-Royce), Rennie and Prosser, Ltd. (Rennie and Prosser Siddeley), W. Watson (Berliet), St. Vincent Motor and Cycle Company, Ltd. (St. Vincent), Frederic Eastmead (Sunbeam), Argyll Motors, Ltd. (Argyll), Capt. F. Vernon Wentworth (Daimler), Belsize Motors, Ltd. (Belsize), Mrs. Ed. A. Riley (Belsize).

POLICE TRAPS.

THE police are adopting their trapping tactics in Kingston Vale, and motorists passing that way during the holiday season should proceed warily.

IN the recent commercial vehicle run to Ripley, the Adams van arrived second, passing several others on the upgrade.

FOR the convenience of motorists in town during Easter Messrs. Friwell's premises in Albany Street, Regent's Park, N.W., will be open continuously throughout the holidays.

AN AUSTRALIAN RELIABILITY RUN.

[FROM OUR MELBOURNE CORRESPONDENT.]

THE possibility of a big Australian automobile reliability contest down the east coast of Australia is a prospect that has frequently been discussed by several keen and enthusiastic Victorian motorists. A motor contest from Brisbane to Adelaide would not only be possible, but would afford a test of the reliability of the automobile for Australian use that would attract considerable interest throughout Australasia. Whilst the route between Brisbane and Adelaide is not to be thought of from a point of racing speed, it is just the course to provide a severe test of the capabilities of both cars and drivers. As a sporting event it would provide an interesting trial that would attract a tremendous amount of attention throughout Australasia, and such a contest could easily be arranged if the respective automobile clubs of New South Wales, Victoria and South Australia and the automobile trade took the matter in hand. The route, which would be approximately about 1,850 miles long, would embrace some of the finest roads in Australia, and probably some of the worst, but the only real difficulty to be surmounted would be the Coorong, a seventy miles' patch of sandy and tussocky country to be crossed between Kingston and Meningie, on the South Australian side, but as this stretch has already been crossed by several cars, and once by Mrs. Thompson, a well-known Adelaide motorist, the troubles in this direction would not be insurmountable, and would only lend additional interest to the test. The route from Brisbane to Sydney would embrace some particularly fine scenery and plenty of mountain climbing, especially if the railroad route were followed up through Tenterfield and Warwick, but an alternative course would be available up the coast route, the only drawback being the number of rivers to be crossed by means of punts. In point of distance there is only about twenty miles' difference, the coast route being the longer. The three clubs mentioned, if generously assisted by subsidies from the motor houses, tyre firms, and oil companies, should have little difficulty in arranging such a contest for big cash prizes, say £250 first, and £100 divided up into place prizes. The conditions of such a test would have to be on more open lines than the recent big Dunlop 1,000 miles contest, for in a run of the kind suggested the class of roads and difficulties to be overcome along the route would effectually spread the competitors. Probably the best lines on which to organise such a race would be to give a handicap of so many hours or days' start to cars in different classes, and the first motorist to reach Adelaide to be the winner. To prevent competitors attempting night driving, which would be distinctly dangerous over the routes suggested, a driving allowance of say twelve hours a day could be arranged, contestants being required to "sign on" at different towns and villages en route; repairs and adjustments to be allowed, but no substitution of such parts as axles, wheels or frames being permitted, and the same car to be used throughout the long drive. Provision would also have to be made to prevent driving on Sundays, for the route would probably take the winner the best part of a fortnight to negotiate. Such a contest as that roughly outlined would outrival any sporting event, except the Melbourne Cup, held in this part of the world, and would focus so much attention on the automobile and its possibilities on our roads that motor racing generally in the Commonwealth would be the gainer. The suggested run is one worth the attention of the automobile clubs of New South Wales, Victoria and Adelaide.

MOTOR-CAR ACCIDENTS.

At Redhill a little girl was knocked down on Sunday by a motor-car, and received injuries to the head.

At Coulsdon a cyclist was knocked off his machine by a passing motor-car, and had his collar-bone broken, while one of the occupants of the car was thrown out.

A BOY named Robert Crampton was knocked down in the Broadway, Stratford, by a motor-car belonging to Mr. T. H. Mann, of Sawbridgeworth, on Saturday night, and was taken to the West Ham Hospital with a broken leg.

MESSRS. S. F. EDGE, LTD., have sent us a photograph of a 40-h.p. six-cylinder Napier car with landaulet body and front extension they have recently supplied to the Right Hon. Sir John Gorell Barnes, P.C., President of the Probate, Divorce and Admiralty Divisions. The carriage was built under the special supervision of Sir John himself and comprises several innovations suggested by him. The whole of the top portion can be folded entirely out of sight leaving the back quite open, so that when the wind screen is raised there is nothing but the four metal rods supporting the front canopy extension to interfere with the view or free passage of air. Then, if desired, by the slackening of four bolts the whole of this front canopy can be removed, so making the vehicle into an entirely open one. Another point that Sir J. Gorell Barnes insisted on was a petrol consumption test, which was conducted under his driver's supervision from Kensington Park Gardens on the North Road to Hatfield, and the consumption—even with this large body fitted—worked out at the excellent distance of sixteen miles to the gallon, including, of course, all the town work through Westbourne Grove, Finchley Road, Barnet, &c.

BUSINESS NEWS.

MESSRS. WALKER BROS. (WIGAN), LTD., a well-known firm of engineers, have taken up the construction of motor-vans, lorries, and all classes of industrial vehicles, at their works at Wigan.

BEFORE sending out their motor "Chemico" carbides, the County Chemical Company, Ltd., of the Excelsior Works, Birmingham, subject the carbide to a cleansing and preserving process which ensures the utility of their product. This preserving process was invented by the company seven years ago, and consists of coating the carbide with a preparation which preserves carbide from atmospheric action, and at the same time retards and regulates the decomposition when brought into contact with water.

AN interesting statement concerning the economy of motor vehicles for commercial use was recently made at a public meeting by one of the directors of the well-known match firm of Bryant and May. This concern has adopted motor-vans in place of horsed vehicles for delivery of its goods within a twenty mile radius of the factory, a change which effects a considerable saving in cost. With horse vans the average cost for the delivery of matches was 1.17d. per gross, but as soon as the motor-vans got to work the cost was brought down to .44d. A 30 cwt. delivery van—a repeat order—for Messrs. Bryant and May was shown on the Argyle stand at Olympia.

THE rebuilding of the factory of Messrs. W. and F. Thorn, in Little Portland Street, London, W., is now completed, and the firm are able to execute orders for motor bodies without delay.

THE Electric Ignition Company, Ltd., have issued a circular of twelve quarto pages giving numerous testimonials by leading motorists as to the efficiency of their electrical appliances.

MR. WILFRED R. WILLS has written to Messrs. Weigel Motors, Ltd., to the effect that, recorded by an O. S. speedometer, he has succeeded in reaching a speed of over seventy miles per hour upon his 40-h.p. Weigel chassis. This, taken in conjunction with another letter received the same day from Mr. Brossard de Marsillac, stating that he has succeeded, with six people on board, in climbing Turner's Hill, Sheffield, which has a gradient of 1 in 38, and which apparently is considered in Sheffield as practically unclimbable, tends to show the power and flexibility of the Weigel chassis.

THE Valor Company, Ltd., write:—"We have read a notice in the last issue of the *M.C.J.* under the heading "Some Useful Notes," recommending sand to be used in extinguishing petrol flames. From our experience as fire engineers, and especially in dealing with flaming petrol, we consider there is nothing more effective on the market than our New Era Petrol Fire Extinguishers for this purpose. There are several disadvantages in connection with sand, the principal being that sand thrown on a car, boat, or, in fact, any motor vehicles, does as much damage if not more than the actual fire, as the particles of sand, being so very fine, enter into the machinery and cause great damage. Another great disadvantage is the fact that sand cannot be thrown any distance to speak of, and it would necessitate a man standing very close to the fire with a bucket of sand so as to be able to throw the sand right on to the flames, the consequence being that he would become very badly scorched and burnt. As regards motor-omnibuses, vans, lorries, cars, &c., we make types suitable for these purposes, and can refer you to all the leading motor-omnibus companies in London, the police regulation being that an effective and handy fire extinguisher must be carried, and not sand in any way at all."

IN the Australian Reliability Trial of 223 miles over the Parramatta-Bathurst route, on January 25th and 26th, Dunlop tyres enabled several "full points" performances to be completed.

A 16-h.p. Reo car was recently driven from London to Brighton and back, carrying its full load of four passengers, on top gear, by Mr. F. Graham Sharp. In order that there should be no possible doubt as to its being a top gear run, the low gear had been disconnected altogether. Starting from the Automobile Club in Piccadilly, a dense fog prevailed until Streatham Hill was reached, a non-stop run made to Brighton at an average of twenty miles an hour being, however, made. On the return journey Handcross Hill was tackled. Within 200 yards of the summit the engine stopped, owing to the spark being too far advanced. In spite of having only the top speed connected up, however, the car got away again on the steepest part of the hill from a standing start, still carrying its four passengers. On reaching the summit a return was made, and the hill again tackled, this time with the utmost success, without once slipping the clutch. Wimbledon Hill, in spite of heavy traffic and roads, was climbed with ease, and the journey completed in good time.

ON the invitation of Mr. John S. Napier, managing director, Mr. Walter S. Ed. Macharg, secretary, and Mr. Ernest A. Rosenheim, sales manager, a large number of ladies and gentlemen were entertained to dinner in the evening of Friday last week in the Globe Hotel, prior to repairing to the George A. Clark Town Hall, in which was held the second annual dance of the company.

A CONTEMPORARY representing the interests of the meat trade has opened its columns to a discussion on the need for "closed-in" shops in country districts where automobiles raise the dust on the high road, to the disadvantage of the appearance of meat hung in open windows.

THE Motor-Car Journal.

VOL. IX.]

LONDON, SATURDAY, APRIL 6, 1907.

[No. 422.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

Cordingley's 12th Motor Show.

It is scarcely necessary to remind readers that Cordingley's Twelfth International Motor Show at the Royal Agricultural Hall, London, opens to-day (Saturday, the 6th inst.). This event is recognised as the inauguration of the selling season of the automobile year, and firms ready to deliver will assuredly reap a full reward of their patronage of an institution which has been the pioneer of this means of public education in automobile matters. This is the twelfth motor exhibition which Messrs. Cordingley and Co. have organised at the popular venue in North London, and, like each preceding display, will have its distinctive feature of popular recognition. At the first of the shows an artificial lake in the Gallery enabled a display of the promise of the motor-boat; this year in the Berner's Hall and adjacent gallery is an exhibition that demonstrates the possibility of the aeroplane and the flying machine in the future. On the ground floor is the representative collection of cars and pleasure vehicles, while the Minor Hall and the Gallery have their usual collections of heavy vehicles and accessories respectively. The present display will remain open throughout next week, and the railway companies, recognising the importance of the event, are running excursion trains on several days, which will enable provincial visitors to see the Show.

Official Visits.

SEVERAL organisations and many of the learned and scientific societies are making special visits to the Exhibition, and their inspection of the stands will be greatly appreciated by the exhibitors, for not only are they prospective motorists, but their influence will secure an important personal recommendation for any cars they favour. In this respect Wednesday next, April 10th, will be an important day at the Show, that being the occasion of the visit of the Ladies' Automobile Club, when a reunion in the afternoon, followed by a visitation of the stands, will enable exhibiting firms to bring their specialities to the notice of fair and influential motorists.

Railway Rates on Motor Bodies.

DURING the last few days some important proposals have been presented by a combined deputation of the Institute of British Carriage Manufacturers, the Society of Motor Manufacturers and Traders, and the Manufacturers' Section of the London Chamber of Commerce, to the Railway Companies' Goods Managers, at the Railway Clearing House. They suggested that carriage bodies in their raw and unfinished state should be classed under Class 2, as are "furniture van bodies empties" and when consigned as between trader and trader, and that such bodies when conveyed from one town to another town—being from one branch to another branch of the same firm, should receive in addition the preferential advantage of the "shop to shop rate" rebate rate of 25 per cent. With regard to motor underframes, or chassis, with wheels on, it was proposed that they should receive preferential treatment when con-

signed from one trader to another trader for the purpose of the mounting of the carriage body and completion, and on its return should be conveyed at the reduced rate of half rate back (this is as granted on the conveyance of carriages per passenger freight). Further, that motor carriages, if sent to a trader for repair or renovation, should on their return be conveyed at the reduced rate of half rate back, if returned within three months—this is as granted on the conveyance of carriages per passenger freight. It is to be hoped that these reasonable proposals will appeal to the authorities concerned, and thus effect a reform of real importance to the British motor industry.

1,000 Motor-Buses.

THE fact that there are close upon a thousand motor-buses in public service in and about the Metropolis serves to indicate the progress that has been made since last Easter, when the great unwieldy vehicle *en panne* in a leading thoroughfare of the City was one of the joys of the holiday crowd. To-day they are recognised as a silently growing force—the word silently being used advisedly in view of the improvement in the reduction of noise that has followed the stringent action of the police authorities. Of those in service about one-fourth are owned by the London Motor Omnibus Company, Ltd., the London General Omnibus Company and the London Road Car Company, Ltd., following next in order with just under 200 to the credit of each. Of the remaining 400 to 500 motor-buses, the ownership may be divided among twenty-four companies and private firms. There are no fewer than a score of different types of buses in public service in London, so that splendid opportunity for comparison is offered the proprietors.

Considerate Motorists.

THE General Committee of the Scottish A.C. have recently had under their consideration various cases of reckless or inconsiderate driving, and have resolved to make a general appeal to the whole membership of the Club on the subject. At the annual meeting of the Kent A.C. Sir David Salomons has made an earnest appeal to the same end. The fact that at an early date legislation relative to the use of motor vehicles on the public highways will be under the consideration of Parliament makes it imperative that the conduct of all automobilists should be such as will not only prevent antagonism and prejudice, but will gain appreciation and support on the part of the public. The Scottish Club urges the utmost attention to the courtesies of the road. In passing or meeting cyclists or horse-drawn vehicles the maximum space should be afforded them, and on narrow parts of roads, turns, or bridges they suggest that it would more generally be advantageous to refrain from passing till a suitable part of the road is reached. The utmost consideration should be shown to restive horses, and in such cases the car, and if necessary the engine, should be stopped, irrespective of whether the party in charge puts up his hand or not. Motor-cars travelling in the same direction should not be passed going downhill, at corners, or in traffic. Cars should be driven round corners and at cross-roads with great caution. In towns and villages the cautious and considerate driving of cars will exert a

powerful educative influence on the public mind with respect to the control and to the adaptability to the necessities of traffic of motor vehicles. Under the majority of the existing methods of road construction and maintenance the dust nuisance will continue to form a strong objection on the part of many to motor-cars, and we would urge the desirability of minimising the raising of dust and the special and urgent duty when passing vehicles, pedestrians, or roadside residences, of taking every means to do so. And by way of practical counsel the committee of the Club have prepared a card on the "Courtesies of the Road" (reproduced on another page) for display in motor houses.

Fraudulent Motor Agencies.

ON December 8th of last year we published a warning to drivers and others looking for situations not to send money to a firm that promised great things for small remittances. Invitation was also extended to our advertisers who received circulars from such an agency to forward them to our office. In response several were sent, upon which we took action with important results, as detailed in the police court at Brighton last week. On December 16th—a week after the publication of our notice—the police visited the address of "Foulkes, Addison and Co.," at Brighton, and told the two persons running the business that complaints had been received. There the matter remained

A Group of Rover Cars outside the Old Ship, Brighton.

awhile until the prosecution mentioned in last week's *M.C.J.*, undertaken by the Sussex County Automobile Club, and which has resulted in the conviction of one of the defendants and the binding over of the other to come up for judgment if called upon. The business is a miserable affair, and we only call attention to it in these columns with the object of warning young men to beware of parting with their money to strangers on mere promises. Owners of cars wanting drivers are in the habit of consulting our columns and writing to men who advertise that they want situations; this obviating the need for spending money with agencies, unless, of course, employment is actually found.

Motor Ambulance Work.

DURING the last few days fifty-two posts have been erected in various parts of the City of London, which have excited the usual speculation as to "nine days' wonders" in the Metropolis. These are in connection with the new motor ambulance service which is to be established, and of which a beginning has already been made by placing an electrical motor ambulance at St. Bartholomew's Hospital. A second machine is to be stationed in Rose Alley, near the Bishopsgate Police station, and two others are to be installed at other points when further experience as to their utility has been gained. The call

posts are fitted with locks, keys to which have been supplied to members of the City police force, who will, on occasions of necessity, unlock the post and pull a lever, which will register the call on a switchboard at the headquarters in Old Jewry. From thence the call will be re-transmitted to the ambulance station, those in charge of which will be acquainted with the position of the call post, to which the motor ambulance will be duly despatched.

Motor Ambulance for Surrey.

LONDON is not the only place likely to be served with a motor ambulance, the subject of the provision of such a modern method of helping to relieve suffering being under the consideration of the Guildford, Godalming, and Woking Joint Hospital Board. In fact, the General Purposes and Finance Committee have gone thoroughly into the matter, and submitted estimates to the Board showing that a 20-h.p. four-cylinder motor-ambulance could be provided for £650, this sum to include an extra compartment for bedding, while arrangements could be made for the provision of a competent driver at a remuneration of half a crown per hour. When, however, the subject was broached at a meeting of the full Board, it was mentioned that only a few members were present at the meeting when the subject was discussed, and the proposal has been remitted back for further consideration.

A Seaside Story.

MR. W. T. LORD, of Argylls London, Ltd., may be regarded as a motorist in search of adventure; whether he really looks for it is a matter about which we have not inquired, but certain it is that the unexpected has happened in his case, or rather, his car, within recent months. Last Christmas his 16-20-h.p. Argyll had an adventure in a snowdrift, and this Eastertide Mr. Lord's spin along the sands of Filey has given him newspaper distinction throughout the land. After enjoying the exhilaration of his seaside trip, the motorist and his companion left the car for the purpose of taking some photographs at the water's edge. On their return to the vehicle they found it had sunk axle-deep, and was still burrowing in the sand. Manumotive force being unavailing, appeals were made to the fishermen unloading the catches of fish from the boats for the aid of their horses. The fisherfolk were willing to lend the animals if the motorists bought the fish, and the problem thus presented was the enforced ownership of more fish than they wanted, or the loss of the car that they wished to retain. Eight minutes remained ere the tide would begin to flow, and so Mr. Lord bought the fish. With the assistance of the horses and carts, two motor-cars and a crowd of helpers the car was finally hauled out of its bed. Mr. Lord was able to drive the car to the hotel after giving it a preliminary wash. The fish were subsequently resold by auction, and the Argyll went on its way, the owner rejoicing at its recovery, though probably dubious as to the profits of the fish vendor.

Holiday Helps.

EVERY recurring holiday season brings the motorist into greater consciousness. He has become a person of high regard on the part of all who will do him homage in the way of trade, and who now keep their premises open by night as well as by day, so that he may go on his way with assurance. During the Easter from which we have just emerged, this fact was forcibly established during a long run through half a dozen counties, and on roads not always those designated the main highways. For the holidaying motorist the tyre depot has been kept open; the inspection pit has been uncovered; the garage doors flung wide apart; and stocks of spares, petrol and oil were previously replenished. This is a recognition of the fact that the car is no longer the monopoly of the monied classes, but has become the hobby of the professional man and the carriage of the man whose opportunities for travel are limited to week-ends and the festive days of St. Lubbock and others of older origin.

This provision for motorists has been almost universal and generally remunerative.

Hotels and Motor-Cars.

IN this connection mention may also be made of the growing recognition of the motorist by "mine host of ye inne." As yet we have not been able to surpass the French hotel-keeper in the rapidity with which appetising meals can be procured without notice in remote places, but ampler provision is now being provided for man and car than was the case only a short while since. Throughout the country a garage is now regarded as an essential equipment of a well-organised hotel, and where repair works can be added the favour of the motorist can be permanently secured. Every day brings evidence of the solicitude of the hotel proprietor with regard to the comfort of the motorist, and the illustrated guides they are issuing testify

mammal as was generally imagined. The weights of the heaviest flying birds, the great bustard and the trumpeter swan, did not often exceed about 30 lbs. The fact that a man was about four times the weight of the bustard put him at a great disadvantage in his efforts to fly. The great advantage possessed by the bird lay in its ability to develop proportionately about three times as much energy as a man could put forth working at his best, combined with the possession of very powerful arm and shoulder muscles. Those flying birds which possessed the smallest wings were found to have wings in the proportion of half a square foot to every pound of weight. In many birds the proportion was one square foot to the pound. A man weighing 12st. would therefore require two wings each measuring 14 ft. by 3 ft. To work such wings man's arm and shoulder muscles would be quite incompetent. If men, therefore, were ever to fly with wings they must rely on some extraneous source of energy.

Motoring in Canada.—A Summer Scene near Montreal.

to the new spirit of enterprise that is coming over the hotel world. A specific instance to hand is that of the Brine Baths Hotel at Droitwich, where the manager has just completed a large inspection pit in the hotel garage, and obtained the necessary licence to store petrol—an example that will be widely followed by up-to-date establishments.

Flying Animals.

DR. HOYLE, in a lecture on Monday afternoon at the Manchester Museum on "Flying Animals," had something to say about the ambition of man to raise himself in the air and about the light thrown upon the problem by a study of the structure of birds. He did not, of course, tell us how to fly, nor did he attempt to do much more than point out why a bird can fly and why a man cannot. In the matter of specific gravity, he said, the bird had not so much advantage over the

Easter Accidents.

UNFORTUNATELY the holidays have not passed without a crop of accidents—more numerous than we have previously noticed. Near Birmingham Mr. L. N. Rothschild had a mishap, which was made worse by the superficial wounds caused by the goggles he was wearing being broken. In several other places mishaps have occurred in consequence of the alleged neglect of the local authorities to see that owners of land have rounded the sharp corners of their property abutting on main roads. It is regrettable that it has been left to coroners' juries to call the attention of some of the County Councils to their duties in this respect. The other day a motorist was proceeding to Blackpool from Middleton. After passing through Kirkham he had to turn a sharp corner down an incline into the Blackpool road, where there was another corner almost immediately that had to be negotiated. In doing this a fatal accident happened, and at the inquest, just held, it was stated that four

accidents had occurred at the same corner during the last twelve months. No wonder that the jury recommended that danger signals should be placed on either side of the turn, and that the County Council be asked to widen the road. Surely the authorities will not need a second recommendation of that kind.

An Unfortunate Feud.

It seems a pity that the hatchet between the Automobile Club in Piccadilly and the Argyll Company, of Alexandria, N.B., could not have been buried, and that the Royal institution has not seen its way to let "by-gones be by-gones." The incident in last year's Tourist Trophy race was unfortunate not only in itself, but in the train of blunders that followed. Therein it was made manifest that the rules of the competition had scarcely been studied by the officials, and that a series of minor misadventures culminated in a disqualification that was not really a disqualification at all. Then there were calls for apologies and due humility, which produced little result but newspaper correspondence. Now, however, we are to be debarred the pleasure of seeing this car from the north of Britain in the race; but the Argyll Company, not to be outdone, invite all who wish to test their vehicles to journey to Glasgow, where a car will be in readiness to convey them to Alexandria, and after an inspection of the works the visitors will be given the delight of a ride by Loch Lomond side, a sail on the beautiful loch and a drive back to less lovely Glasgow for the evening train south. And thus Scotland will avenge itself on the little Manx island.

Technical Instruction.

In no part of the United Kingdom has automobile instruction been so carefully provided and planned as in Ireland, where the Technical Instruction Committee of the Urban District Council of Pembroke, near Dublin, has carried out a thorough system of work. Mr. E. M. Le Fluffy has been responsible for the instruction in the constructional details of motor-cars, with Mr. J. R. Evans as driving instructor. The class meetings are about to close, but we may say that the syllabus of work done is of an excellent character and might be copied with advantage by similar institutions elsewhere. Special day instruction in driving is only given to students who are able to pass a satisfactory test as to the knowledge they possess of the mechanism of cars and engines, so that the idea has been to combine practicability and utility, not regarding the matter as a pastime for amateurs, but a serious business for those to whom such instruction is likely to be useful.

A Burner for Crude Oil.

The evidence given by Mr. F. S. Stackard, of the firm of J. A. Curle, Ltd., before the Fuels Committee of the Motor Union prior to its adjournment for Easter, deserves more than mere mention. For he has found a liquid fuel burner that he believes deals with heavy fuel in such a way that would enable it to be serviceable in motor-car work. It is true that Mr. Stackard was unable to speak from experience of the internal combustion engine, but he believes, from the behaviour of his burner in other directions, that its adaptation to the automobile may be successfully undertaken. We hope the Committee will see the importance of putting the burner to a practical test, for there is a large available supply of crude fuel oil which, if utilised, would have a valuable bearing on the price of fuel for modern steam cars.

The Police as Motorists.

REALLY the police must stop their trapping or they will endanger members of the force. For the limbs of the law are becoming enthusiastic motorists. As is well known, many have qualified for the R.A.C. certificates, and the King has shown favour to his ex-policeman chauffeur. Now we learn that on Easter Monday there was to be seen outside the police-station

in Kennington Road a smart little motor-car, built like a covered van, which is one of a number to displace the horsed dogcarts which have for so long a time been driven by a constable in uniform, with messages from Scotland Yard to the various police-stations. The new motor-vehicle is painted chocolate, picked out with red, and the drivers, who are policemen, wear a dress of blue serge. The cars have the Royal monogram painted on both sides.

Schools and Cars.

WITH a pertinacity worthy of the cause the Petworth Rural District Council has been maintaining a strong campaign in favour of securing the provision of "motor signs at the approach to all schools on main or district roads in their district." A resolution to that effect was adopted at the last meeting, and the clerk was also instructed to request the West Sussex County Council to notify that all motorists should sound their horns when near schools. The Council is also being invited to pass bye-laws, if necessary, to secure such regulations being carried out. Even at the risk of our roadways becoming as badge-bespattered as some motor-cars, we would support the Petworth people in their proposals with regard to indicating to motorists the presence of schools near the road; but the idea of sounding the horns when nearing village seminaries seems to require a time limit—or the teacher might have an awakening at inconvenient times.

Motor-Boats at Brighton.

ON the occasion of the speed trials at Brighton it was generally conceded that the tedium of some of the later stages of the event might have been assuaged had motor-boat contests enlivened the proceedings. We remember with what relief the crowd looked out to sea when a Napier boat went careering lustily along, a memory of which is recalled by the energetic efforts now being made to strengthen the Brighton Motor Boat Club and make it an important organisation for all interested in motor boating, motoring, and seaside sports. Admiral the Hon. T. S. Brand, R.N., has consented to be the first Commodore, and Sir Theodore Angier, R.N.V.R., the first Vice-Commodore, and several well-known gentlemen have promised to fill the other necessary offices. It has been decided to hold an annual regatta, and it is hoped to organise a meeting lasting about a week, during the summer, in which the owners of the largest and most celebrated motor-boats in the United Kingdom will compete. It is proposed to conclude the regatta with a carnival.

At the last meeting of the Motor House Committee of the Royal A.C. a letter was received from the Club Engineer in which he reported that the 14-h.p. Star car had been in continuous use for driving lessons and general instruction for over thirteen months. The car had run over 10,000 miles, and the repairs and replacements to the mechanical portion of the car had been nil.

O'GORMAN'S Motor Pocket Book has a handy compartment for the reception of the driver's licence and over 700 pages of information, chiefly of a technical character. The inclusion of definitions of such words as "fatigue" and "lend" may occasion some surprise, although the advice under the latter heading is useful, viz., "Don't lend your car. If you do you will learn why such high prices are charged for hiring out petrol cars." In addition to instructions as to how to avoid trouble, or, when in difficulties, getting out of the same, Mr. Mervyn O'Gorman has a characteristic chapter on the legal position of the motorist, and much information with regard to mechanical matters. But it is impossible to review such a work in the orthodox manner, for the author confesses to "chaffing his readers about 'broken bones' and 'drinks' and 'recalcitrant aunts,'" and apologises for such breaches of dull solemnity. He may, however, be commended for the trustworthy character of his Pocket Book, which is published by Messrs. A. Constable and Co., Ltd.

MOTORING IN ALGERIA.

ALGERIA, at the threshold of the African Continent, offers great opportunities for the rapid development of automobilism. In the first place, there is the attraction of touring in a country, so near Europe, which possesses exceedingly picturesque scenery and a native population which has retained its ancient customs to the present day—a country which, by its historical associations and its excellent climate, excites the curiosity of the traveller. Along the coast and in the large cities European customs prevail, but on penetrating into the interior of the country one soon enters an agricultural district, where the French colonist intermingles with the native, a country of cereals, wines and stock raising. Motoring has developed in Algeria coincident with the economical advance of the colony. European modes of life have brought with them their need of activity and have superseded the lazy indolence of the natives, to whom time does not count, and who never hurry in anything. The large towns are at considerable distances from each other, and railways have not yet penetrated everywhere. It thus became necessary to make use of the motor-car for commercial purposes and for pleasure trips, to supplement the other means of communication.

It may be readily understood that a country extending 1,200 kilometres east and west, from Morocco to Tunis, and 800 kilometres north and south, from the Mediterranean to the Desert, cannot well have an uniform climate. Near the coast the winter is charming, the weather being mostly sunshiny and the average temperature somewhat higher than at Nice, and at the famous Cote d'Azur. The variations in the daily temperature are also smaller. In November nature awakens from its slumber of the hot season; the gardens are flowering, the fields become green and the orange trees bear fruit. In the highlands the winter is more rigorous, however, the peaks are snow-clad, and in certain parts of the country about the same low temperature prevails as in central France. In the southern part of Algeria there are very great variations in temperature between noon and night, and it is not at all rare for the mercury to drop in twenty-four hours from 77 deg. Fahr. to freezing point. During the winter there are frequent rains, but never of long duration. From the month of April onwards the rains become rarer, and the dry period sometimes extends to the month of October. It is marked by very intense heat in July, August, and September, reaching frequently 140 deg. in the shade in the lowlands, which high temperature is due to the sirocco, a southern wind heated in its passage through the vast sandy desert. Tourists prefer driving in Algeria during the wintry months. Nevertheless, the summer season has its charms, particularly in the southern region, where the local colouring then attains its maximum interest. Up to recently motor-cars were only used privately. A short time ago, however, a public service was established for carrying passengers between Affreville and Teniet el Haad, a distance of thirty-six miles, and various lines are now under consideration for connecting the railway with centres of population of sufficient importance.

It would seem that the motor-car was destined to fill a real need in the economical system of Algeria. This might seem strange at first, if it is remembered that the country produces a great number of fine horses which sell at low prices, and the maintenance of which is quite inexpensive. The automobile, however, offers advantages from the standpoint of increased speed, endurance and relative cost in many instances, and for omnibus service over distances of thirty to sixty miles, for regular lines in suburban districts, and for the transportation of merchandise, motor vehicles will no doubt find advantageous use.

The number of vehicles which have so far been registered in the Department of Algiers is 445, in the Department of Constantine 117, and in the Department of Oran 65, making a total of 627 cars. The price of vehicles is the same as in France if the vehicles are taken possession of at the factory; otherwise it is increased by the cost of transportation, which amounts to from £6 to £8 per vehicle from Paris to Algiers. Petrol is kept for sale at all the garages, and at nearly every locality connected by

a road suitable for motoring. The garages in the larger towns are equipped for making all necessary repairs. It will thus be seen that although Algeria is a country of relatively recent development, it offers the same facilities in the way of supplies and repairs as most of the provincial districts of France. Chauffeurs are trained locally; they are quite numerous, and the wages range from £5 to £9 per month. For touring the country it is possible to hire vehicles at prices varying from £3 5s. to £5 per day, according to the mileage. Touring maps are available which show all the principal roads and the steepness of the hills. As to the former, they elicit the admiration of all tourists. The national and departmental roads are generally 36 ft. wide. The manufacture and use of automobiles in Algeria are regulated by the decree of May 28th, 1902, which provides measures generally similar to those in force in France. As regards the motor traffic regulations in Algeria it is provided, however, that vehicles of foreign origin, before being placed in service, must be submitted to the Department of Mines to determine whether they conform in every respect to the legal requirements; if the car is found to be of the proper construction, the manufacturer or owner is furnished a certificate. For placing a car in use an application must be made to the prefect of the department;

Touring in Sicily.—An Ancient Grecian Theatre near Messina.

declarations made in France are, however, honored in Algeria. Although the regulations provide that the speed must not exceed 30 kilometres per hour in the country and 20 kilometres in towns and villages, they are by no means rigidly insisted upon.

To explain the electrical ignition necessary in connection with petrol motors is the purpose of a new book recently published by Messrs. Whittaker and Company. This is by Mr. W. Hibbert, whose lecture at the Royal Automobile Club recently occasioned much discussion. The author's experience in connection with the Electrical Engineering Department of the Regent Street (London), Polytechnic has enabled him to explain "electric ignition for motor vehicles" in a simple way for the benefit of novices. We have the meaning of timing explained, and explanations of primary and secondary batteries, contact makers and coils, much attention being given to the action of the latter. Instructions for the wiring connections of multi-cylinder motors are given, free use being made of elucidatory diagrams. Recognising the popularity of the magneto, Mr. Hibbert goes fully into that branch of the subject, and his chapter on "Faults" will assist his readers to avoid them.

CONTINENTAL NOTES.

Touring Trials in the Touraine District.

The Automobile Club de Touraine is organising two competitions for touring cars, to be held from June 19th to 22nd next. The first, which is known as the Coupe de Touraine, is for teams of three cars, whose endurance and regularity of running will be tested by five runs of 200 kilometres, the prize being awarded to the team which, collectively, gains the highest number of marks. The second event is known as the Grand Prix de l'Automobile Club de Touraine, and is open (1) for cars of a minimum weight of 941 kilogs., and engines of a maximum of 127 sq. centimetres piston area; and (2) vehicles maximum weight 1,503 kilogs., and maximum piston area 226 sq. centimetres. The programme for this trial consists of three daily runs each of 200 kilometres. Full particulars of both competitions can be obtained of M. Barat, 27, Rue Victor Hugo, Tours.

Pekin to Paris by Motor Car.

Much interest is being taken in the projected automobile run from Pekin to Paris which is being organised by "Le Matin," of

The Kaiser's Prize Race.

The Kaiser has notified the German Imperial Club of his intention to offer four additional prizes in connection with the race for the Kaiser's Prize, which is to be held on the Taunus course on June 14th next. A couple of the prizes will be offered to the two vehicles which, in the opinion of the Organising Committee, are the most interesting, and one each to the German and foreign built vehicles which make the next best times to the winner of the contest.

The Herkomer Touring Trophy Contest.

June 5th has been definitely fixed as the start of the Herkomer Touring Trophy contest, the reception of the cars taking place in Dresden on June 4th. Entries at ordinary fees will be received up to the 15th inst., and at double rates until May 15th.

Public Services in Germany.

Negotiations are in hand for the establishment of a public motor-car service between Gressen, Gleiberg and Krofdorf. A company is also being formed to inaugurate a service between Oldenburg and Wardenburg.

The three Benz Cars which have been entered for the forthcoming Targa Florio Race in Sicily. The vehicles, which are of 50-h.p. and weigh when in running order 1,250 kilog., in accordance with the regulations, will be driven by the Duke of Bojano, Herr F. Erle and Herr P. Spamann.

Paris. So far about twenty-five entries have been received, these including a Spyker, an Itala, a Panhard, two Metallurgiques, and three De Dions.

A French Touring Trial.

The Automobile Club of Poitiers is organising an interesting touring competition for May 20th, which will comprise a long-distance run, a hill-climbing test, and a brake trial. The competitors will be divided into the following classes:—1, single-cylinder cars of a maximum cylinder diameter of 105 mm.; 2, ditto, over 105 mm.; 3, two-cylinder cars, maximum bore 85 mm.; 4, ditto, over 85 mm.; 5, four-cylinder cars, maximum bore 110 mm.; and 6, ditto, up to 140 mm. bore. For the vehicles in Classes 1 to 4 the distance is 170 kilometres, and for those in Sections 5 and 6 280 kilometres.

Motor Vehicles and the Postal Service.

Some trials are at present being made by the Post Office Department in Vienna with a number of electric motor carrier tricycles in connection with the rapid collection of letters. In France the postal authorities are inviting tenders until the 26th inst. for the transport of the mails in Paris by means of motor vehicles. The contract, which calls for the supply, maintenance, and working of 73 cars, with an additional ten as a reserve, is to come into operation at the end of September, 1908.

The Hotchkiss Tour of France.

The tour of France by the Hotchkiss six-cylinder car is nearing its end, about 5,000 miles having been covered up to Sunday last. During the past week M. Van Marcke has visited Rouen, Amiens, Lille, Cambrai, Chalons-sur-Marne, Montbéliard, Besancon, and Lyons. He is due to reach Paris on Friday, the 5th inst., when a dinner will be given at the A.C.F. by the Hotchkiss Company in celebration of the completion of the event.

Miscellaneous Items.

The Hungarian Automobile Club proposes to hold an international touring competition during the coming summer. The projected route is from Budapest to Temesvar and back.—A garage capable of accommodating up to 700 cars is to be established behind the grand stand, at the starting point of the Grand Prix race, near Dieppe.—The French Government has given the necessary official permission for the holding of the Criterium de France and Coupe de la Presse contests in August next.—A public motor-car service for the transport of both passengers and goods is about to be started between Rheims, Jueux, and Rosnay, France.—A number of taximeter motor-cabs have just been put in service at the Hague, Holland.—A motor Volunteer corps is being formed in Hungary.—Forty-two entries have so far been entered for the trial of industrial vehicles which is to be held by the French Automobile Club from the May 20th to June 10th next.

THE GERMAIN SIX-CYLINDER CAR.

AMONG the many excellent cars which are being turned out in Belgium, none are probably more popular either in that country or in England than the Germain. For some years the makers have confined their attention to four-cylinder vehicles, but at the last Paris *Salon* they exhibited for the first time a six-cylinder model which attracted considerable attention. We have already given a few brief particulars of the new car, but as there are several noteworthy features in the design, the fuller description we are now able to publish, together with the detail illustrations, will no doubt be of interest.

The frame is constructed of pressed steel, the side members being, as will be seen from Fig. 1, bent upwards at the rear to reduce the angularity of the cardan shaft, and also to allow plenty of room for the movement of the rear axle under the influence of the springs without unduly raising the body from the ground; in front the width of the frame is reduced to per-

noteworthy. In place of the usual wide bearing between each of the crank throws there is a disc formed solid with the shaft; the periphery of the disc is grooved out to form cups or races for the ball bearings, the corresponding outer cups being made in large diameter rings suitably carried in the lower half of the crank case, and within which the discs of the crank shaft rotate.

The ignition is by a gear-driven Eisemann high-tension magneto, a new departure being the coupling up of the governor to it, so that the sparking is automatically advanced and retarded. An auxiliary ignition by accumulators, in which the magneto distributor is employed together with its coil, can be fitted, if required. The carburettor, which is of the float-feed spray type, with automatic air control, is situated on the exhaust side of the engine, an overhead induction tube conveying the mixture to a horizontal distributing pipe connected with the inlet valve chambers. The water circulation is maintained by a gear driven pump—the spindle of which has a very long bearing—and a honeycomb radiator set in an oval-shaped radiator, which, with a motor bonnet of corresponding design, gives the vehicle a

Figs. 1 and 2.—Elevation and Plan of Chassis of Germain Six-cylinder Car.

mit the steering to have a very wide range. The engine, which is supported directly on the main frame by means of three brackets on each side, comprises six separate cylinders, these being made, as usual with the Germain Company, of steel with brass water-jackets; the dimensions are 120 mm. bore by 130 mm. stroke. The cylinder heads and valve chambers are cast in one piece and fastened to the cylinders by the bolts seen in Fig. 3, special provision being made to obtain perfect water-tight joints. They can thus be readily detached to enable any carbon deposit due to over-lubrication to be removed. The brass water jackets are fixed by steel rings shrunk on, without any brazing whatever. The valves are located on opposite sides of the engine, and are mechanically operated. The cam shafts are situated within the crank chamber, and driven by gear wheels enclosed in an extension of the crank case in which they run in oil. The bottom half of the base chamber can be removed without in any way disturbing the crank shaft. The arrangement of the latter with the object of keeping the overall length within reasonable dimensions is particularly

distinctive appearance. The radiator is provided with a belt-driven air-inducing fan, the belt tension being easily adjustable by means of an eccentric bearing. The water connections are on simple lines, a single horizontal pipe connecting the heads with an inclined lead to the radiator, while the lower portions of the jackets are similarly coupled together, except that the connection to the pump is made between the two central cylinders. The speed of the engine is regulated by means of a lever on the steering wheel acting on a variable lift to the inlet valves. Each lifter has a quick-pitched thread cut on its upper end, over which fits a cap. The six valve-lifter caps are coupled by means of small arms to a horizontal rod, the movement of which, by means of the lever on the steering wheel, rotates the caps and lengthens or shortens, as required, the effective length of the lifters. A throttle valve is also fitted in the induction pipe, this being connected to a pedal in proximity to the clutch pedal, so that both may be depressed together and the engine thus prevented from racing when the clutch is withdrawn. The normal speed of the

motor is 1,000 revolutions per minute, at which about 50-h.p. is developed. As regards the lubrication, a large oil tank working under pressure from the exhaust is fitted inside the bonnet; and on the dashboard is mounted a drip feed lubricator, which supplies oil to the engine, gear-box and live axle. Holes and channels are formed in the crank shaft, which is cut from the solid forging, to enable oil to pass to each of the big ends, and so ensure perfect lubrication.

The clutch, which is of the multiple metal disc type, is contained in the centre of the flywheel, where it runs in oil; the flywheel, the cage holding the plates, the casing, and some of the

Fig. 3.—View of a Germain Steel Cylinder and separate Cast Iron Head.

plates themselves are shown detached in Fig. 4. An outside clutch spring is employed, situated above the main shaft, and easily adjustable, while a braking device is provided to slow the primary gear shaft to facilitate speed-changing. The clutch is so arranged that it can be taken down without disturbing the spring or any other part of the mechanism. The change-speed gear gives three speeds forward and reverse, and is controlled by a lever, which works in a straight-through quadrant constructed so as to do away with the necessity for a trigger on the lever itself. The quadrant is mounted on small springs so that it is forced bodily outward when changing gear, and flies back into position directly the lever comes opposite to a notch. On the top speed the drive is direct, this being obtained by sliding one of the pinions within an internally-toothed wheel. The gear shafts are supported on

Fig. 4.—The Germain Multiple Disc Clutch dismantled. Only two of the Discs are shown.

ball bearings, and the gear rings are bolted to steel centres forming part of the shafts.

The final drive is by a cardan shaft to a live axle, which latter is also of an interesting design. The road wheels are carried on the sleeve or casing surrounding the live axle, the outer ends of which are extended and turned over to form, as it were, the hub caps, which are bolted to the wheels. By removing these bolts the cap and the half axle can be readily drawn out. The sleeve is made in four parts, the two tubular portions being secured to the differential casing, which is itself divided horizontally. The differential gear, as will be seen from Fig. 6, is of the spur pinion type. A substantial torque rod extends from

the axle casing to one of the cross members of the frame, on which it is supported in a spring bracket.

Irreversible wheel steering is fitted, adjustable for back-lash. The column is set at a comfortable angle, and passes through the dashboard to the inside of the bonnet, and the bar coupling the front wheels is placed behind the axle to protect it from injury. Three metal-to-metal brakes are provided, one situated immediately behind the gear-box being foot-operated and of the contracting type, and two internal-expanding brakes working within drums connected with the hubs of the rear wheels, actuated by a side lever.

Fig. 5.—The Three-speed Gear-Box.

The frame is supported on semi-elliptical springs at the front and three-quarter elliptic at the back, the latter having shackles only at the rear end. The wheel base of the vehicle is 11 ft. 2 in. and the available space for the body behind the dashboard 9 ft.

From the foregoing description it will be seen that the new Germain six-cylinder car, for which Captain Theo Masui is the British agent, should prove an excellent touring car, and one that should give as excellent results as regards reliability as the four-cylinder models.

THE first public auction of motor-cars in Dundee took place on the 29th ult.

PART six of the catalogue of Messrs. Alfred Herbert, Ltd., of Coventry, deals with the firm's milling tools exclusively.

Fig. 6.—The Differential Gear on the Germain Six-cylinder Car.

MESSRS. CULROSS AND SPROSTON, LTD., of Leeds, have published a Directory of Manufacturers and Wholesale Importers and Exporters on the North Eastern Railway system, which is issued in consonance with the policy of this enterprising company of attracting new industries to its territory. Apparently the railway realises that the best way to achieve this is to endeavour to augment the trade and prosperity of the manufacturers along its system. The directory, which contains upwards of 600 trade headings, presents in handy form the names and addresses of manufacturers, &c., handling any specific product, and, as it is also classified under "town" headings, should be useful to both buyers and sellers.

MOTOR-CAR CONSTRUCTION IN HOLLAND.

A VISIT TO THE SPYKER WORKS.

HOLLAND has so far not taken a very important place in the list of motor-car manufacturing nations, there being practically only one large factory in the country. The vehicles produced in this, however, bear such an excellent reputation, not only at home but also in England and in France, that we were pleased to avail ourselves of the invitation which Mr. F. F. Wellington, the manager of the British Automobile Commercial Syndicate, the head British agents, extended to us the other week to run over to Amsterdam to inspect the Trompenburg Works, where the Spyker cars are being turned out in steadily increasing numbers. It was a pleasant little party which foregathered at Liverpool Street Station, where the evening boat train for Harwich was taken, and with no untoward incident the Hook of Holland was safely reached about 5 a.m., and Amsterdam a couple of hours later. Our stay in Holland extended over a couple of days, and, thanks to that excellent means of modern and comfortable travel—the automobile—we were able during that short time to see a considerable stretch of the country, and to gain some idea as to its suitability as a

The illustration given herewith depicts the factory as it appears from the river; in it are located the general and drawing offices, while to the rear is a large single storey building divided into a number of departments—among others the heavy and light turning shops, the milling department, the radiator shop, the chassis erecting room, &c. As we passed through the various departments we were able to note the up-to-date character of the machine tools, which include some special bevel-gear cutters, cylinder and crank-shaft grinding machines, &c. "Automatics" are made use of to a considerable extent, while, the work being largely standardised, jigs are freely employed. The finished parts all pass to the stores, whence they are issued to the fitting and erecting shops, in the latter of which close upon twenty cars were on the stocks at the time of our visit. A recent addition to the factory is seen in a large detached three-storey building, the ground floor of which has been equipped with automatic machine tools of the latest approved type, these being fully engaged in the production of the smaller components of motor vehicles. Considerable time was spent in the upper storeys, where the always interesting operation of "fitting" is carried on. Here the visitors were able to see the various parts of the Spyker cars being assembled, the points of interest in the engine being the special method of lubrication, the oil being sprayed on to the

General View of the Spyker Factory at Amsterdam.

touring ground for British motorists. With this latter subject we propose to deal in a subsequent issue, confining ourselves on the present occasion to the more serious portion of our visit to the land of *mynheer*.

While breakfasting a messenger brought the news that two cars—naturally Spykers—had arrived to convey us to the factory, which is situated on the banks of the wide river Amstel, about three miles from the city. It was well that our drivers knew the way, for all the narrow thoroughfares bear a notification in Dutch that they are closed to motor-cars, while the numerous bridges across the canals, which form so striking a feature of Amsterdam, require careful negotiation. Eventually leaving the last of the tram-lines behind, and just as we began to approach the open country, our cars pulled up outside an imposing building, where Mr. John Spyker, the head of the Trompenburg works, was waiting to receive us. After the necessary introductions, a start was immediately made on an inspection of the works, which we found to be of an unusually complete order, as may be judged from the fact that, except the forgings, castings, and other raw materials, which are mainly obtained from England, all parts of the cars are turned out in the factory, which derives its name from Admiral Van Tromp, of masthead "broom" fame, who lived on this spot in times gone by. As a further indication of the comprehensive character of the undertaking, it may be stated that even the pressed steel frames, the radiators, and the bodies are of the firm's own manufacture, much interest being shown by the visitors in the machinery installed for this purpose.

moving parts and the ball-bearing crank-shafts. The change speed gear is not only of liberal dimensions, but the large inspection lid to the gear-box and the ease with which it can be removed and replaced are not the least important features of the design. Then, as regards the transmission, which is by a cardan shaft to a live axle, the form of the universal joint and the arrangement of the axle sleeve so that no irregular strain shall be thrown on the axle proper, both came in for careful scrutiny, it being apparent that much careful thought has been given to these portions of the car's anatomy in order that they shall withstand the roughest usage.

To the rear of the main buildings is another series of large premises, in which are located the engine room and boiler shed, which alone give an idea of the importance of the Spyker undertaking. Steam is supplied by boilers of the Babcock and Stirling types, while the engine is a fine example of a modern horizontal compound built by Bollinckx, of Brussels. This drives by a series of ropes a large dynamo, which supplies the necessary power to the various departments and the factory, which are all electrically operated. In the adjoining buildings are housed the smithy and the engine-testing shop, where the motors for Spyker cars are all subjected to a brake test ere being fixed in the chassis. Passing again through the erecting shop we crossed the street, where, adjoining a long row of houses belonging to the firm, and in which many of the workmen and their families live, we visited still another large three-storey building, entirely devoted to the body-building department and the necessary adjuncts of upholstery and carriage painting departments.

Established originally for the manufacture of horse-drawn carriages, Mr. Spyker has taken a keen interest in the automobile movement since the early nineties, and some eight years ago produced the first car, a vehicle on Benz lines, while in 1902 one of the first, if not the first, six-cylinder cars here first saw the light. Since that time the factory has been gradually extended, until now it gives employment to about 550 persons, and is turning out seven or eight cars a week. Further extensions are in hand which, when completed in the course of a month or so, will enable the number of hands to be increased to over 700, and the output of cars to from ten to twelve, while that there is ample room for still greater expansion is seen in the fact that the site of the factory is about ten acres in extent. At the present time four sizes of Spyker cars—10-15-h.p., 15-20-h.p., 20-30-h.p., and 30-42-h.p.—all fitted with four cylinders, are being built, the latest addition to the list being the 10-15-h.p. chassis designed for use as a motor-cab. While following the general lines of the Spyker vehicles, the new car, which will make its *debut* in England at the Cordingley Show, comprises a number of new features, notably the engine, which has the four cylinders cast *en bloc*.

From the inquiries we made it would seem that Amsterdam in general, and the Spyker works in particular, in view of their

Leaving the Spyker Factory for a run to Utrecht. At the wheel of the leading car is M. Godard, who will drive a Spyker in the Pekin to Paris Trial.

competence, are in somewhat an unique position, not merely for the construction of motor-cars on a large scale, but, what is most important, for building them at a comparatively low cost. The reason for this is found in a fortuitous series of circumstances. In the first place, although, in order to attract good workmen, the rate of wages at the Spyker factory is higher than the average at Dutch engineering works, yet it is somewhat lower than in England, and, secondly, labour troubles are extremely rare. Again, the excellent means of communication and the relatively low freights for water carriage enable not only the raw material to be brought to the very gates of the works, but the completed cars to be shipped to England and elsewhere at a minimum of cost. In fact, it was with some surprise that we learned from Mr. Spyker and Mr. Wellington that it is possible to ship a car from Amsterdam one day and receive it in Long Acre, London, W.C., the next, and that at a cost ranging from 22s., according to the size of the car—a figure which will certainly excite the envy of many manufacturers who are compelled to despatch their cars from the factory to the depots by rail. With such a combination of favourable conditions it is, of course, not surprising that the Spyker cars should have taken so high a position in the automobile world, a position which, as our visit to the works enables us to testify, it is the intention of those at the head not only to maintain, but to leave no stone unturned to improve.

The business portion of our excursion over, the remainder

of our stay in Holland was spent in two delightful excursions *en automobile*, Mr. Spyker not only placing a couple of his cars at the disposal of the party, but accompanying his visitors on a run from Amsterdam to Utrecht and back *via* another route, and in a trip to Haarlem and Zandvoort, a rising seaside resort, some details of which, and the impressions gained of the suitability of Holland as a touring country, we hope, as already mentioned, to give in a later issue. In the meantime, it must suffice to say that the vehicles did not belie their reputation for reliability, and the puncture demon for once looking another way, the outing proved one of the most enjoyable we have had for a long time.

CLEANING THE SILENCER.

WHY should it be taken for granted that the silencer is something that need never be taken apart, asks a writer in an American contemporary. That its design in numerous instances has been based upon this assertion is evident, but the reason for so doing is not quite as apparent. Of course, any silencer can be taken apart, and so can a locomotive boiler, but it is plain that the value of the object will disappear in the process, and this must always be the case with those types of silencers in which the design and construction are of a nature that precludes a revelation of their interiors without resorting to the hammer and cold chisel. The necessity for taking the exhaust-box to pieces does not occur often, probably never more than once in a season, and in the majority of instances a car is usually run without attention to this essential until its condition makes it imperative. After two or three years' exposure to wind and weather a silencer is bound to prove a difficult thing to dismantle despite any provisions made to this end, as rust and dirt combine to form a powerful union between threaded joints. No matter how thorough an overhauling may be given a car preparatory to a season's use, the silencer is apt to be overlooked. It is not generally considered as a part that is in need of inspection. That this is an entirely erroneous view, however, is well appreciated by every motorist who has seen a silencer dismantled after one or two seasons' use. Nor is there any question in the minds of those who have gone to the trouble that it is a proceeding that pays. Some people have their house chimneys cleaned regularly and others wait until they choke with soot and fill the house with smoke; this seems to sum up the situation where the silencer is concerned. Except that in this instance those who wait till the last finally come to the silencer in search of the cause of diminished power in the engine. At some time or other in its history every car is run with too rich a mixture or with an excess of lubricating oil, and these circumstances are combined more or less often according to the care of the driver. Every time they happen there is a deposit of soot varying with the degree in which these adverse conditions present themselves, but even proper adjustments throughout are productive of soot to some extent and some of it remains in the passages of the silencer. This is certainly a good reason why it should be well cleaned at least once a year, and an equally good one why it should be so constructed that it can be cleaned without having to practically rebuild it after the process.

THE Road Committee of the Chelmsford Town Council has called attention to the excessive speed at which motor-cars travel at cross roads in the town without sounding an alarm, and said they had directed the town clerk to look up the law upon the matter and to advise if some regulation on this point could be issued.

MESSRS. SHORT BROS., as an example of the rapidity with which ballooning is being popularised in this country, inform us that since the opening of their new balloon factory at Queen's Circus, Battersea Park, S.W., last June, they have superintended no less than sixty-one balloon ascents for private members of the Aero Club, involving a total of 2,745,000 cubic feet of gas and 234 passengers.

SOME CURRENT TOPICS.

Brakes.

Special attention was devoted by M. Perissé, in his statistics of the recent Paris *Salon*, to the subject of brakes, the section dealing therewith being one of the longest in his return. He deals firstly with the rear wheel hub brakes, and shows by the following table how rapidly the internal expanding type has ousted the contracting variety from the premier position.

Rear Wheel Brakes.	1903.	1904.	1905.	1906.
	Per cent.	Per cent.	Per cent.	Per cent.
Internal expanding type	44	82	91	90
Contracting type...	56	18	9	10

steel. Both these have, however, given way slightly to steel on steel brakes, which once more show an advance, as will be seen from the following comparative figures:—

	1903.	1904.	1905.	1906.

Repairing a Badly-Worn Foot Brake.

If a car has been run a considerable time, say well over a year, with but scant attention, the foot brake may have become so worn as to be quite inoperative. Examination will probably show that both the drum and the shoes are worn: the latter have gone first and then worn the drum unevenly, and eventually have worn it so thin as to render it unserviceable for further use. Let us commence with the drum. This must be dismantled and

Between Kertosono and Bjonibang, Java, flows the wide Brantas River, which is spanned by a railway bridge. As this is the only means of communication, motorists are conveyed across by rail in the way depicted in the above illustration.

(De Auto.

As regards foot brakes—60 per cent. of which are on the end of the shaft from the gear-box and 40 per cent. on the differential shaft and other points—it was found that the contracting type is still the most favoured by motor-car manufacturers, this form being employed on 61 per cent.; this is, however, a decrease as compared with last year, when 75 per cent. was recorded. On the other hand, internal brakes have advanced from 25 per cent. to 39 per cent.

The Material for Brakes.

While the metal-to-metal brake is now almost universally employed, a good deal of experiment appears to have been made in the direction of arriving at the right materials to use for the two frictional surfaces, those most largely adopted at the present time being cast iron on steel, followed by phosphor bronze on

put in the lathe, and its surface turned reasonably true. If there is a flange it must be turned off. A mild steel ring must then be forged and next turned inside, just so small that it will only start to go over the drum. This ring must be made red hot, when it will, with a few taps, go over the drum. It must then be cooled off in water quickly, and it will become "shrunk on." The drum is then put in the lathe and turned to its correct size, and the ring may be additionally secured by a few rivets. Coming next to the shoes, these are easily disposed of. Rivet on good liners of copper and fit same to the drum, so that they "bite" evenly when the brake is on, and come clear away when it is off. This is not at all a complicated repair, and is one that any good mechanic can do. It is not expensive, being a good deal cheaper than a new drum, and if the car happens to be a fairly early model, there may be some difficulty in getting the exact article.

A NOVEL SPEED INDICATOR.

A NOVEL speed indicator has lately been devised by Mr. Lawrence Mott, an electrical student at Harvard University, U.S.A. The device, which is being put on the market by a Boston firm, is simple in construction, the working parts being a pair of flat centrifugal weights pivoted on a vulcanite disc, which is bolted close to the hub of either one of the front or rear wheels of any motor-vehicle. The weights are connected by links, so as to work in unison, and are drawn in by springs. As they fly out by centrifugal force, due to the rotation of the wheels, a contact brush carried by one of them moves across a series of four contacts connected in circuit with an equal number of collector rings mounted on the opposite side of the disc from the weights. Brushes fixed to an insulating support on the axle casing press against these rings, and are connected by wires with a series of four small glow lamps grouped on a porcelain base fixed to the dashboard. A return wire leads from the lamps to a battery of dry cells located in a convenient place on the vehicle, and from thence through the metal of the wheel bearings back to the weights. The lamps have globes of different colours and become illuminated in succession as the different speeds are

reached. The device, as now put on the market, indicates four speeds, viz., eight, fifteen, twenty, and twenty-five miles an hour, although they can be equipped for higher, lower, or intermediate speeds. A lacquered casing protects the weights and their contacts from dirt and mud. One of the principal claims made for the device, in addition to its simplicity, is the fact that the indicating devices are mounted directly in front of the driver, who can perceive his speed at a glance without appreciably diverting his attention from the road, by simply noting the particular colour of light which burns. The lights show readily in the daytime, and, of course, have the advantage of being conspicuous at night. No driving connection from the wheel is necessary, as the weights are on the wheel, and the only connection from the wheel to the body is an electrical one. The weights are opposite acting and counterbalanced by each other, so that any position which they assume under the influence of the speed of the vehicle is not disturbed by vibration due to the roughness of the road. Speed plays so important a part in motoring that the need of some convenient and approximately certain method of gauging it has always been felt. The marked increase in the number of motor-vehicles, and the consequent activity of the authorities in many districts to repress all speed excesses,

real or alleged, has but made the need more plain. There is scarcely a motorist to whom an instrument capable of gauging his exact rate of speed does not appeal. Quite aside from the satisfaction he may feel at knowing just what he is doing, whether it be up hill or down or on the level, there is the certainty that he cannot go wrong unintentionally when he has a faithful companion of this sort.

SOME USEFUL NOTES.

THE stiffness of the body springs of new cars is proverbial, and it is only after some little use that they acquire their expected easy riding qualities. Careful driving over rough roads is advisable with a new vehicle, in order to bring the springs into condition with the least amount of general wear and tear.

It often happens that in the process of making the petrol tank small pieces of solder, soldering flux or metal are left within it. These pass out through the petrol pipe, and it is not uncommon for a new car to exhibit carburettor troubles, due to the filtering screen becoming clogged with this foreign material. The petrol strainer of a new vehicle should consequently be cleaned and the float chamber flushed out after they have been in use for a short time.

IN the case of an inner tube which always goes down when inflated on the car, and yet reveals no puncture or leak when tested, it is fairly certain that the cause is one or the other of the following:—(1) The valve seating is leaking where the valve is secured by a nut. This can usually be discovered by blowing up the tube as hard as is safe, and when under water, catch hold of the valve and bend it over in all directions. The cure is simple. Tighten down the nut. (2) The tube is porous, in which case it is useless.

THE road wheels are frequently neglected by owners and drivers. They are really very important and should be carefully attended to from time to time, more particularly those with plain bearings. The leather washers in these wear after a certain time, and cause looseness in the wheels, which is very bad. Ball bearings require periodical examination, as sometimes, through faulty hardening, a ball race is a bad one, and consequently the more the car is run the more damage is being done. If a car is in regular daily use, the wheel caps should be filled with grease and oil every 500 miles.

TIME spent in an occasional thorough cleaning out of all oil passages, lubricators and cases containing oil on a petrol car is by no means wasted. The use of paraffin is most effective in this work. It should be allowed to run rapidly through oil cups until all dirt and gum is removed, and it should be forced through all oil passages and pockets. Gear and crank cases should be liberally supplied with paraffin and the liquid then rapidly drawn off, when it will carry with it the minute metallic chips and dust which frequently accumulate, as well as draining away the gummy portions of the oil. When all internal parts are clean, and all oil-ways clear, one may expect lubrication to be effective.

TYRE covers with a burst in them should not be scrapped. They are useless for retreading or repairing in the ordinary way, but they can be made into a serviceable spare cover—good for at least another 500 miles—if repaired as follows. Suppose the burst to be four inches long. Take a good section from a disused cover of the same cross section ten inches long. Remove the beads from it, and carefully trim it down with a sharp knife, thinning it as it approaches the beads of the existing cover. When a suitable inside gaiter has, so to speak, been obtained, carefully fix it by pure solution centrally under the burst. To be of any service this inside gaiter must be secured otherwise than by solution alone, so rivet it with copper rivets to the wall of the cover each side. A further lining of canvas will be necessary inside to cover up the heads of the rivets.

THE headmaster of Eton has been appealing to the parents of boys at that school not to call for their sons in motor-cars on Sundays.

A NOVEL feature in the district council election at Beckenham was a motor-car placed at the disposal of any of the candidates, irrespective of party. The car, which was labelled "Vote for the best man," was driven all over the district and conveyed many voters to the poll.

It is becoming quite the fashion to adopt a distinguishing mark on the radiators of cars. Following the example, Captain Theo Masui, the British Agent-General, has sent us a specimen of the marks which are now being fitted to the radiator and hub caps of the German cars. These take the form of artistic multi-coloured plates with the Belgian lion and the arms of the town of Charleroi set in a shield, which is surmounted by the monogram A.G.—the Ateliers German—where the vehicles are built.

CAPTAIN DEASY started his 1,000 mile reliability trial from the Irish Automobile Clubhouse, Dublin, on Tuesday, and, after an uneventful run, reached Cork just before darkness, covering a distance of 173 miles.

MESSRS. STRADLING AND PLENTY, whose motor garage at Newbury has been enlarged three times since its erection, are now making a further extension, which will give them facilities for accommodating thirty more cars.

THE entries to date for the International Tourist Trophy Race for Motor Cycles are: Mr. M. J. Schulte, 2-h.p. Triumph; Mr. H. A. Collier, 2-h.p. Matchless; Mr. H. G. Cove, Minerva; Mr. Albert Brown, Brown; and Mr. C. B. Franklin, J.A.P. motor-cycles.

MESSRS. B. H. THWAITE and R. F. Thorp will read a paper on "The Renard and Surcouf Road Train system, at a meeting of the Society of Engineers at the Royal United Service Institution on Monday next. This will be of interest to those who see the Renard train at Cordingley's Motor Show.

MESSRS. JARROTT AND LETTS have just received an interesting piece of news from Monte Carlo, to the effect that two Crossley cars have received awards in the Concours d'Elegance held at Monte Carlo last week. Mr. Jarrott on his 30-40-h.p. Crossley, which has just broken all records to Monte Carlo, received one of the awards, and the other was gained by Mr. Claude Borrett on his 40-h.p. on which he is touring round France.

TWO of the largest motor-omnibuses in New Zealand have just been put into service in the Hawkes Bay district. The vehicles, which are of British construction, were assembled and placed in running order by the Wellington and Wairarapa Motor Company, Ltd., at their new garage, Cuba Street, Wellington, N.Z.

THE General Committee of the Scottish Automobile Club is drawing the attention of members of the club, motor-car drivers, and the motor trade north of the Tweed generally, to the provisions of the Prevention of Corruption Act, 1906, and is inviting the co-operation of every person interested, in order to secure a strict and rigid observance both of the letter and of the spirit of the Act.

HERE AND THERE.

APPLICATION for a speed limit of ten miles an hour is being made at Ware.

MESSRS. HILLIER AND COMPANY, whose garage is on the main road between London, the New Forest and Bournemouth,

kept their Camperdown Motor Works, on the Winchester road, Romsey, open throughout the holidays for the convenience of touring motorists.

THE 40-h.p. Siddeley car now under trial for long distance travelling by the Royal A.C. has nearly completed a journey of 6,000 miles—a trip that, commencing on February 12th, has been continued in all "samples" of weathers, on all conditions of roads, and in many different counties. In Scotland a snow-drift was encountered on the Spital of Glenshee, and other difficulties have been got over with credit in the northern part of this island. Now the car is coming south again, and is expected back in London towards the end of the month.

MR. D. W. WILLIAMS, the United States Consul at Cardiff, gives the reduced demand for carriage horses in this country, owing to the advent of the motor-car, as a reason for the increased exportation of horses for food in certain Continental countries.

AFTER exhaustive enquiries and trials of various wagons by their engineer, the County Council of Rangitikei, New Zealand, have purchased a steam wagon from Messrs. Norman Heath and Co., Wellington, who represent Messrs. Sidney Straker and Squire, Ltd.

IN Bombay, Calcutta, and Madras are up-to-date motor-car establishments well able to supply the requirements of Government officials desiring to become possessed of motor-cars. Consequently the "Indian Motor News" expresses surprise at the attempt now being made in high circles in the Dependency to prohibit such officials from purchasing them in the country.

THE feature of the holiday traffic in North Wales on Saturday was the extraordinary invasion of motor-cars into the towns. There were hundreds of cars along the Holyhead main road, and the clouds of dust they raised was the subject of general complaint. The walking tourist, with knapsack slung across his back,

now a familiar figure in North Wales, kept away from the beaten track.

FROM Balfour House, Finsbury Pavement, E.C., comes a catalogue of the Heinz accumulators, for which Messrs. Snowden, Sons, and Company, Ltd., are the sole agents in this country. The list is prefaced by some useful general instructions with regard to charging batteries and the upkeep of accumulators, following which particulars are given of the various types of ignition accumulators for cars, voltmeters and ammeters, etc., in which the firm is interested.

MR. C. HOODONK, whose establishment at 6, Leather Lane, Holborn, E.C., is the London depot for the "Dependence" lamps made by Messrs. J. and R. Oldfield, has issued a new list for the season, in which are given particulars of various specialities for which he also acts as agent, including Bassée Michel coils, Ossant silencers, Longuemare carburettors, "Bercley" motors, "Janus" motors, steering wheels, motor horns and various sundries for motorists.

THE Grand Duke Franz Ferdinand of Austria has just acquired a 45-h.p. Mercedes car.

AMONGST the latest purchasers of the 40-h.p. "Weigel" chassis are Lord Wandsworth and Sir Hugo de Bathe.

THE long-expected Commercial Vehicle Trials are now announced for September 9th; the regulations will be issued in a few days.

MR. C. D. ROSE, M.P., the new chairman of the Royal Automobile Club, has placed an order with Messrs. J. E. Hutton, Ltd., for one of the new six-cylinder Mercedes chassis.

WHILE motoring from Frogmore to Windsor on Good Friday the Prince of Wales was able to render "first aid" to a horse vehicle that had overturned on the roadside.

The Germain Six-Throw Crank Shaft, showing Circular Crank Webs which act as Crank-shaft Journals. (See page 105.)

MR. JAS. McCONECHY, of 113, St. George's Road, Glasgow, sends us a photograph showing a cross section of his patent corseted walls, as applied to an ordinary tyre cover. The corseting occupies a position in the centre of and outside the cover fabric, the cords being bedded in soft rubber, and covered with a separate canvas lining. They are claimed to prevent undue lateral flexion of the cover walls—throwing or directing the pressure from the air tube from the rim directly on to the crown head or tread of the tyre. When the tyre is under compression the corseting, acting as it does as a fulcrum for the direction of the pressure contained in the air tube, changes the compression from the lateral to the vertical plane, the advantage being that the resilience produced by vertical compression is more acute. The patent compressed combination tread introduced by Mr. McConechy has great wearing and road gripping qualities.

A 40-H.P. Napier car, entered by Mr. S. F. Edge, started on a 500 miles long distance trial under club regulations and observation on the morning of the 26th ult., after being passed by the Technical Committee. The car was entered that the consumption of oil in the engine might be tested. It went to Southampton and back, a distance of 151 miles. On the following day the route was to Bath and back, a distance of 212 miles, and on the 28th ult. the route was to Daventry and back, 147½ miles, which completed the test, and the car was then examined and released from observation.

WE learn that the Star Cycle Company, Ltd., of Wolverhampton, are about to place on the market a new car, which will be known as the "Royal Starling." The vehicle has a 10-h.p., two cylinder engine with a bore and stroke of 3½ in. by 4½ in., and is controlled by a variable inlet. The change-speed gear gives three speeds forward and a reverse, and the transmission is by cardan shaft. The gear-box and live axle are provided with Hoffman ball bearings. The new car, which can be fitted with either a two or four-seated body, will make its debut at the Cordingley Show at the Agricultural Hall.

THE CONTINENTAL TYRE COMPANY are supplying car buffers of the best rubber in various styles. One model is provided with a base of hard vulcanised rubber; another is specially suitable for fixing on round axles and a third description is intended for small vehicles. The use of buffers has not always received due consideration from motorists and the Continental Company will be pleased to advise car owners on their utility.

MR. A. H. BURNAND, A.M.I.Mech.E., has been lecturing, before the Hartley University College Engineering Society, at Southampton, on motor-cycles.

AN Argyll motor-car is being employed by the "Liverpool Courier" for the delivery of papers at Chester, in order to catch the early mail train to North Wales.

MESSRS. SAYERS AND COMPANY, who came into public notice at the Cordingley Motor Show of 1906, have Stand Nos. 79 and 80 at the present exhibition, whereon they show many good examples of British carriage work as adapted to the purpose of the automobile. The work is of a very high grade.

IN view of their increasing business in the North of England the Daimler Company have found it necessary to take over additional buildings adjoining their present depot, at 60, Deansgate, Manchester. Extensive alterations are being made to these premises, which will henceforth be known as "Daimler Buildings."

"MOTORS and aeroplanes may be ordered for 10.15 p.m." was the announcement made on a hand-bill in connection with a concert held at Hersham Village Hall on Easter Monday.

DURING the Easter holidays several of the London dailies made use of motor-cars for the rapid conveyance of their papers to seaside resorts. Thus one of the light delivery vans of the New Leader Motors, Ltd., was employed in conveying supplies to Margate, and one of the cars of the Automobile de Luxe, Ltd., performed the same work as regards Brighton and Eastbourne, the papers in both cases arriving well in advance of what was possible by train.

THERE were many amusing incidents during the driving examination of the non-commissioned officers and men at Plymouth, owing to the examiners ordering the men down lanes and alleys that had never seen a motor-car before. On one occasion the examiners found themselves within a few feet of the edge of the Great Western Docks pier head with no alternative but to turn back.

MR. S. F. EDGE has recently had some tests made at the Northampton Institute, Clerkenwell, of the exhaust gases from a 40-h.p. six-cylinder Napier. Two samples were taken, one, A, at a point 28 in. away from the exhaust port of the engine, and the other, B, 35 in. away, after the gases had passed through the silencer. The following are the analyses by volume of the

Lower half of Base Chamber of Germain Six-Cylinder Motor, showing the Ball Races in position. (See page 105.)

samples, each analysis representing the mean of two others on the particular sample. The hydro-carbons represent the unburnt petrol gases and the CO² together with the oxygen and carbon monoxide should give an indication with the hydro-carbons of the nature of combustion:—

Mean of Samples A.			Mean of Samples B.		
% volume CO ₂	...	= 8.70	% volume of CO ₂	...	= 8.15
„ volume oxygen	...	= 2.75	„ volume of oxygen	...	= 3.50
„ volume carbon monoxide	= 0.30		„ volume carbon monoxide	= 0.95	
„ volume hydro-carbons	= 6.55		„ volume hydro-carbons	= 5.70	
„ volume nitrogen	...	= 81.70	„ volume nitrogen	...	= 81.70

CORRESPONDENCE

[Letters to the Editor should be addressed to the office, 87-88, Charing Cross Road, W.C.]

VARYING PETROL CONSUMPTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will you allow your columns to be opened to a discussion on the question of the great variation in the consumption of petrol in different cars? In your issue of the 30th ult. you mention a 40-h.p. Napier car owned by Mr. Justice Gorell Barnes, which was driven, under observation, on a consumption of one gallon to sixteen miles, including London street traffic. A Clement-Talbot car, 10-12-h.p., is stated, with four people, to have run fifty-seven miles on a gallon of spirit. I own an Alldays two-cylinder car which is about 11.5-h.p. This car will not run more than twenty-two to twenty-four miles to the gallon. I drive with my petrol throttle open as little as possible, and the spark well advanced, and average, perhaps, eighteen miles an hour. In driving the car into Kent from Birmingham, when one of their own drivers drove

run of punctures may be experienced. An inside and outside gaiter should be carried, as they are handy for bursts, when it is not convenient to fit a spare cover. A good pump in thorough working order is most essential with a spare rubber connection. Can there be anything more annoying than a pump which persists in leaking somewhere, and takes about three times as long as it should to blow up a tyre?

Let me pass on to other parts of the car. If the car be chain-driven, in addition to having spare links, bolts, &c., have a couple of spare chains, they take but little room, and save a lot of dirty work on the road, in the event of chain troubles. As regards the ignition, if low tension magneto, be sure to have all spare igniter parts and springs. If ordinary accumulator, or high tension magneto, have at least four spare plugs; the latter behave very oddly at times with no apparent reason, therefore a good reserve contingent is handy. The usual magneto spares, such as brushes and springs, and make and break parts, should be taken. When accumulators are used three good batteries should be carried, and never have them charged on the road, unless you know the people are competent. A spare piece of high and low tension wire is most necessary. As regards the engine itself, two spare valves should be carried and three springs, also several collars, if that method of fixing the springs be adopted; these last are little things and easily lost. Always have a good assortment of copper-asbestos joints of all likely sizes, and as well a yard or two of asbestos string, and last, but not least, four or five feet of medium copper wire. The tool outfit should always include a good hammer, a small cold chisel, and two good files and a

Touring in Egypt.—The Old Style and the New at the Pyramids.

the car, we used close on 10 gallons of petrol to drive the 220 miles. Again the same average by a nominally skilled driver.

Now with the h.p. developed, or rather the nominal h.p. of the engines, the Napier 40-h.p. car only uses half as much petrol again as I do, and the engines are nearly four times as powerful. Is the carburettor at fault, and what is the experience of drivers of light low-powered cars as regards their consumption of petrol? If any statistics could be arrived at, and comparisons made, as regards the usual consumption of petrol by light cars, some useful information might result, if my experience is in common with other drivers of light cars. If others experience what I do, it seems to me that we do not get nearly the results out of light cars for the petrol consumed that we ought to.—Yours truly,

D 2804.

WHAT TO TAKE WHEN TOURING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—What a large number of people start off on a tour without half their necessary equipment! If one really wishes to enjoy a motor tour, there must be freedom from breakdowns. Absolute immunity from trouble is not very often experienced, but it is most annoying to find that a trouble cannot be properly handled because something has been forgotten and left at home! Let us commence with tyres. One spare cover should always be carried; thanks to present excellence of tyres, it is not often necessary, but it should be there if required. At least three spare tubes should be taken; one never knows when a bad

small vice. A few spare bolts and nuts and washers and split pins of the usual sizes should not be forgotten. If one takes the trouble to fit out a car as described, there will be no difficulty in tackling any ordinary trouble on a tour.—Yours truly,

EXPERIENTIA DOCET.

NON-SKID EXPERIENCES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In these days we hear a great deal about the desirability of anti-skidding tyres, or, as the French call them, *Anti-dérapants*. Of course no one disputes the desirability of some invention—whether it be a tyre or what not—which will prevent, or even lessen, lateral skidding; but I for one must protest against the idea that anything can be invented, or should be called for, which will entirely suppress—or rather counteract—the force of inertia, especially when going around curves. The so-called “centrifugal force,” which after all is not centrifugal force, but tangential force, as the moving mass, no longer held to the centre, tends to keep on in a straight line tangent to the curve in which it has been revolving, is not to be suppressed in so summary a fashion as automobilists wish.

Given the case that a motor car is turning, or is intended to do so, and that the ground is too slippery to enable the curve to be “negotiated” as desired. We will assume that at the moment when slip begins it were possible to provide the tyre with a set of radial spikes which would absolutely prevent sidewise motion and only permit the wheels to rotate. If the velocity is very great, as is often the case,

one of these things must happen on the curve. As the wheel cannot slip sidewise, either the road material will be squeezed sidewise towards the circumference of the arc, or the wheel will be dished, or the axle will break, or the entire car will be turned over sidewise in the same direction. There is a speed at which the occurrences will be limited in number to those which will cause an accident; that is, the road surface will not give and the wheel will not skid, so the choice will be among axle-breaking, wheel-dishing, or car-overturning. No inventor can suppress the action of the natural force which we call momentum or inertia, and which acts in accordance with the fact that a body can neither start itself from a state of rest, nor stop or slow up when once in motion, without the action of a force outside such body. So the possession of a set of non-skiddable tyres must not make the motorist too confident, else he will either come to grief himself, or cause someone else to do so, or both.—Yours truly,

R. G.

PROGRESSIVE CHANGE-SPEED GEAR.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I thank Mr. Smith for his letter, but he does not answer my inquiry. I do not see that my letter stated the belt was a perfect device, but to me it does seem a very great improvement, and, if I remember aright, has nothing in common with the various belt drives of six or seven years ago. That it has not been taken up counts for little; the steam engine, the screw propeller, and even motors of more than one cylinder, scarcely met with enthusiastic receptions. Even the epicyclic gear, which has been exhibited for five or six years, has not yet been adopted by the majority of car manufacturers in this country. Still I am

The New Car Badge of the Motor Union.

glad to know that such a sweet running gear is in use on a 40-h.p. car, and that Mr. Smith finds it satisfactory. I regret I cannot accept his kind offer of a run on the same.—Yours truly,

R. HANNEN.

MOTOR LUBRICATION.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to "D.D.B.'s" article in the *M.C.J.* of the 23rd ult., on the above subject, I am glad to find that this gentleman agrees with me in so many of his statements. I must ask, however, to correct the impression which he would create, if his reference to myself were allowed to pass without comment. He says that I advocate the use of French chalk as a lubricative improvement when added to grease. My letter referring to Mr. Duncan's article mentioned:—"Then regarding the grease, I find that an admixture of French chalk is condemned because when the wearing parts have become hot, the grease melts. Now with such a grease, in which there is a proportion of mica (or, as it is otherwise known, soap stone, French chalk, or talc), if the oily portion of the grease melts, the mica is still left to act as a lubricant, and, although it is not so effective a lubricant as graphite, it answers the same purpose somewhat less efficiently. and its presence is certainly preferable to its absence. As a matter of fact, my firm never use mica in its motor grease, but, in its place, flaked graphite. Then as to the use of graphite on oil bearings, this is not desirable, because it chokes the oil ways, and, for the same reason, its use must be condemned in cylinders, as in this case it gets behind the rings, spoiling their elasticity, and ultimately leading to their breakage," by which I mean that if the grease melts and runs away, it would be better that such a grease should have contained some French chalk,

because it would be preferable to have the bearings lubricated with French chalk than running dry, owing to the fact that all the grease had melted.

I should like also to ask "D. D. B." to give figures indicating what he means when he speaks of a "heavy and light" oil, as the terms which he used are merely comparative. In my opinion it is a pity that "D. D. B." does not state his name and standing, because, otherwise, how can he expect anyone to attach much importance to a chatty article such as his, which contains so many statements which he does not proceed to prove, but gives simply as a matter of personal opinion?—Yours truly,

A. DUCKHAM.

EYESIGHT.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I note your remarks in the *M.C.J.* of the 23rd ult. on the eyesight of automobile drivers and the question as to tests. I should like to point out that this is a matter which will require very careful consideration and one in which any attempt at hurried legislation will end in failure.

The chauffeur is in quite a different position to the engine driver on the railway or the look-out on board ship; seeing at long distances is of less importance in his case than the quickness and steadiness of nerve necessary to decide what to do in an emergency.

For instance, a man with a considerable amount of myopia (short sight), uncorrected, might be a much safer and more reliable driver than one troubled with a much smaller amount of astigmatism; because in the former case, if it were merely uncomplicated short sight, there would be no eye strain and the individual's mental faculties need not necessarily be in any way impaired. But, on the other hand, one suffering from such a small amount of astigmatism that it would not prevent him passing all the ordinary visual tests might be terribly handicapped, because this defect causes eye strain, and that, strange to say, often in inverse ratio to the amount of the defect. To put it in figures, I would rather trust myself to be driven for a long period by a driver suffering from four diopters of myopia uncorrected than to one who possessed only half a diopter of astigmatism and did not wear glasses. The short-sighted person would see objects blurred at a distance, but, as forcing the accommodation of the eye would not help him, he does not do it, so escapes eye strain. The person suffering from astigmatism, however, is unconsciously almost all the time trying to correct the defect by attempting to focus or accommodate the eye; this produces eye strain, and the nerves are affected; he will be sure to relax his attention occasionally in the attempt to get rest, and may do this at the critical moment with disastrous results.

Defects of the muscular apparatus of the eye will, even when the sight of the eyes is good, produce the same troubles and are liable to upset the nervous system and render the sufferer unreliable as a driver.

Hypermetropia or long sight of small degree will also frequently cause eye strain.

I merely mention these facts to show that ordinary methods of sight testing, such as looking at distant objects, are not of much use in deciding the visual competence of a chauffeur.

As, however, all these defects can in most instances be corrected by means of glasses, they need not be any hindrance to the individual becoming a perfect driver; the difficulty is to make anyone who can actually see well understand that. Notwithstanding this, the headaches, eye strain, imagined biliousness, &c., from which he may suffer after a long drive, whether actually piloting the car or not, are probably due to a defect in the formation of the eye or the maladjustment of its muscles, and that a pair of glasses will in many cases relieve the whole trouble.—Yours truly,

JAMES AITCHISON.

SPARKING PLUG POSITION.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—A friend of mine and I have recently been interested in observing the difference between two 7-h.p. Panhards. One is a 1901-2 three-speed Centaur type, and the other a 1903 model with four speeds, enclosed radiator and wheel control. The 1901 car is much the better, I should say—fully a horse-power stronger. We have eliminated as far as possible all factors outside the engine. The bushes and gears are good and smooth in both. The weights we have adjusted. The engines are exactly the same with one exception—in the 1901 car there is a small explosion chamber in the plug bush; in the 1903 the spark is in the combustion chamber. Is it possible that the jet of ignited gas from this small chamber into the combustion chamber gives a better pressure than ignition from the ordinary position?

Before getting an old type plug bush we would like to know whether any of your readers have had a similar experience.—Yours truly,

W. R. ETCHES.

[We do not think that the difference of power in favour of the earlier model is to be accounted for by the reason suggested by our correspondent. Position of sparking plugs is of importance, but in both the cases in question they are situated in the middle of the crown. The plugs of the 1902 model might be expected to keep cleaner, but theoretically any difference in power should favour the 1903 type. The only satisfactory way of proving whether the 1902 engine really gives more

power than the other is to take a brake test of 10th, and this can be accomplished without removing the engines from the chassis. There are several factors to be taken into account besides the sparking—compression, carburation, timing of valves, friction of piston rings, &c. Again, the ratio of the gearing to the road wheels may be different, so that

The Electrical Motor Hearse which has recently been put in service in Berlin.

a proper comparison is rendered more difficult. Perhaps the 1903 model is geared higher, speed for speed, than the other.]

THE LIFE OF TYRES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Ignoramus," re 750 by 85 tyres, I bought a set of extra fort; they have run the car 1,500, and I think they are quite equal to another 1,500 miles. My car weighs 12 cwt. If the writer does not slow down over $1\frac{1}{2}$ in. granites, the tyres would probably cut badly and require some of the usual stopping in the cuts, but how the tyres can have worn out in six weeks I cannot understand, unless he drives at top speed and pulls up in a "stylish" way, by the back brakes, or starts at high speed with a fierce clutch.

I should send the covers to the makers and ask their opinion.—Yours truly,

R. HANNEN.

WIRE OR WOOD WHEELS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. Edge, in a letter in your Correspondence column, states that he believes "that the straight forward and usual artillery wheel is the best form of wood wheel." He asks for tests of staggered wheels as compared with wire wheels and artillery wheels of the same weight. It hardly requires a test to prove that the staggered spoke wheel is stronger, but only to see how much stronger. Before adopting staggered spoke wheels as standard for our cars, we had exhaustive tests to compare them with the artillery wheels which we formerly used, for we also consider that nothing but the best is good enough for the Argyll. Three 815 mm. by 105 mm. wheels of the artillery type were compared with three staggered wheels of the same size. The strength of the spokes between the felloes was identical in all the wheels. Average weight of the three ordinary wheels was 33.14 lbs., as against 35.36 lbs. for the staggered wheel. The difference in weight arises from the fact that the staggered spokes have a broader hub, and this difference of weight was exactly equal to the extra wood and extra length of hub required for the staggered wheel. The average breaking strain of the ordinary wheels was 3,020 lbs., and on the same basis the staggered wheel should have been broken at 3,222 lbs., if they were only as strong in proportion to their weight as the artillery wheel, but they actually stood an average of 3,917 lbs., which shows them to be, weight for weight, 20 per cent. stronger than the artillery wheel.

This test was taken by Messrs. Kirkcaldy and Sons, of London, and the figures quoted are from their official report. Even better results than these have been got, but we prefer to use the figures as verified by Messrs. Kirkcaldy. The strength, to resist side strains, of the wire wheel which Mr. Edge prefers is entirely due to the staggering of the

tension spokes, and if Mr. Edge gets a wire wheel with straight spokes, he has a comparison somewhat analogous in principle to the staggered and ordinary artillery wood wheel. A good deal can be said for the wire wheel, but unfortunately it has a decidedly cheap and nasty appearance when fitted to a well-appointed car.—Yours truly,

ARGYLL MOTORS, LTD.

AUTOMATIC CHANGE-SPEED GEAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It would seem that one of the pleasing mechanical possibilities to which the motor-car transmission lends itself is automatic speed changing transmission, in which the ratio of reduction from the engine to the rear road wheels is regulated entirely without the supervision of the driver. Next to the gearless car, such as the Direct, which made its appearance two or three years ago but of which nothing has since been heard, this is the ideal thing in transmission mechanism, and were its achievement perfectly feasible without introducing too much additional complication, its general adoption might be speedily looked for. As it is, however, and notwithstanding the appearance of one or two automatic devices, motorists are still compelled to use the change-gear lever, while dreaming of the time when their entire efforts will be confined to the simple operations of steering and controlling the motor. Judging from the arrangements that have so far been designed, it would seem questionable whether it is advantageous to replace a number of simple operations for one or two of the greater complexity necessary to accomplish the same net results. Continued refinement may serve to eliminate or combine the elements in such a way as to make possible the achievement of such mechanism with a small number of parts. For the present, however, the average motorist is fairly well satisfied with the simplest possible amount of mechanism, even though its use entails a little more labour.—Yours truly,

COLONIAL.

STARTING HANDLE LOST.—While motoring from London to Worthing on the 26th ult., Mr. J. Arthur Formoy, of Chestham, Sutton, Surrey, shed the starting handle of his Brush car. He will be pleased to reward the finder who returns it to him.

THE FLEXIBILITY TRIAL.—Mr. Colin Defries has sent us a copy of a letter he has addressed to the Secretary of the Crystal Palace Automobile Club, in which he mentions that his Porthos car withdrew from the competition in consequence of his mechanic falling off the car, which went over his foot, while ascending a hill, with the result that it was impossible again to start on top speed. He also

The Motor Coach which Fiat Motors, Ltd., intend to run during the coming Summer between London and Brighton, at Crawley.

The vehicle, as will be seen, differs from the ordinary motor-bus, inasmuch as there is no upper deck, and the engine, being a 24-h.p. Fiat, is capable of propelling the carriage with from twelve to fifteen people on board at a considerable speed.

points out that he stopped his car long before it had entered the test zone, so that as he did not cover the course or even barely begin it, it was a matter of absolute impossibility to record any speed whatever.

CLUBS AND ASSOCIATIONS.

THE JUNIOR AUTOMOBILE CLUB.

THE officers of the executive of the Junior Automobile Club organised a run to Baldock on Good Friday, and twenty-four members and friends lunched at the Rose and Crown. The season proper of the club will open with a week-end run to Brighton on the 13th inst., and prospective members, who would like to be present on this occasion, are invited to write to the hon. secretary, Mr. S. C. Darrington, "Oakthorpe," Brownlow Road, New Southgate, N.

In order to keep the amateur element preponderating, in accordance with one of the original ideas that prompted the formation of the Junior Automobile Club, a resolution has been passed by the committee to the effect that no more members of the motor industry shall be elected for the next six months, this motion only to be rescinded by a full committee meeting.

RICHMOND AND DISTRICT M.C.C.

THE first annual general meeting of the Richmond and District Motor Cycle Club was held at 18, Down Street, Piccadilly, on the 22nd ult., Mr. F. Straight being in the chair. The Marquis de Mousilly St. Mars was elected president, and the vice-presidents for 1907 will be:—

The Long Distance Trial of the 40-h.p. Siddeley Car. A snapshot at Bettwa-y-Coed.

Messrs. F. Straight, Dr. W. M. Paul, E. M. P. Boileau, and Captain L'Estrange. The new committee consists of the following gentlemen:—Messrs. S. Bramley-Moore, F. C. Wood, J. H. Greenwood, L. B. Clare, A. P. L. Sladen, and L. Holman. A rule regarding the election of members was passed to the effect that members of the club who are engaged in the motor-cycle trade be not eligible to enter for competitions, the definition of a trade member to be settled in each individual case by the committee.

SCOTTISH A.C.

THE annual meeting of members of the Scottish A.C. was held at Edinburgh on Thursday, the 4th inst., when it was reported that the membership totalled 765. Reference was made to the many activities of the organisation during the past twelve months, all of which have been chronicled from time to time in our columns. We understand an effort will be made during the year to bring every Scottish motorist into the ranks of the club.

THE COMMERCIAL MOTOR USERS' ASSOCIATION.

THE members of the Motor Van, Wagon and Omnibus Users' Association, at their annual meeting held on the 26th ult., resolved that in future the association should be known as the Commercial Motor Users' Association. The annual report, which was adopted, shows, among other matters of interest, the work of the association done in connection with the Commercial Vehicle Trials, the registration of motor vehicles by the War Office, extraordinary traffic claims, and the periodical inspection of mechanical vehicles. In the course of the discussion reference was made

to the recommendations of the Royal Commission on Motor-cars, the Lights on Vehicles Bill, and the Metropolitan Water Board Scheme for the supply of water for motor vehicles. The association includes in its membership and upon its committee representatives of the leading railway companies, omnibus companies, breweries, &c.

MOTOR YACHT CLUB.

THERE is every prospect of the British International Cup Race of 1907 proving extremely interesting, for in all probability the American challenger "Dixie" will bring a companion with her.

The estimates for the boats and engines for the one-design class of motor-boats show clearly that a most useful boat can be built for a little over £150.

A meeting of the Joint Committee of the Motor Yacht Club and the Society of Motor Manufacturers and Traders took place recently for the final consideration of the rules for the 1907 Reliability Trials. The chief point under discussion was the rule to determine the marks due to vessels under the score of economy of fuel, last year's rule having been found unsatisfactory, and a solution of the difficulty was finally obtained. It was also decided that grounds upon which marks had been deducted from a boat should be communicated to the competitor for his private information. An important addition was made in a rule which debars boats that do not start within ten minutes in the case of those using petrol for starting, and twenty-five minutes in the case of boats starting on paraffin, from being eligible for a non-stop certificate.

THE Liverpool Motor Club had an Easter tour to the Lake District, making Keswick the centre of their excursions.

THE annual meeting of the Berkshire A.C. will be held at the Great Western Railway Hotel, Reading, on the 20th inst.

JUNE 29th has been provisionally fixed as the date for the annual Birdlip Hill climb of the Bristol and Gloucestershire A.C.

THE new handbook of the North London Automobile Club is a very interesting booklet containing much general information as well as the diary of club events and list of club members. Mr. J. Thomas Barber, the new hon. secretary, is to be congratulated on its appearance.

THE opening run of the Notts A.C. for the 1907 season will be held on the 13th inst., to Ye Olde Bell, Barnby Moor.

ON the 27th inst. the Harrogate A.C. will hold an inter-club meet with the Yorkshire A.C. at the Crown Hotel, Boroughbridge.

ROAD REPORTS.

DEVON.—Motorists in the neighbourhood of Dartmouth have lately found a dangerous piece of road between Paignton and Kingswear. Water mains on this road have been laid from near Churston Station, and it has been almost impossible to drive thence to the top of the hill leading down to Kingswear. As to avoiding this bad piece, Mr. F. C. Hunter, of Exmouth, advises motorists to keep to the left at the fork after passing the station mentioned (just beyond the golf course) and to go through Brixham. This is only a few miles round. Returning from Dartmouth, they should, when at the top of the hill above Kingswear keep to the right on the Brixham road.

DERRYSIRE.—The Baslow road is in a very bad state owing to the quantity of loose stone which has been recently laid and not rolled in. The Committee of the Sheffield A.C. have instructed their secretary to take the matter up with the responsible authorities.

ISLE OF MAN.—The Royal A.C. has voted £200 to the Highway Board of the Isle of Man.

CROMER.—Motorists who have visited Cromer during the holidays report that the roads were in splendid condition.

GODALMING.—On the suggestion of the Highways Committee of the Godalming Town Council some roads in the town are to be tar-coated and others to be treated with calcium chloride, with a view to the testing of the merits of the two systems. The latter plan will be tried on thoroughfares with steep inclines, as the tarring might become slippery and involve a strain on horses. The cost of the two methods as adopted by the local surveyor is practically the same.

MR. G. H. JACK, who has been appointed County Surveyor of Herefordshire, has read a paper on "A Retrospective View of Roads and Road Making" to a meeting of the Midland Association of Local Government Officers. Referring to the future of our main heavily trafficked thoroughfares, Mr. Jack said that if they are to remain under macadam, much more money than hitherto must be spent on maintenance, and many must be entirely reconstructed to provide the required stable foundation. In view of that and of the comparatively short life of the very best macadam road, it might not be altogether out of the question to suggest that the road of the future may be a reversion in essential particulars to the Roman road—a hard, coherent, scientifically-formed foundation, covered by a compact, watertight pavement. Such a road would meet the demands of all sorts and conditions of traffic, afford easy traction, be comparatively dustless and mudless, and easily cleansed and kept in repair.

DUST NUISANCE AT KINGSTON-BY-SEA.—The annual Kingston-by-Sea parish meeting took place last week. During general business several ratepayers expressed the opinion that the dust nuisance along the main road was an intolerable one, and a strongly-worded resolution was passed to be sent to the District Council to forward to the County Council, with a view to steps being taken to abate the same.

The Cordingley Show.

TO-DAY (Saturday), at the Agricultural Hall, London, the Twelfth International Motor Car Show organised by Messrs. Cordingley and Company will begin, and will continue to attract the attention of the motoring world throughout the whole of next week. Many important novelties, such as the eight-cylinder engine for the Weigel car for the Grand Prix race, the new six-cylinder Florentia and S.P.A. cars, many important new British vehicles, and other features of an important motor-car exhibition are on view, full reports of which will appear in subsequent issues of the *M.C.J.* Meanwhile the following notes on some of the exhibits will prepare the way for the more exhaustive report next week.

The Wallis Steam Wagon.

Messrs. WALLIS AND STEEVENS, LTD., of Basingstoke, exhibit a standard 5-ton tractor and a 5-ton steam wagon. The Wallis tractor has become such an everyday feature of road traffic as hardly to require description, but the firm have steadily improved their machine with such great experience to guide them, and the exhibition tractor represents the last word on the subject. The engine is of the compound type with link motion operating slide valves on the outside of each cylinder so that the steam chests are readily accessible. The whole of the motion is enclosed, together with the change-speed gear. The 5-ton steam wagon, of which we give an illustration in Fig. 1, is described by the makers as their standard tractor put between shafts. The boiler, engine, and

Fig. 1.—The Wallis and Stevens Steam Wagon.

countershaft, together with the front axle and steering gear, is practically identical with that on the tractor. The channel frames of the wagon are riveted to plates secured to the fire-box shell plates, and are continued to the smoke-box, where they fit into brackets, but are not fastened rigidly to the latter, so that the boiler is free to expand independently of the channels. The drive is transmitted from the second-motion shaft by a Renold roller chain to the differential on the five back axle.

The Burrell Steam Tractor.

Messrs. CHARLES BURRELL AND SONS, LTD., exhibit a steam tractor which in general design follows the lines of the Burrell traction engines. The locomotive boiler, with single cylinder or compound engine, is mounted on the boiler barrel, the motion work being over the top of the fire-box. The fast and slow pinions on the end of the crank shaft drive direct on to the differential, and the two road wheels are driven independently, by separate pinions, on either end of the differential countershaft, driving spur wheels secured to each road wheel. This makes a much easier drive, and also lends itself to the introduction of a device for instantly locking the differential gear from the foot-plate, directly one wheel begins to slip. The steering gear is also special to the Burrell engines, as, instead of the worm shaft and chains, a positive gear is introduced. A special fly-wheel brake, operated by a wheel and screw from the foot-plate, provides an extra control over the engine. Large water tanks are provided, slung under the boiler barrel, and a winding drum is carried between the spur wheel and road wheel, on the left side of the engine.

The Magnoid Process for Repairing Castings.

Considerable interest will be shown in the exhibit of the MAGNOID COMPANY, LTD., who have acquired the rights in a new French process for the repair of castings of iron, steel, aluminium, and bronze alloys.

Various methods have at one time or another been employed to fuse together aluminium or cast iron; but these were not wholly successful, owing to the fact that shrinkage and warping of the castings, uncertainty of the weld and hardness of the joint were unavoidable. The various samples of repair work on view afford conclusive evidence of the value of the process, by means of which castings that have from one cause or another been damaged can be made perfect at considerably

Fig. 2.—A Comparatively Simple Form of Fracture at the Base of a Cylinder before repair. The broken lugs are also shown.

less cost than an entirely new part. The process must not be confounded with soldering, as in carrying out a repair a metal of the same composition as the casting is melted into the space that has to be filled up, and which can afterwards be machined. The accompanying illustrations show a comparatively simple form of fracture at the base of a cylinder, three lugs having been broken off. Much more difficult work than this can be undertaken, the Magnoid Company having sent us illustrations of the upper half of an engine base chamber with one of the supporting arms broken, of a cracked cylinder and gear wheels with broken teeth, all of which have been successfully mended. As to the strength of the repair, we have seen a cast iron

Fig. 3.—The Cylinder as Repaired by the Magnoid Company.

test piece which was first cut apart exactly in the middle. The two parts were then joined together by the Magnoid process, and, after being machined to a suitable section in the lathe, the whole was subjected to a tensile test, applied by means of chains through eyes in ends of the specimen. Instead of breaking at the point where the repair had been effected, a fracture occurred at a tensile stress of six tons, but not at the join.

The Humid Six-Cylinder Car.

Among the six-cylinder cars on view is the Humid, made by Messrs. HURST AND MIDDLETON, LTD., of Windsor Road, Holloway, N., which is noteworthy on account of the relatively low price at which it is offered. We gave an illustrated description of the vehicle in the M.C.J. of September 29th last, but it may be briefly mentioned that it follows the general design of live-axle cars. The 40-h.p. motor, which is built throughout by the firm, comprises six separately cast cylinders, the dimensions being 4 in. bore by 4½ in. stroke, and the normal speed 1,000 revolutions per minute. The valves are mechanically operated off separate cam shafts, the inlets being arranged on one side and the exhausts on the other. A separate exhaust pipe is provided for each cylinder, the burnt gases first passing into an expanding chamber, and thence to the silencer proper. The water circulation is maintained by a gear-driven pump and a framed tubular radiator of the firm's own construction, an air-inducing fan also being fitted. No governor is provided, the speed of the engine being controlled by the throttle and ignition levers fixed above the steering wheel. The pedal operating the clutch is, however, so connected up that as the latter is withdrawn the motor is automatically throttled down. To the gear-box the power is transmitted through a wide leather-faced clutch fitted with springs to allow the load to be taken up without jerks. Three speeds forward and reverse are controlled by a single lever, the drive on the top being direct. From the gear-box the power is conveyed through a cardan-shaft and bevel gear to a live axle which has only the driving strain to withstand, the weight of the car being carried by the sleeve surrounding the axle. Any form of carriage body can be fitted to the chassis, which has a wheel base of 10 ft. 3 in.

Lubricating Oils.

The STERN-SONNEBORN OIL COMPANY have their usual display of high grade lubricants for motor-cars, &c., and a collection of specialties recently introduced for various purposes in connection with the running

A minor vexation almost inseparable from motoring is the clinging nature of the grime and dirt that lingers on the hands of the practical motorist. Several preparations have been introduced to alleviate this disagreeable feature, and that shown by the SANITAS COMPANY has won distinction among such goods. This is an "Automobile Soap" of pure degree that has the further recommendation of being a fragrant soap of disinfectant properties acting instantaneously and not hurting even the tenderest skin. This and a metal polish constitute the exhibits of a new comer in the accessory section of the Show.

Fluxite.

The registered "Fluxite" soldering paste is shown by the AUTO-CONTROLLER AND SWITCH COMPANY, who claim that it is effective, clean, and handy, while there is no mess or waste in its use. With this flux practically any metal can be soldered or tinned without being first prepared or cleaned. Being in the form of a stiff paste, it will adhere to the object to be soldered; it can also be carried with safety in the tool bag. An important quality of Fluxite is that it can be employed on cast iron, steel, lead, zinc, &c., where neither spirits nor resin is suitable. The solder will "run" with great ease and adheres perfectly on practically any metal when this paste is used as the flux. It has the advantage of not affecting the insulation of electrical machines and apparatus, and should be found in all motor-car works and repair shops.

(To be continued.)

THE FLEXIBILITY TRIAL.

WITH reference to the Flexibility Trial of the Crystal Palace A.C. we are asked to mention that the Committee tender their thanks to Col. Holden for his very kind offices in connection with the formula. Nearly all the cars did most remarkably good performances—in fact, considering the difficulties of the London to Bexhill road, it would hardly have been

Car No. 8. Engine stop marks. This car was delayed 56 minutes in all, but could not lose more than the full 200 marks.
Car No. 13. Ditto (lost 23 minutes).

of vehicles. They show samples of Clutcholine, which, as its name implies, has been prepared for use on metal or leather clutches, improving the grip and securing the general good behaviour of the device. It is a pure non-corrosive lubricant of tried merit. A newer introduction to the motorist is Cooloricid—a preparation for cooling the hot bearings, brakes and clutches of cars. The company have their comprehensive range of Sternal Huile, Motosternal, Autosternal, gear oil, &c., as well as their elastic Sternaline chain paste, which forms a hard yet elastic surface, simultaneously acting as a lubricant and reducing noise.

The Transport of Cars.

Messrs. HENRY JOHNSON AND SONS call attention to their facilities for the packing and transportation of automobiles of every description by means of the model of a crate. This firm has always recognised the importance of the import and export trade in motor-cars, and, having specialised on this class of business, possesses unique knowledge with regard to boat and rail services, and are able to economise time and money in the interest of those who place the shipment of vehicles in their hands.

Office Requirements.

Now that the card system has become recognised as almost an indispensable part of modern business methods, special interest is given to the stand whereon the SHANNON, LTD., demonstrate the applicability of their method of filing to the particular requirements of the motor-car trade—either in the garage or the office. The Shannon filing cabinets for recording and classifying information relating to cars and parts as well as to individual customers are likely to attract considerable notice from those anxious to facilitate business and ease the strain of modern business life.

thought possible by the average motorist that so many cars could have completed this distance with so few changes of speed, and at the same time do such high speeds on the Bexhill track.

The honours of the day fell to the six-cylinder Napier, but a good deal can be said for the six-cylinder Ford, which performed excellently, and it was unfortunate that at River Hill, owing to its having to fill up with water at Tonbridge, due to a leaky radiator, it did not do itself quite full justice. Mr. Colin Defries' Porthos was looked upon at one time as a very likely winner, but an accident which resulted in his running over his mechanic and then his engine stopping in the slow speed test put him out of the competition. The 14-h.p. Vulcan running in the second division was a well-deserved success. The very clean record of the Mass car should also be noted, only having one change of speed throughout the whole journey. The Reo also showed up well in the test, it being the lowest powered car in the competition. The 24-h.p. Courier was prominent on the fast speed test as a likely winner, its top speed being excellent, but on the slow speed test not doing quite as well as was expected.

POLICE TRAPS.

THERE is a police trap at Henley-on-Thames worked by officers concealed in a garden at the town end of the Fair Mile on the right-hand side of the town going towards Oxford.

AT Ashington, about ten miles from Worthing on the London-Worthing road, a police trap has been established.

THE police trap in Loampit Vale, Lewisham, has been in active operation again.

AERONAUTICS.

LORD AND LADY LLANGATTOCK had an Easter balloon party at their place in Monmouthshire, and were among the passengers in the Hon. Mrs. Assheton Harbord's "Nebula." After several captive ascents it made a free journey, travelling in the direction of Herefordshire.

MR. W. MANSERGH VARLEY has translated and Messrs. Whittaker and Co. have published Major H. W. L. Moedebeck's "Pocket Book of Aeronautics." This presents an authoritative summary of the state of the science at the present day.

THE annual general meeting of the Aero Club was held on Wednesday, the 20th ult., at 166, Piccadilly. It has just issued its official notices for the year, from which we learn that club ascents will be made on several occasions from the Crystal Palace during the year, and the "Harbord" cup race will be held at Ranelagh on May 25th, that for the "Hedges Butler" challenge cup taking place on June 29th. The first ascent of the year will be held from the Crystal Palace on the Thursday following the close of the Aero Club's Exhibition in connection with Cordingley's Motor Show next week.

MAJOR B. F. S. BADEN-POWELL, addressing the members of the Royal Meteorological Society recently on "The Exploration of the Air," said that the atmosphere was a vast and little-explored ocean. We crawled about the ground like crabs on the bottom of the sea, and made our meteorological observations down on the ground, ignorant of all that was going on in the midst of that great expanse of air. There were three means now at the service of man by which he might ascend into those desirable regions or may send up self-recording instruments to probe the mysteries of the skies, viz., balloons, kites, and flying machines. Although the balloon at the time of its invention was hailed with acclamation, as promising the conquest of the air, it was now realised that this cumbersome and delicate apparatus was not capable of much practical application. Meteorological kites had also been much improved in recent years, and instruments lifted by kites retained by steel wires had actually ascended to a height of four miles, while at Aldershot kites had been regularly introduced into the service. Men were first lifted by this means in 1895, in which year the lecturer himself made a number of ascents up to 100 feet high, but improvements have gradually followed until now men have actually gone up to a height of 3,000 feet, an elevation practically beyond the reach of rifle bullets and so high as to render the aeronaut almost invisible. Major Baden-Powell concluded by saying that the flying machine has come to stay. Years ago people argued that it was impossible to lift in the air that which was far heavier than the air, but the advocates of the cause pointed to the birds, and there was no gainsaying that the thing was possible. Then pessimists cried that it would not be possible to balance the apparatus without the intelligence of a bird, but models were made, finally so good as to fly three-quarters of a mile, and men also took to gliding on wings and sailing on the wind. Huge machines were constructed with very light engines, and during the last two or three years not only had men been successfully raised off the ground, but they had been able to sustain themselves in the air for half-an-hour at a time. Very little remained to be done before it could be said that man had veritably conquered the air.

COURTESIES OF THE ROAD.

THE Scottish Automobile Club, with a view to engendering good feeling on the part of the public to motor-cars and motor-cycles, recommend all drivers of automobiles, whether amateur or professional, to be especially careful on the following points:—

Passing cyclists and horse-drawn vehicles.—Give the maximum space possible.

Passing restive horses.—Use the utmost consideration, even to stopping the engine, if necessary, although no hand may have been held up. On narrow parts of roads, cross roads, corners, and bridges, drive slowly and with caution, and before passing from behind wait until a suitable part of the road is reached.

Passing through towns and villages and at roadside residences.—Go slowly, so as not to fill houses and cottages and cover gardens with dust, or throw mud about, and also for the safety of the inhabitants and their animals, &c.

Passing pedestrians.—Take care not to splash them with mud, or over them with dust.

Show caution and consideration always.

THE DANGERS OF THE HORSE.

SIR JOHN E. DORINGTON, chairman of the Gloucestershire County Council and formerly M.P. for the Tewkesbury Division of the county, had a miraculous escape whilst being driven in his motor-car in the Toadsmoor Valley on Good Friday. Whilst the car was travelling along a very narrow road, a runaway team of cart horses attached to a trolley laden with timber was seen emerging round a corner 150 yards away. There was no driver with the horses, which were galloping as hard as they could, and as there was barely sufficient room for two vehicles to pass considerable alarm was felt by the occupants of the motor. With great presence of mind the chauffeur ran the motor-car against a

wall by the side of the road, and urged Sir John to leave the car and jump over the wall. This Sir John did, and when the chauffeur followed his example the leader in the team of runaways was level with the car. The horses galloped past the deserted car, which escaped with some scratches. All danger being apparently over, Sir John Dorington and his chauffeur returned to the car, but had barely got back into the road when the horses were seen returning in the same manner. It seems that further down the road, where it was wider, a man had shouted at the runaways, which in a remarkable way turned round without upsetting the trolley. The shouting of Sir John Dorington and the chauffeur this time stopped the animals in their wild career.

MACHINE TOOLS FOR MOTOR-CAR BUILDERS.

WE illustrate herewith the Motor Cam Profile Milling Machine which has recently been introduced by Messrs. Webster and Bennett, Ltd., Atlas Works, Coventry, and which is finding its way into the shops of all motor manufacturers who desire every detail of their engines to be as perfect as possible. It is, of course, quite a special machine and is designed solely for the motor engineer.

The cam-shaft is turned before entering this machine, the cams leaving the lathe in the form of circular discs on the shaft. These are accurately milled to the outline determined in the drawing office, this being governed by a large copy which slowly revolves with the cam-shaft while the milling cutter does its work. As the cams are all milled from the same copy, it follows that they are exactly alike. When two or three outlines are required on one shaft a double or treble copy is arranged accordingly and the copy roller shifted from one to the other as the job progresses. The angle of the cams to each other is determined by a division plate. This important factor is made certain by the use

of cams solid on the shaft, and what is more, the angle cannot vary, as is too often the case when loose cams are pegged on the shaft.

A companion machine to the above in one which is designed on similar lines for grinding the cams after the shaft is hardened. An emery wheel takes the place of the milling cutter. In most other respects the two machines are alike in appearance and action. The product of the grinder has, of course, the highest obtainable finish and gives the greatest smoothness in working together with good wearing qualities.

PUBLIC MOTOR SERVICES.

THE proposal recently made by Mr. Holden to the Watch Committee of the Brighton Town Council to transfer ten char-a-bancs and twenty cab licences to motor vehicles was accompanied by the promise of the licensee that he would teach the horse drivers to drive the motor vehicles.

THE drivers employed by the General Motor Cab Company are now being examined by the Royal A.C. prior to their passing the usual police test at New Scotland Yard. Several drivers holding the Club's certificate have been supplied to the above company during the past week.

GREAT improvements have taken place in the motor-bus service at Eastbourne. Four new vehicles were put into public employment just before the opening of the holidays, during which they were well patronised.

DURING the holidays Messrs. Woodyatt arranged an attractive programme of motor-car tours from Malvern, including a trip to Broadway, a quaint old-world village on the western face of the North Cotswolds. On Easter Monday their cars ran to Goodrich Castle and Symond's Yat; Tuesday, Powick and Tewkesbury; Thursday, Witley and Martley; and Friday, Bosbury, Ledbury, Eastnor, and the Raggedstone Pass.

A MOTOR-BUS service has been inaugurated between Newcastle-on-Tyne and Marsden.

CASES UNDER THE MOTOR CAR ACT.

UNLICENSED DRIVER.

Thomas Marlowe, of Champion Hill, has been summoned by the police for driving a motor-car at East Dulwich Grove, he not being licensed for that purpose. Mr. Robert Humphreys, appearing for the defence, said the circumstances were these: Mr. Marlowe was about to purchase a car and on the 11th ult. he went out in a car in charge of an experienced chauffeur. The defendant wanted to see how the thing worked and took the wheel. He had not driven quite a mile when the officer came up and found he had no licence. A little episode which occurred during the run convinced the defendant that he was not a born chauffeur. He had no intention of driving again, but intended to leave the driving in more experienced hands. Mr. Hopkins.—Was any damage done?—Yes, sir, to a brewer's dray, but Mr. Marlowe has made that good. Mr. Hopkins fined the defendant 20s. and 2s. costs.

EXCEEDING THE LEGAL LIMIT.

Harold E. Dew, of Battersea, was fined £5 and costs, at Greenwich, on Saturday, for driving a motor-car at thirty-three miles an hour in Loampit Vale, Lewisham. He said an electric tramcar stopped suddenly in the "trap," and he put on a spur to pass it before it started again, but his speed just before was only eighteen miles. Alexander Maurice David de Groot, of Blackheath, was fined £3 and costs for driving a car at twenty-seven miles an hour in Shooters Hill Road; and Charles Gardner, of Whalley Range, Manchester, was similarly fined for a speed of thirty miles an hour.

COMPANY NEWS.

MEETINGS.

WEBLEY AND SCOTT, LTD.—Presiding at the annual meeting of Wobley and Scott, Ltd., on the 26th ult., the chairman, Mr. G. B. Winn, said that within the next fortnight they would have a motor-car on the road.

CHARRON, LTD.—The statutory meeting of Charron, Ltd., was held at the office of the company, 32, Old Jewry, London, E.C., on the 25th ult. Mr. Davison Dalziel presided and said that they had accepted for 1907 orders amounting to no less than 762 chassis. Beyond this they had signed very advantageous contracts for Belgium, Holland, Luxemburg, Germany, Austria, Hungary, and the Balkan Peninsula. In order to give a comparison of the results obtained during the first two months of the present year and the first two months of the preceding year, he said that, whereas in 1906, during the month of January, they turned out eleven chassis, and in February they turned out twenty-two, in January, 1907, the production was thirty-six chassis, and in February forty-two. The turnover of the business for January, 1906, was 236,000f., and for February, 1906, 594,000f., or a total of 830,000f. for the two months, whereas in January, 1907, the turnover was 576,000f., and in February 1907, 700,000f., making a total of 1,276,000f. The directors were extremely satisfied with the condition of the business, and were very sanguine indeed as to its future prospects.

NEW COMPANIES.

FIPPARD HYDRAULIC CLUTCH.—£5,000. To acquire the invention and patents of Mr. A. J. Fippard for improvements in hydraulic clutches for motor vehicles and other purposes. No initial public issue. First directors, Messrs. R. H. Measures (chairman), H. A. F. Measures, G. E. A. Measures, A. J. Fippard, H. C. Walker, and H. T. Wright. R. H. Measures may retain office while holding 1,000 preference shares, or half number issued for time being, with power to appoint two other directors, said H. A. F. Measures and G. E. A. Measures being first nominees. Qualification (except other first directors), 200 shares. As fixed by company.

COVENTRY CHAIN COMPANY.—£100,000. To acquire the business of the Coventry Chain Company, Limited, to adopt an agreement with the said old company, and to carry on the business of manufacturers of and dealers in chains of all kinds for motor-cars, &c. First directors to be appointed by signatories.

PADDON AND SOPWITH.—£5,000 (4,800 ordinary and 200 "B" shares of £1 each). To acquire the business carried on at 1, Albemarle Street, W., as Paddon and Sopwith, and to carry on the business of dealers in motor-cars, &c. No initial public issue. First directors, Messrs. P. W. Paddon, T. O. M. Sopwith, and H. V. Hermon. 1, Albemarle Street, W.

MOTOR-CAR ACCIDENTS.

MR. LIONEL NATHAN ROTHSCHILD has been lying at the Queen's Hotel, Birmingham, suffering from injuries sustained in a collision whilst motoring in the neighbourhood of Birmingham on Thursday of last week. Mr. Rothschild, who was driving the car himself, was unable to avoid a milk float at an awkward corner, and the collision caused him to be thrown against the head of the horse drawing the float. His injuries chiefly consist of superficial wounds caused by the goggles he was wearing. His sight is fortunately unimpaired.

A MOTOR-CAR has been partially wrecked and two cyclists seriously injured in an accident which occurred on the Buxton road near Stockport. The car, driven by a chauffeur and owned by Mr. J. H. Stansfield, Rawtenstall, was going towards Hazel Grove. To get past a tram-car and a number of cyclists it was turned to the off-side of the road. The tram prevented the chauffeur seeing two cyclists who were approaching from the opposite direction, and when he got from behind

the tram he was so close upon them that in order, if possible, to avoid a collision he ran the motor on to the footpath. But this did not prevent the smash. Both the cyclists were knocked down. They were subsequently taken to Stockport Infirmary, where it was found they had sustained serious injuries.

At a late hour on Saturday night Alfred Sexton was crossing the Kennington Road at the end of Brook Street when he was knocked down by one of the new motor-cabs. He was taken to St. Thomas's Hospital, where he died a few hours later.

In trying to avoid a wagonette at Rottingdean, near Brighton, on Easter Monday, the chauffeur of a motor-car in which were seated Mr. Cecil Edge and the Misses Catherine and Aileen Hennessey, collided with another car occupied by an Eastbourne doctor and a friend. Miss Eileen Hennessey was thrown out of the car, and upon being assisted to a neighbouring hotel was found to be seriously hurt about the head. The other occupants escaped without injury. The front part of Mr. Edge's car was smashed.

The inquest on the body of Charles Jackson, of Greenhills, Middleton Junction, near Manchester, who was killed in the motor accident on Blackpool Road on Sunday afternoon, has been held at Kirkham. After evidence of identification had been given, John Howarth, living at Middleton, said he was the owner of the car. Jackson and he set out to Blackpool from Middleton, calling at Chorley. They proceeded all right through Kirkham, and turned round a sharp corner down an incline into Blackpool Road. The car was then travelling at fifteen miles an hour. He reduced the speed to nine miles, but they came on to another corner before he knew where he was. When rounding this, the speed having previously been increased to fifteen miles, the hind wheels of the car skidded on the embankment, and the car turned turtle, pinning both the witness and his friend underneath. The witness freed himself, but his friend was dead. The jury returned a verdict to this effect, adding riders recommending that danger signals be placed on either side of the turn, and that the County Council be asked to widen the road, because it was dangerous.

ALLEGED FRAUDULENT MOTOR SCHOOL.

THE case against W. Addison and R. Foulkes, reported in our last issue came again before the Brighton magistrates on the 27th ult. The defendants were charged with conspiring together, on or about the 29th October, 1906, and other subsequent dates, to obtain by false pretences the sum of £2 in money, and four postal orders for the payment of £1 2s. 6d., with intent to cheat and defraud Alfred William Young and others. There were four alternative charges preferred by the Sussex County Automobile Club against the prisoners for obtaining by false pretences £2 from Young, £1 10s. postal order from Proctor, on 27th November, a postal order for 5s. from Dunstan on 3rd December, and a postal order for 10s. from Frederick Peter Cecil Burman on 28th November. Earl Russell (instructed by Mr. C. W. Buckwell, on behalf of the Sussex County Automobile Association), appeared to prosecute, and said he proposed to drop the charge of conspiracy and prefer the other charges. After hearing the evidence the magistrates retired to consider their decision, and on their return the Chairman said Addison would be bound over in his own recognizances in the sum of £5, to come up for judgment if called upon. Foulkes would have to go to prison for six weeks in the second division on each of the two charges, the sentences to run concurrently.

BUSINESS NEWS.

THE export business of the Daimler Company is daily increasing, and large packing cases containing cars can constantly be seen leaving the works for the station.

THE Hon. Evelyn Hubbard has written to Messrs. Humber, Ltd., stating that his Coventry Humber car has now been running for about six months, and reports that it is a very quiet and comfortable car, and on a fair road can keep up an average of twenty miles per hour without difficulty so long as it is not over-laden.

THE recent fine weather has already influenced the motor trade in the number of orders which are being received. Amongst recent purchasers of Daimler cars are the Earl of Normanton, who has ordered a 28-h.p. Daimler chassis, Lord Mount Edgcumbe, who has purchased a 28-h.p. "Stoneleigh" Daimler, and Rear-Admiral Sir Chas. Graves-Sawle, who has ordered a 30-h.p. "Milverton" model Daimler.

To meet the wants of motorists, Gaulois Tyres, Ltd., kept their despatch department open on Easter Monday.

CAPTAIN MASUI, who has recently been touring India, has arranged with Messrs. Ashworth Taylor and Company, Chowringhee, Calcutta, to act as agents in Eastern India for the Germain cars, and with the Bombay Motor Car Company, Ltd., for Western India.

MESSRS. A. GAAL AND CO., 17, Hanover Square, London, W., have secured the British agency for the Westinghouse cars.

THE Victoria Carriage Works, Ltd., of Long Acre, W.C., have received the first of the 1907 models of the 16-24-h.p. Leon Bollee car, and are now in a position to give trial trips to demonstrate the flexibility of the engine and the remarkably quiet running of the car.

ARRANGEMENTS have now been concluded with the London and North-Western Railway Company whereby the Royal Automobile Club will stock passenger tickets for the convenience of its members and arrange for the transport of their cars on the company's services, including Ireland and the Isle of Man.

THE Motor-Car Journal.

VOL. IX.]

LONDON, SATURDAY, APRIL 13, 1907.

[No. 423.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

ALTHOUGH the Lights on Vehicles Bill has secured a smooth passage in Parliament thus far this session, all is not won. There are many agricultural districts that are exciting much local discontent against the proposal that vans and similar vehicles should carry lights, and M.P.'s representing rural constituencies are being inundated with protests against such suggestions. In view of this it is to be expected that the organisations of motorists will not relax the efforts already made to convince legislators that the dangers of evening and night travelling mainly arise from the slow moving vehicles. This is the experience of those who drive horses, and is by no means confined to motorists. The latter have to illuminate their vehicles at the rear; but the necessity certainly seems greatest in the case of those lumbering vehicles that are not seen in the darkness until any succeeding vehicle may be almost upon them. The objectors are urging that the presence of so many lamps about farm buildings will add to the risks already associated with such places. They also point to the habitual carelessness of farm hands, &c., in connection with wagons. Agreeing that such is the case the Lights on Vehicles Bill may be recommended as a piece of educational work in that respect; while the risks of lamps can easily be dismissed in view of the improvements that have taken place in this department of industry since the advent of the car.

Motor Bodies.

IN fact, the coming of the automobile has had its effect in many ways, and has not only caused makers of lamps to direct their efforts to secure better results in their productions, but other trades have been incited to more intelligent efforts. No one can visit a motor-car show without recognising the impetus that the mechanical carriage has given to the body-building industry. Until the modern motor movement began carriage builders had managed to run in a well-defined rut, and innovations were few. Standard lines had to be followed, and departures from the conventional were regarded with ill-favour by the trade, and often with contempt by the customers. But the new conditions brought out by the motor-car have altered that attitude, with the result that a comfort and convenience is being given to carriages hitherto unknown. An inspection of some of the vehicles now being exhibited at the Agricultural Hall reveals a luxury in the way of internal arrangements that the carriage builder of two decades ago would have scorned. New designs, finer outlines, and a general all-round development are recognised as necessary by British carriage builders determined to keep in the front rank so far as the international outlook is concerned.

Ferry and Bridge Tolls.

THE Motor Union is now engaged in investigating five cases in which it has been alleged that the tolls imposed are excessive. One is the Floating Bridge from Devonport to Tor Point, which is governed by a very ancient Act of Parliament; at present 2s. 6d. is charged for a car weighing under one ton, which covers the return journey if made on the same

day. Another is the Saltash Ferry, where the Saltash Corporation have increased the charge from 1s. 6d. to 2s. 6d. for cars carrying more than two persons. Complaints have also been received by the Union as to the charge of a shilling made for each time of crossing the bridge at Goring-on-Thames. The charge made for crossing that between Lymington and Beaulieu (Hants) is also considered to be excessive. The facilities for the transit of motor-cars when crossing from New Holland to Hull and *vice versa* are the subject of negotiations between the Union and the Great Central Railway.

Water by the Roadside.

ONE of the difficulties of users of steam wagons in the past has been that of obtaining a supply of water in the streets. Taking water from the troughs dedicated to horses has brought the drivers into conflict with local authorities, and it was with satisfaction that we were recently able to announce that the Metropolitan Water Board was preparing a scheme which should relieve users of such vehicles of anxiety. Necessarily any plan of such a nature would have to guarantee the ratepayers against preferential treatment being accorded to any particular section, and the proposals now made by the engineer to the Water Board deserve credit as an effort in that direction. The idea is to erect at central and convenient spots a series of penny-in-the-slot machines from which water may be taken for steam vehicles. No great delay need arise before these are placed in position.

The Exhaust Gases.

THE tests that have recently been carried out by the Royal A.C. in connection with the Vapour Emission Competition revealed the fact that some of the cars were emitting an excess of carbonic oxide gas, and now it is pointed out that in cases where cars give out more than 2 per cent. of this gas they are objectionable to the public. The Club is prepared to undertake the necessary test of any car that may be submitted to it, to take samples of the exhaust gases, and to report the results of the analysis. Carbonic oxide (represented by the formula CO) is the lower oxide of carbon. It is colourless and transparent, has an unpleasant odour, and is poisonous. It is slightly lighter than air, having a specific gravity of .968. The particularly obnoxious nature of this carbon oxide is well known. A feeling of discomfort and headache may be produced by inhaling it. When the engine is running and the carburettor is being adjusted, it is advisable that the doors of the motor garage should be open, so that plenty of fresh air should be admitted.

Scotch Law.

DOUBTLESS the Scottish Automobile Club will keep watch over the proceedings of the annual general meeting of the Convention of Royal Burghs, which has been held in Edinburgh. Here many of the authoritative persons from various parts of the northern kingdom have assembled to discuss matters of varying importance. Two debates have occurred in which motorists claim as much interest as other people. One had reference to the imposition of a new tax on all mechanically-

propelled vehicles; the other was concerned with the recent decision of the Court of Justiciary to the effect that magistrates in Scotland have no jurisdiction to try offences under the Motor Car Act. With regard to the former matter it was ultimately decided to delay a vote for a year—a wise proceeding with which all motorists will have agreement; and on the second point a resolution was adopted in favour of such offences being brought before the magistrates. The Assessor for Ayr, who introduced the motion, declared that as the magistrates had the regulation of the roads and had to get up the cases, it was but reasonable that they should try the matters. To our mind these are just the reasons which should confirm the view of the higher legal authorities, for it is always well to separate the dispensers of justice from those who have the power to set the machinery in motion.

A Steam Car at Flood Time.

If there were ever any motorphobes in the city of Alleghanny, Pennsylvania, U.S.A., they probably revised their ideas after the great flood which recently occurred there. Never were means of swift and sure transportation more needed than when the Alleghanny River commenced to overflow its banks and to inundate a part of the residential district.

Although warnings there had been in plenty that a flood was imminent, it was not until the water commenced to course through the streets that people thought of abandoning their homes and seeking shelter on higher ground. Then they found that the means of escape at hand were hopelessly insufficient. Those who had obtained possession of boats were charging a guinea a head to carry people to places of safety. Empty boxes, planks and all kinds of household furniture were pressed into service as rafts. In many instances these frail craft were swept out into the river, with the result that a score of lives were lost in this way in the vicinity of Pittsburg alone. Just at the moment when all was confusion Mr. H. I. Cashman, of Pittsburg, appeared on the scene with his White steam car. He had driven over to Alleghanny merely out of curiosity, but on arriving there he saw at a glance that he could use the car for service. Accordingly, he drove into the streets along the water front and carried load after load of people to places of safety. As the flood increased he retreated gradually from street to street and it was not until night fell that he ceased his hazardous work. His car suffered no harm from this amphibious service, and he gained not only the thanks of the authorities, but also the gratitude of the people.

Roads Again.

POSSIBLY some of our readers will have a feeling of alarm when they learn that a conference is to be held in London next week, when eight papers will be read, or taken as read, on the subject of Roads. Engineers' societies, ratepayers' associations, rural councils, motoring organisations, and, in fact, everybody talks of roads. Tests of materials, trials of dust-layers, learned disquisitions on Continental methods, and general advice as to how to improve matters are as frequent as changes in the weather; but the dust rises with the coming of the car, the cost of maintenance advances, and the grumbles become universal. Surely we have nearly come to the end of the talking period, and the time for practical demonstration is near at hand. Elsewhere we give the programme of the conference, from which it will be seen that three of the papers have the word "could" in their titles. The word "must" ought to be substituted; and then the National Dustless Roads Committee might get to business and justify itself. But with the multiplication of committees and the duplication of organisations dealing with the matter the roads will soon be strewn with as many impossible notions and lost hopes as would constitute a nuisance almost equal to the dust it is sought to allay. Sir John Wolfe Barry will take the chair at the forthcoming conference.

State Aid in the United States.

It is certainly a remarkable coincidence that almost contemporaneous with the holding of this conference the annual convention of the American Roadmakers' Association has been taking place at Pittsburg. There were 2,500 delegates, representing no fewer than thirty-eight States of the Union, and it was reported that 1,151 miles of road have been improved under the State Aid law, by which wide and sound roads are being encouraged. One of the speakers—State Road Commissioner E. C. Hutchinson—said that "State aid for road improvement has done more for our State (New Jersey) than any law ever placed upon the statute-books. It has increased the value of our farms, and has added not only to the pleasure and comfort of our farmers, but to that of the city men who have bought farms and built large country mansions along the line of our improved roads, thus increasing the rateable property by millions of dollars." We commend this to the notice of Mr. E. J. Lovegrove, who is to bring the question of State aid to the notice of next week's conference. The recognition of main road making and maintenance as a national matter must become a plank in the motorist's propaganda platform.

The Revival of the Toll Bar.

ALTHOUGH the Renard road train is not seen in the Agricultural Hall building, the public has shown a keen interest in this means of transit, and the vehicle has made many trips daily in the square to the rear of the Minor Hall—which, by the way, is to be utilised for the extension of that section of the building. On Monday evening the subject was considered by experts at a meeting of the Society of Engineers, when Messrs. B. H. Thwaite and R. F. Thorp read a paper on the system. The authors, having traced the evolution of the mechanical road transport system from its practical introduction in 1820-40, went on to say that the success of Stephenson's railways and the railway boom of the forties in their combined effect suppressed all interest in road motor coaches just as they did in the case of stage coaches. Since the passing of the Act of 1896 the expansion of the motor-propelled road transport vehicle in industry had been marvellous. Merely taking the application of the motor to the metropolitan buses, startling figures were obtainable. Unfortunately, the application of the motor to omnibus vehicles had been too hurried and too rapid, and but little real progress had resulted. The economics of transport work had not been properly studied and respect for the surface maintenance of our roadways had been considered to be a negligible quantity. Doubtless the

tendency of modern transport inventions to return to the road would be followed eventually by a revival of the toll-bar system, and it was very probable that the tolls would be proportionate to the wear and tear characteristics of any given mechanical road transport system. Indeed, that would only be fair. It would, in the opinion of Messrs. Thwaite and Thorp, indirectly provide a premium for the best designed vehicular system.

Taxation.

SUCH suggestions may sound strangely on our modern ears; but there is no doubt that the whole question of the cost of roads will shortly come up for revision, and motorists will have to be wary in declaring themselves with regard to the sources and the scope of taxation. On Thursday next, at the annual meeting of the Association of Municipal Corporations, a proposal will be laid before the delegates by the Legal Committee in favour of the additional taxation of motor-cars. Then, too, we have the usual crop of Budget rumours associating the automobile with the Chancellor of the Exchequer's raid upon the pockets of the people. To these latter, however, little credence is given by those who know how Mr. Asquith and several of

notice that the time for renovation has come. Otherwise the continued use of the cover may injure the outcrop of cord. Verily in this case "a stitch in time saves nine."

Protecting the Public.

WITHIN the past ten days the Motor Union has secured the conviction and punishment of two persons guilty of offences against users of the road. The first case was one of obstruction, the second of assault. The obstruction case was heard at Edgware Police Court, and resulted in a carter being fined 10s. and 7s. costs, or fourteen days' imprisonment. Earl Russell was driving his Daimler car between Finchley and Child's Hill, and had for a passenger Mr. Rees Jeffreys, Secretary of the Motor Union, when a carter held them up for ten to fifteen minutes by refusing to move his own vehicle and so allow the car to pass; he also declined to give his name and address. Fortunately a mounted patrol appeared on the scene and required him to give way, and the police subsequently took out a summons. Mr. Rees Jeffreys appeared as witness in support of the summons, with the result mentioned above.

M. C. Godard on the 40-h.p. Spyker Car he will drive in the Pekin-Paris Trial.

his colleagues have studied the automobile question from the practical as well as the theoretical aspect.

Care in Minor Matters.

PERHAPS in no pastime or business does the neglect of little things play such an important part in comfort and happiness as in motoring. And it is the small matters that are often ignored, with consequent loss and worry. To guard against a carelessness that seems fairly general several motor-car makers issue elaborate books of instruction, and the constructors of tyres are equally thoughtful. The demonstrations in cord tyre making at the Agricultural Hall may be regarded as part of the education of the "complete motorist"; and although visitors have been particularly struck with the cording arrangement, the subsequent process is also of importance. After cording a covering of rubber is applied and the beads attached. In the tread a strip of red rubber is inserted to act as a warning when the cover needs immediate repair. The wearing of the rubber of the tread to that point is a

These cases make the seventh successful prosecution for obstruction, and the sixth for assaults on motorists, obtained by the Union during the past nine months.

The Speed Limit at Ware.

THE inquiry held by the Local Government Board into the application for a speed limit of ten miles an hour through the streets of Ware does not seem to have resulted in any confirmation of the view taken by the Urban Council of the place and officially proclaimed through the County Council of Hertfordshire. The town is situated at the junction of several main roads—the main roads from London to Cambridge, from Hertford to Bishop Stortford, and from London through Ware to the Great North Road at Stevenage. There is an ever-increasing number of motor-cars passing through to get to the main roads beyond, and owing to the streets being extremely narrow and the local traffic being of such a peculiar nature, the applicants were emboldened to make the application. But the Superintendent of Police, who was called in support

of the application, gave very good reasons why it should be refused. There were, of course, isolated cases where motorists drove furiously, but, speaking generally, he agreed that motor-cars were driven through Ware at a reasonable pace, and that since warning notices had been put up the drivers had slackened down and generally driven carefully. The replies to several questions were exceedingly interesting, and the Inspector remarked that the Superintendent evidently preferred the present elastic power of dealing with anyone driving dangerously to the ten-mile Order wanted by the Urban Council—a view to which the witness assented. The witnesses against the application included the Rev. W. Errington, rector of Hunsden, the Rev. George Rowley, rector of East Wick, and Mr. P. A. Sharman, the hon. secretary of the North Herts A.C., and there appeared little doubt but that the application will be rejected.

The World on Wheels.

ALDERMAN IVEY gave an address the other evening, at a meeting of the West Ham Burgesses' Association, on "Roads and Rails," in the course of which he recalled some interesting information with reference to the world on wheels.

He mentioned that the first London omnibus was started in 1829, and ran from Marylebone Road to the Bank; local

A View of some of the Exhibits in the Aero Club Section of Cordingley's Show.

interest might have been excited by telling of the adventures of the motor-bus constructed in the locality by Hancock, and put into service between Stratford and Paddington in those pre-Victorian years. The first Metropolitan tramway was laid along the Whitechapel Road in 1872. Since then locomotion has completely changed its form, and even now finality has not been reached. The coming of the motor-bus has effected another change, to which Alderman Ivey only referred in order to dismiss it as an expensive method of conveyance as compared with the tramcar—a point of view that he may modify ere the close of the present decade.

The Show Catalogue.

THE fact that the Catalogue of Cordingley's Motor Show and Aero Club Display contains the names and addresses of more than 400 firms and persons interested in the motor-car and aeronautical developments of to-day lends

value as well as interest to that publication, which extends to nearly 200 pages, and constitutes a useful directory. It is published at sixpence, and will be sent post free for tenpence to any address in the United Kingdom on application to Messrs. Cordingley and Co., 27-33, Charing Cross Road, London, W.C.

THE AEROPLANE DISPLAY.

WHILE heavy vehicles and other terrestrial things have attracted attention on the ground floor of the Agricultural Hall, London, this week, men of flighty ideas have demonstrated their higher hopes in the Berners Hall and the extensive Arcade Gallery. Just as at one of the earlier Cordingley Shows the coming of the motor boat was foreshadowed in an artificial lake in the Gallery, so at the present exhibition we are offered a glimpse into one of the most interesting problems of locomotion in the future. Man has made conquest of land and sea, but the domain of air he has not yet won, as was pointed out by Mr. Bennet Burleigh in his article on the Aero Club Display in the "Daily Telegraph" on Monday. But, continued the famous War Correspondent, who was an interested visitor on the opening day, the Aero Club "has grafted upon the magnificent automobile show which was opened at the Agricultural Hall, Islington, on Saturday, an exhibition of apparatus designed to solve the whole problem of aerial navigation. The collection is fitly associated with a Motor Show which sets forth the latest development of the marvellous wheel, the origin of which, though lost in antiquity, has done so much for civilisation, and which has now been brought forward in conjunction with the newest and lightest of engines for developing power."

In the evenings the Berners Hall has presented something of the appearance of Hyde Park in the little groups of men who have eagerly discussed each other's inventions and criticised one another's ideas. The enthusiasm of some of these inventors of airships is infectious, and it was interesting to see a sceptical person, weighing eighteen stone, gradually converted to the belief that ere he was much older, and heavier, he would be able to journey home above the houses while motorists followed the devious roads planned by local authorities on *terra firma*. General opinion amongst those who have been prominent in these little gatherings has favoured the bird as the model of flight—a very natural as well as an ancient thing to do, for was it not in the days of Xenophon that Archytas invented a pigeon he hoped would fly. Now Mr. R. M. Balston and Mr. José Weiss have given us embodiments of their views of aerial navigation in the form of a bird of nondescript order and of the albatross respectively. Mr. Balston's model is the largest in the display, measuring 17 ft. from tip to tip. Major R. F. Moore, too, relies on the idea of the flight of birds, and has devised airships with flapping wings and a miniature electric motor. One of the most admired models is that of Mr. Ezio Tanio, who has a steel working model of an aeroplane; Major Baden-Powell has three; Mr. A. V. Roe shows no fewer than five models driven by propellers, and Mr. W. Gabell attracts notice with his mechanical kite to be driven by an acetylene engine weighing 1½ lbs. and measuring 7½ in. in length. Much attention is being given to the air glider shown by Mr. W. Cochrane, whose previous endeavours in connection with motor-boat propellers have been shown at other Cordingley exhibitions. His glider is not unlike a torpedo with propellers at each end and fitted with bird-like wings. This is constructed of aluminium and weighs only 4½ lbs. Mr. Cochrane is a believer in the wing action and shows corrugated aluminium wings modelled on the exact form of the feather in the wings of birds. These are attached on light canes, and when struck upwards or downwards through the air suggest an excellent parallel with the motion of a bird's wing.

Probably the exhibition marks a distinct period in the history of aerial navigation, and, although no great flights may be expected in the trials to be held in the Alexandra Palace grounds on Monday next, it is evident that experts are now seriously studying the subject, learning from each other's failures and being guided by the accumulated knowledge contributed by all the countries of the world. For the thirst for aerial flight is as international as the motor-car.

AN examination of the motor-car drivers employed by the Duke of Portland has been held at Welbeck.

THE VAGARIES OF MOTOR VEHICLES.

BY A. J. MCKINNEY.

THERE is a funny story told of two men who began disputing about the appearance of a particular tower, each maintaining that it was different to the description the other gave. Very shortly they fell to fighting and were hard at it until a passer by enquired the reason. On learning the cause he rebuked them, pointing out that both were right but both were also wrong. Each had correctly described the tower from his point of view, but had not taken the trouble to look at the other side. It is much the same with motoring. Not so long ago most people were anti-motorists, and obloquy and derision were the mildest treatment extended towards the more enlightened section of the population. In another way now there are still two very pronounced classes of people, though fortunately the quarrel is not a personal one. These concern the relative point of view taken of motor vehicles themselves, one class pointing out how reliable they are and the other affirming the direct opposite. Both of course are right, within limits; but the question must be viewed generally, since no individual cases can form universal law. Allowances must be made for many stoppages which are more or less voluntary or the driver's fault, while at the same time no car can be guaranteed to be absolutely immune from trouble.

The motor vehicle is a wonderful illustration of the Latin proverb "multum in parvo," for the number of component parts of a complicated and delicate nature is large. The question appears at first sight to be very simple, only to mount an engine and couple it up to the driving wheels. Yet what a record of disappointment, trouble and disaster the history of this movement affords; the difficulties connected with the steering, cooling, transmission, ignition, carburation, &c., are fresh in our minds, where they have been burnt in by the hot iron of bitter experience. Nowadays the picture is very different, for it is a fairly common thing for cars to run 1,000 miles and more without stops arising from any inherent fault or imperfections. Still, in spite of the progress made in motor vehicles, and the general high standard of skill amongst motorists of to-day, it must be said that there is some ground for those who say that these vehicles are as yet by no means absolutely reliable. There are so many things that can go wrong, trivial in themselves yet enough to cause a stop, so that there is foundation for the assertion of the "uncertainty" of motor vehicles. Yet after all the question is a relative one. No one, for example, would be foolish enough to demand or expect absolute certainty, for even railway trains are liable to break down in spite of their long history and the favourable conditions under which they are run. Therefore, when a fair comparison is made, allowing for the difference in the circumstances, it will found that the motor vehicle is not such a bad second after all.

Having admitted this, we may glance at some of the reasons to which stoppages and delays are sometimes due. The Rajah of the Kanker State, India, when he bought his first motor-car sent one of his native servants to Bombay to learn to drive it. This man, when he returned, had profited to such an extent that he had to "set the levers so, to turn the handle and drive." No wonder that under these conditions the car stopped through no fault of its own. On the other hand, in these enlightened times it is safe to say that a large percentage of the stops is due to the little idiosyncrasies of the details included under the term of motor-car. The day will come to all, even the best behaved of cars, when it seems lifeless and pulls badly. Sometimes it is the engine which is the cause of the trouble, as, for example, when a particular car I knew became very noisy and seemed to drag heavily. Inspection showed that the holding-down bolts on one cylinder had worked slack so that the piston was binding in it. In another case the piston rings broke continually every few miles, fortunately without doing much harm. When made of another alloy they proved perfectly satisfactory. An engine in which the combustion head was separate from the cylinder suddenly blew it right off, sending it upwards through the bonnet, while another of the same make could never be made to develop more than about 20

per cent. of its original h.p. after being fitted with a new piston. When the hydraulic test was applied the cause was seen, the piston-head was porous. Owing to a want of appreciation on their part of this possible cause, two men's time for five weeks had been wasted. Two other causes of sudden loss of compression occurred when the centre of a sparking plug was shot right out, and where an inlet valve of the light automatic type broke. When the valve was replaced a start was hardly made when the compression went off again. Baleful language issued from the driver's lips as he undid the valve caps, of which there were two, and found the valves were both sound. Further investigation showed that the spring which belonged to the former valve had shot up one branch of the induction pipe and run down the other to the second valve, which it had kept from closing.

The clutch is another member which can give a great deal of trouble if so disposed. The breakage of this article put one of the competitors in the last T. T. race in the Isle of Man *hors de combat*. Slipping, fierce, and locked clutches are too well known to need reference to, and fortunately the newer types of disc, metal-to-metal cone, and other patterns have practically exterminated this hydra-headed terror. Like a snake in the grass the innocent looking gear-box has been, so to

Col. Colin Campbell, of Stanmer Park, Falmer, Sussex, in his 40-h.p. Six-cylinder Napier Car. Col. Campbell, who married a sister of the late Lady Curzon and the Countess of Suffolk, for some time owned the first Napier car ever built.

speak, known to raise it crested head and cause worry to the poor human at the wheel. One car was afflicted with a slipping striker which would not stay in the correct position more than an hour or so. The top speed (direct drive) could be put in and the car would run along sweetly, when dur-dur-dur-dur-dur, and the dog clutches would jump and jar. The trouble is still uncured.

(To be concluded.)

BODY design is progressing steadily, what with the special body-building departments opened by car manufacturers and the attention given to the requirements of motorists by carriage builders who have added motor-body work to their older established departments. One of the most distinctive bodies in design, and also one of the most comfortable in practice, is the new one just produced by Maythorn and Son for Mr. G. S. S. Monck, chairman of Horch Motors, Ltd., to that gentleman's own design. A feature of the design is that it gives the Horch car a most comfortable driving seat, a little matter which will appeal with force to those who drive their own cars.

THE CRAVEN AUTOMATIC CARBURETTOR.

WE give herewith a sectional view of a new automatic carburettor which has recently been put on the market by Messrs. Cravens, Ltd., of Darnall, Sheffield. The device differs but little from other carburettors, it having a float chamber, petrol spraying chamber with choke tube above, and single air inlet below. The particular feature which forms the subject matter of the patent, and which is claimed to effect a considerable economy in petrol consumption, is the connection from the top of the float chamber to the spraying chamber, indicated by arrows. This connection is not limited in size, and, as a consequence, the patentees claim that instantaneous action is secured without any "time lag" entering into the movement. The petrol emerges from the jet under a head or pressure determined by the size of the atomising sleeve, the suction of the engine, and the opening to the atmosphere. The latter can be fitted with a regulator, for setting to the correct percentage of fuel to air required—this being found by trial at a slow engine speed—so that when the vacuum round the jet increases, due to the acceleration of the engine, the

vacuum between this point and the air opening—and, consequently, on top of the petrol in the float chamber—also increases in the same proportion, and the petrol emerges from the jet under the same proportional head or pressure, viz., the difference between the amount of vacuum in the two separate compartments, this difference being constant at all speeds of the motor. The larger the opening or entrance for air, as compared with the bore of the sleeve around the spraying nozzle, the greater the difference between the amount of vacuum in the float and spraying chambers, and, therefore, the greater the pressure causing the petrol to issue from the jet. With a given sized jet, if the mixture contains too great a percentage of fuel, it is only necessary to reduce the air opening by the regulator until the correct mixture is obtained. The carburettor will then supply this mixture at any engine speed without any further alteration, irrespective of the position of the carburettor throttle. There is a limit to the permissible variations between the area of the air sleeve and the exterior air admission opening, beyond which the column of petrol issuing from the jet would be at too great a velocity. The new carburettor is being made in sizes suitable both for motor-cycles and cars.

THE Ontario Motor League is being formed in Canada to carry on in the colony the "good roads movement," which is doing such useful work in the United States of America.

A HILL-CLIMBING EXPEDITION.

A HILL known as Hog Trough Hill, on a little-known bye-road from Cudham to Brasted, having hitherto enjoyed the distinction of never having been surmounted by a motor-car, an interesting expedition thereto was made on Thursday last week, the participants including a 35-h.p. Daimler, a 30-h.p. Westinghouse, two 40-h.p. Spykers, a 20-28-h.p. Spyker, and a 24-40-h.p. F.I.A.T. The first car to attempt the ascent was the F.I.A.T., with five aboard. The road itself looks easy enough from the bottom, but after about a sixth of a mile it turns suddenly, and ascends at a gradient of 1 in 4.3. The driver of the F.I.A.T. had not reckoned upon the suddenness of this turn, nor the uneven surface of the road. Changing to his first speed too late for service, his car came to a full stop. Thereupon he backed down to the foot of the hill again to make a second attempt. The 40-h.p. Spyker, with five people up, was the next to essay the climb. Proceeding on top speed to within a dozen yards of the turn, a change was made on to second, and on this gear the steep, rubbly hairpin bend was successfully negotiated. Following the Spyker came the 35-h.p. Daimler, which breasted the ascent very easily up to the difficult corner, and thereafter dropped into first speed, on which it completed the rest of the journey without difficulty. A second Spyker, with four aboard, came next, and did the whole journey on second. Then followed the F.I.A.T., this time with only two passengers, and, of course, romped up quite easily, changing to first in ample time to meet the most difficult part of the road. The Westinghouse, a formidable-looking car, with four up, dropped into first speed some distance down the hill, and thus had plenty in hand to finish. The last to make the hill was the 20-28-h.p. Spyker, with two aboard, but this was unable to equal the record of its predecessors by keeping on second speed all the time—it being obliged to drop down to first. The particular hill on which this climb was made is known as Cudham Church Hill, and is the continuation of the road from Downes to Cudham. A notice board of the District Council at the top of the hill warns vehicles against descending without a skid pan, and officially gives the grade at 1 in 4.3.

THE committee of the Auto-Cycle Club have slightly modified the conditions of the forthcoming International Auto-Cycle Tourist Trophy contest. The tank must now hold at least one and a quarter gallons, as against two gallons under the old rule. In order to encourage the entry of multi-cylinder engined machines it has been decided to class such machines separately, and the consumption of fuel allowed to them will be one gallon to each seventy-five miles.

MR. H. T. BURBURY, driving a steam car, called at the Bridge Garage, Leeds, to have a slight repair done. He himself superintended the work, which consisted of soldering one of the pipes from the petrol tank, and in doing this he loosened one of the couplings without, apparently, first releasing the pressure in the petrol tank; the result was that a jet of spirit was forced out and saturated his clothing, also catching fire from the heated burners. Prompt assistance was at hand, and with the aid of a chemical fire extinguisher and sand the fire was quickly overcome.

THE first 1,000 miles Reliability Trial held in Ireland under the auspices and official observation of the Irish Automobile Club has just terminated, when Capt. Deasy, on a 24-h.p. Deasy car, completed the distance of 1,024½ miles. The mileages of the daily runs were as follows:—Dublin to Cork, 173½; Cork to Killarney, 337; Killarney to Lisdoonvarna, 517; Lisdoonvarna to Sligo, 706½; Sligo to Garron Point, 881; Garron Point to Dublin, 1,024½. The route taken was thus a complete tour of Ireland, and every day the car ran successfully and to the complete satisfaction of the official observers, notwithstanding the heavy and rough surface, the Irish roads, especially at this time of the year, providing an exceptional test for any car.

SOME CURRENT TOPICS.

The Cordingley Show.

The attention of the automobile world has this week been centred on the Agricultural Hall, where the twelfth of the annual exhibitions organised by Mr. C. Cordingley is in progress. The Show was unfortunately not in quite so advanced a state on the opening day as was desired, owing mainly to the intervention of the Easter holidays. By Monday a considerable improvement was effected, although even then several interesting productions, for which space had been taken, had not put in an appearance, amongst these being the Rennie cars, whose absence is due to a serious fire at the company's works, and a new steam 'bus which the Yorkshire Steam Wagon Company were unable to complete in time. Notwithstanding this, however, the exhibition is marked by the appearance of quite a number of new cars, both British and Continental. Of the former we may mention the Roydale and the All-British, the eight-cylinder motor of the last-named being especially worthy of notice; while notable among the new-comers from Germany are the Adler, Nacke and Horch cars. Another feature of the Show is the display of petrol-electric vehicles, those on view including the Auto-Mixte, the Mercedes-Mixte and the Hart-Durtnall, the latter company showing a double-deck 'bus, the quiet running of which augurs well for its success.

Waiting for the Ferry.

getting a car ready for a projected run, and when this was done, and everything was ready for a start, all were hopeful, but not confident, of getting home without a breakdown of one kind or another, for it was rarely that a spin of fifty miles or so could be undertaken without some incident arising. Many are the tales that could be told of experiences on the road with these early machines, and, although not without their annoyance at the time, we believe that the older generation of motorists look back with pride on the part they took in the initial stages of educating the public to the coming revolution in road traffic. Nowadays long excursions are undertaken and hardly any fears are entertained as to the possibility of making a non-stop run of a hundred or more miles. On the contrary, a motorist would be rather disgusted should his car fail in such an attempt, even with no more preparation than would be given by filling up with petrol, oil and water.

Experiences Invited.

This degree of reliability is one of the most evident marks of improvement in the industry. At the same time we have not yet reached the point when accidents cease from troubling, and those who served their apprenticeship when a repair had to be made every few miles still find occasional opportunity of putting to useful service their knowledge of the derangements motors may be subject to. Because an accident is unlikely its

Disembarking from the Ferry.

[De Auto.]

MOTORING IN JAVA.

Six-Cylinder Cars.

The tendency of the times is seen in the increasing number of six-cylinder cars which are making their appearance on the market, the 1907 Cordingley Show marking the introduction of several new vehicles of this type, among them being the S.P.A. and Florentia, two Italian productions of the highest grade. Other exhibitors of "sixes" include the Star Co. and Messrs. Brown Brothers, Ltd., while those interested in seeing what can be done in the way of producing a six-cylinder car at a moderate price should by no means omit to inspect the "Hurmid" and "Malcolm" vehicles, both of which find a place in the Great Hall. This brief survey by no means exhausts the list of novelties and attractive exhibits, a report of some of which appears elsewhere in the present issue.

Roadside Repairs.

There are few if any parallels to the wonderful strides that have been made in the short space of ten years in automobilism and in automobile construction. The modern luxurious and silent running car bears but the faintest semblance to the troublesome yet pleasurable vehicles with which the pioneers of the movement enjoyed themselves in more ways than one. In the early days of the Act considerable time had to be spent in

seriousness is not lessened, and although breakdowns may be few, that makes it no easier to get home when one does occur. It is in cases like these that the ingenuity of motorists is called into play. It may be a broken universal joint that has caused the stoppage, or a broken cardan shaft, a stripped pinion, or even a much smaller and simpler breakage. We know of one instance where the cotter pin holding the contact maker to the half time shaft was lost—owing to it not having been sufficiently firmly fixed in place—allowing the latter to revolve without carrying with it the necessary make and break device of the ignition and so stopping the engine. It was late at night, and a search through the tool box brought to light nothing that would replace the lost pin. Fortunately, a cottage was near, where the only likely thing that could be obtained was a French nail, and it was by means of this temporary repair that home was safely reached. There must be scarcely a motorist who at one time or another has not had to exercise his ingenuity in consequence of a breakdown, and it would, we feel sure, be of interest to other readers of the *M.C.J.* if those who have been called upon to make roadside repairs would send us a brief account of the difficulties they have been in, and the way they have surmounted them to enable their destination to be safely reached.

CONTINENTAL NOTES.

A Revolution in Motor-Boat Propellers.

Advices from Brussels suggest that a radical revolution in the method of propulsion of motor-boats will result from the invention of a propeller of novel design by M. John P. Koch, of Antwerp. The propeller, which, it is asserted, will produce abnormal speed, is of huge dimensions, its circumference equalling the girth of the craft at its bulkiest point. By the rapidity of its revolutions the propeller, which is located in the front of the boat, produces a perfect vacuum, into which it rushes, dragging the hull, which is almost wholly submerged, after it. By reason of the vacuum produced the resistance of the element is claimed to be reduced to a minimum, while there is also a complete absence of "cavitation" (stern suction). The boat about to be built is to be fitted with a propeller 7 ft. in diameter, and a motor of 100-h.p.; the length over-all will be about 45 ft. It is hoped that the vessel will be finished in time to compete in the motor-boat races at Arcachon. M. Koch expects his boat to attain a speed of seventy-five miles per hour! Trials of the latest model were recently made in the lake at

motor-car from Paris to Nice in considerably less than 17 hours. He left Paris on a 60-h.p. De Dietrich at two o'clock in the morning, and arrived at the Place Masséna at Nice at 6.15 p.m., having covered the thousand kilometres (625 miles) between the two places in exactly 16 hours 15 min., or an average speed of nearly forty miles an hour. On the way he stopped only five times—a quarter of an hour at Avallon, half an hour at Lyons, a quarter of an hour at Orange, half an hour at Aix, and five minutes at Frejus. No trouble of any kind, not even a puncture, was experienced on the run.

The Pekin-Paris Trial.

Active preparations are being made for the great Pekin to Paris motor-car trial, which is being organised by "Le Matin," of Paris. At first it was proposed to select a route through Central Asia, but that idea has now been abandoned, and the route chosen will lie through Mongolia, Siberia, and European Russia. The distance is about 6,200 miles, and over roads which will severely test the reliability of the competing cars. From Pekin the line lies through Kalgan, Urga, Irkutsk on Lake Baikal, Kansk, Tomsk, Omsk, Petropavlosk, Kurgan, Zlatoub,

The 10,000 kilometre tour of France.—M. Van Marcke arriving in Paris at the end of his long trip on a Hotchkiss Six-cylinder Car.

Tervueren, near Brussels, and were, we are informed, highly satisfactory. The model, which is 4½ ft. long and is driven by a small electric motor of 1-16-h.p., travelled upwards of 20 ft. per second in a spin over a quarter of a mile, or at the rate of nearly fourteen miles per hour.

A Belgian Industrial Vehicle Trial.

A three days' trial of industrial motor vehicles organised by the Belgian Automobile Club commenced on Monday last, the competitors comprising a 20-22-h.p. Orion 3-ton lorry, a 30-h.p. Saurer 3½-ton lorry, a 12-h.p. Bovy-Dheyne 30-cwt. van, a 12-h.p. Bovy-Dheyne 10-cwt. van, a 20-24-h.p. Brillié 5-ton lorry, a Brillié 26-seated brake, a 24-h.p. Janvier 5-ton lorry, two 24-h.p. N.A.G. 5-ton lorries, and a Mauguy carrier tri-car. On the first day the run was from Brussels to Antwerp, 68 kilometres, on Tuesday from Antwerp to Ghent, 70 kilometres, and on Wednesday from Ghent to Brussels, 60 kilometres.

Paris to Nice in Sixteen Hours.

M. Sorel, the winner of the Pyrenees Cup last year, accomplished the remarkable performance on Sunday last of driving a

Kazan, Nijni-Novgorod, Moscow, Warsaw, and thence through Germany and Belgium to Paris.

Public Motor Services in Germany.

A company is being formed at Sellin to establish a public motor-car service between that town and various pleasure resorts in the district. It is also contemplated to establish similar services between Scharbeutz, Timmendorf and Travmunde.

Miscellaneous Items.

Originally announced to take place on April 28th, the Chateau-Thierry hill-climbing competition has been postponed until September 15th.—The Saxon Government has appointed a Commission to inspect the roads in Saxony over which the cars taking part in the Herkomer Trophy Contest will run, with a view to putting the same in good condition in time for the event.—Among the British firms which have taken space at the forthcoming exhibition in Madrid are the Daimler, Straker-Squire and Iris.—The 10,000 kilometre tour of France by a six-cylinder Hotchkiss was successfully completed on Friday last week, when a large crowd gathered in the Place de la Concorde, Paris, to welcome M. Van Marcke.

THERE are now thirty-three entries for the Tourist Trophy Race.

IN the reliability Trial of the Midland A.C. six out of thirteen cars obtained the maximum number of marks. Of these three were Siddeleys—a 30-h.p., 15-h.p. and 18-h.p. The others were a 30-h.p. Darracq, 28-h.p. Lanchester and 16 h.p. Star.

MESSRS. COLIN DEFRIES, LTD., have received an order from Messrs. Bewick, Moreing and Co., the well-known mining engineers, for a 24-h.p. Porthos car for shipment to Australia.

THE Britannia cars built by the Britannia Engineering Company, Colchester, are now being introduced into the United States, the first car having just arrived in New York.

THE County Motor Company of Grace Hill, Folkestone, is the new name of Messrs. Blenchley Bros. and Holman, whose good motor work is appreciated by many visitors to that resort.

THE Cadogan Garage and Motor Company, Ltd., Chelsea, inform us that they have decided to call their cars the Cadogan, and not the Leander, as stated in the catalogue of the Cordingley Show.

AMONGST recent purchasers of Daimler cars is Captain the Right Hon. Gerald Portman, late A.D.C. to Lord Curzon in India, who has ordered a 10½ ft. wheelbase 30-h.p. "Milverton" landaulet.

THE glassless motor goggle, known as "La Steno," is being placed on the British market by the Goldschmidt Motor Accessories Company, Ltd. By its use the draughts often associated with goggles are prevented, and "La Steno" should become as popular here as in France.

WE learn that during its daily run on Tuesday the 40-h.p. Siddeley car, which is undergoing a long distance reliability trial, succeeded, near Matlock Bath, in beating the existing long-distance record, which has hitherto stood at 4,007 miles. The total distance completed by the Siddeley car is now over 7,000 miles, only one involuntary stop having been recorded.

MESSRS. BOLSOVER BROS., LTD., Eaglescliffe, Co. Durham, after experimenting for two or three years with the various welding processes, have finally installed an oxy-acetylene welding plant with the most satisfactory results. By this means the firm are in a position to weld broken exhaust valves, cracked water jackets, crank cases, &c., at less than half the actual cost of new parts, the welded parts being in all respects equal to new.

COINCIDENCES are rather frequent just now down Reigate way, and one policeman at least is not pleased with their frequency. Good Friday was a beautifully fine day, and the air on the top of Reigate Hill being particularly bracing, a certain inspector thought that he would take a walk up the steep ascent and see how things looked from the top. Incidentally, as there were many motor-cars passing to and fro, he perhaps hoped to do a little business in the way of fine collecting. By a curious coincidence, an Automobile Association patrol also came to the conclusion that the air on top of the hill would be good for his health that afternoon, so he too, pushing his bicycle, strolled casually in the same direction. This is coincidence No. 1; now for the second. About the same time of day a constable on the Sutton-Reigate road decided to extend his beat to the Tea House near the top of Reigate Hill. Strangely enough, an Automobile Association patrol happened to be going in the same direction. A third constable in plain clothes was lounging aimlessly in front of the Tea House, apparently with no particular business on hand. An Automobile Association patrol, who seemed to have nothing better to do, was also in the neighbourhood. Now it will be seen that as the inspector moved on the Tea House in one direction and the constable in another, the three policemen met simultaneously with the three patrols. The inspector, like a true strategist, took in the situation at a glance, and decided that it was high time for afternoon tea. If he had had a keen sense of humour he might have invited the patrols to join him. But he preferred leaving them to watch outside, where, when this history closes, they were still waiting for further coincidences.

HERE AND THERE.

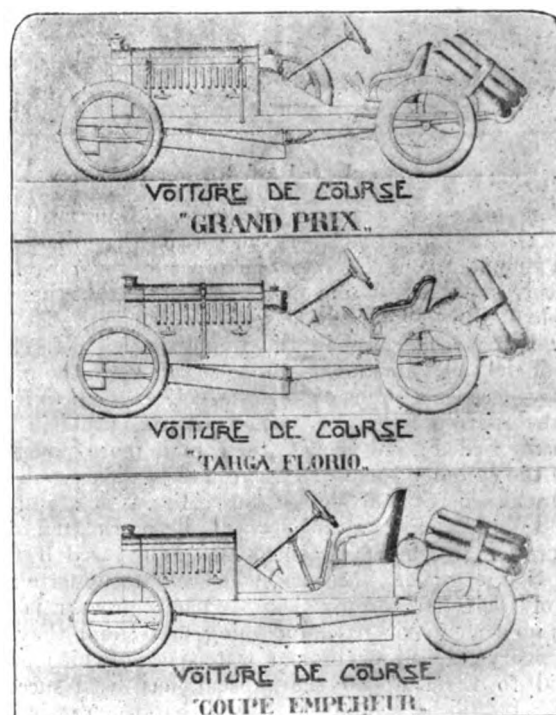

A NEW garage has been established at King's Lynn by Mr. L. E. Taylor. It is located on the London road and contains an inspection pit.

ENTRIES close on the 18th inst. for the Frome's Hill climb of the Herefordshire A.C. at ordinary fees, and at double fees on the 22nd inst.

APART from the aeroplanes at the Agricultural Hall, London, there is a suggestive balloon section, in which the baskets of new or famous balloons are shown by Messrs. Spencer Bros., Messrs. C. G. Spencer and Sons, Messrs. Short Bros., and Mr. A. E. Gaudron.

MR. J. D. SIDDELEY was recently commanded to attend at Sandringham, when Her Majesty the Queen expressed her great satisfaction with the new 30-h.p. Siddeley car which has been built for her by the Wolsley Tool and Motor Company, Ltd., and honoured them with a further order for a larger and more powerful car.

THE illustration reproduced herewith shows the designs of the special cars which Messrs. De Dietrich are building for the

three principal events this year, viz., the Grand Prix, the Targa Florio, and the Coupe Empereur, or Kaiser's Prize contest, and is a proof of the interest this firm are taking in these races. All three cars are different, as will be seen from the various sizes and positions of the petrol tanks.

MESSRS. TANGYES, LTD., of the Cornwall Works, Birmingham, are introducing a new motor-car jack for vehicles weighing up to 35 cwt. The arrangement of the driving worm, which is provided with a sliding as well as a rotary motion, is a distinctive feature of the device. Having placed the jack in position under the axle, the head of the rack is lifted by the hand—an operation that automatically slides the worm out of gear. Immediately the head of the rack is released the worm falls into position and the car is then raised by a lever. The lowering is effected by merely reversing the lever till the head of the jack is free, when the rack can be instantly lowered. The Tangye patent motor-car jack has no mechanism likely to get out of order, is compact, light and strong, and adds a reliable device to the tool box of the motorist. We understand it is the intention of Messrs. Tangyes, Ltd., to bring out a heavier jack of similarly effective design for use with motor-omnibuses and heavy vehicles.

D.

IN the Haymarket, Edinburgh, the Peebles Motor Company are opening a new garage.

COUNCILLOR HAMPSON has suggested, at a meeting of the Blackpool Town Council, that an attempt should be made to limit the speed of cars to ten miles an hour on entering the town.

MANY motorists who neglected to take the precaution to run the water out of their tanks, radiators, and cylinder jackets during the recent frosty weather will be suffering the effects of the same, the frost having unfortunately cracked the water-jackets of their cylinders. The accompanying illustration (Fig. 1) shows an interesting view of a cast-iron water-jacket which has had a large-sized piece burst clean out by the frost,

Figs. 1 and 2.

the broken piece being shown alongside. Many will wonder why it is that the water-jacket is the portion that usually bursts, for, as a rule, it is connected to the pipes by india rubber connecting tubes, and it would at first sight appear that these should be capable of allowing for the necessary expansion. The reason, however, is that the water in the connecting pipes freezes first because of the small amount of water contained in the pipes and the relatively large amount of pipe surface exposed to the cold. When these are frozen the outlets of the water-jacket are hermetically sealed; and when, after a little more exposure, the water in the cylinder jacket freezes, the expansion usually forces out or cracks a portion of the casting. Fig. 2 is an illustration of the same casting, after having been repaired by the special process, which has recently been introduced by Messrs. Lea and Son, engineers, Runcorn, who are now undertaking the repair of cast-iron water-jackets. Their process is purely metallic, no cement nor patching being used; and they inform us that every cracked or broken water-jacket which has been submitted to them up to the present has been successfully repaired. It will be seen from Fig. 2 that the repair is very neat, and is scarcely discernible.

MESSRS. A. KEAN AND CO., who are interested in the motor business of Hereford, and have branches at Coleford and Cinderford, have established a garage in a new building in Union Street, Hereford, where they have ample facilities for assisting motorists passing through the city.

THE new motor house premises of the Royal A.C. have entrances at 108, Piccadilly, and Brick Street, and will be ready for occupation on the 18th prox. There will be accommodation for upwards of eighty cars, and it is the intention of the Royal A.C. to establish a laboratory there for the purpose of testing brake horse-power, carburettors, &c.

THE Gobron-Brillie Motor Company, Ltd., are making arrangements to start a service of motor-cars plying between London and Paris. This will probably commence on May Day, starting from the company's offices in Piccadilly, W., and arriving in Paris the same night at eight p.m. The route taken will be:—From London, *via* Maidstone, to Folkestone, and thence to Boulogne by boat; Boulogne to Montreuil, 27½ miles, and Montreuil to Abbeville, 25 miles, thence to Grand Villiers, 30½ miles; Grand Villiers to Beauvais, 18 miles; and on to Pontoise, 27½ miles; to St. Germain-en-Laye, 12 miles; and to Paris, 10½ miles; a total of 151 miles from Boulogne.

MESSRS. MARK AND CO., of 6, City Road, London, E.C., are introducing a new shock absorber, known as the Traffault-Hartford, for use in connection with the springs of motor-cars. It is constructed of spring steel throughout, and can be applied to any make of car.

FROM the Pope Manufacturing Company, of Hartford, Conn., U.S.A., come two artistically-designed catalogues dealing with the Pope-Toledo automobiles. Special attention is devoted to the Pope-Toledo model No. XV., which is a 50-h.p. vehicle, having four cylinders, with copper water-jackets and mechanically-operated valves located in the cylinder heads.

WE briefly referred in our last issue to the excellent report which the club engineer had made of the 14-h.p. Star car which Mr. F. R. Goodwin, of the Star Motor Agency, supplied about a year ago to the Royal Automobile Club. Mr. Goodwin has since sent us a copy of a letter he has received from Mr. J. W. Orde, the Secretary of the R.A.C., in which it is stated that the car was delivered in February, 1906, and was at once put into use for teaching members of the Club and members' servants the art of driving. "The log-book shows that the car has now run over 10,000 miles; number of lessons given, 552; number of candidates examined in connection with the Club's Certificates Department, 318. The cost of repairs and replacements to the mechanical portion of the car for thirteen months has been *nil*. At the end of the time it was deemed advisable to dismantle the car to ascertain the amount of wear on the mechanical parts, and I am pleased to inform you that the Club have every reason to be satisfied with the result of this examination. The gears show only the slightest wear, and the ball bearings to same are perfect. Regarding the engine only one of the big end brasses wants attention, the gudgeon pins being unmarked. The valves and springs are the original ones supplied with the car, and are in excellent condition. The chains and chain wheels are also in excellent order and apparently fit for a lot of work yet." Having in view the conditions under which the car has been run, the performance is an excellent testimony to the reliability and durability of the Star cars.

WE illustrate herewith a new sparking plug, known as the "Albo-Luthi," which has just been put on the market by Messrs. Brown Brothers, Ltd. As will be seen, it differs considerably from the ordinary pattern, the double dome protector preventing any fouling of the porcelain and misfiring owing to short circuits. The electrodes are of pure nickel, while the various parts are

made on the interchangeable system, and so fitted that they can be readily taken apart. It is claimed that the new plug is capable of withstanding the highest temperature and that it is waterproof, the washers being of compressed asbestos. A plug on similar lines, but with mica in place of porcelain, is also made, this being known as the mica "Albo-Luthi."

THE Gordon Carriage Works has been established in the Harders Road, Peckham, S.E., to devote attention to the production of motor bodies. The proprietors have early distinguished themselves by the introduction of a new wind screen, which possesses distinctive features of considerable merit. It is known as the Gordon, and will be found in the Gallery at the Cordingley Show.

The Cordingley Show.

(Continued from page 118.)

CORDINGLEY'S Motor-Car Show and Aero Club Display has attracted the motoring world to the Agricultural Hall, London, during the week, and by the time the doors close at 10 p.m. on Saturday, the 13th, few who follow the doings of the movement with keenness will have failed to see this year's Exhibition. The present is the twelfth of the series, and has again demonstrated the popularity of the Cordingley Show as presenting a representative view of the motor-car industry in its many aspects, as well as an indication of

PETROL VEHICLES.

The Bristocar Motor Lorry.

The BRISTOL WAGON AND CARRIAGE WORKS COMPANY, LIMITED, of Lawrence Hill, Bristol, who have recently taken up the construction of commercial vehicles fitted with petrol engines, exhibit for the first time a lorry for loads up to 25 cwt., in which there are a number of interesting features, notably the accessibility of the various parts. The engine, which is rated at 12-16 h.p., comprises two separate cylinders, 4½ mm. bore by 5 mm. stroke; it is of the slow-running type, the normal speed being 900 revolutions per minute. The valves are all operated

General View of the Show.

'the next line of advance,' viz., aerial navigation. In its many branches—commercial and pleasure vehicles, petrol and electric cars, heavy lorries and lighter automobiles, as well as in accessories and the like, the Show gives a capital idea of the advance that has been made, thus sustaining its educational character. As our readers have doubtless seen for themselves, the Press have been warm in their praise of the event, which, as the *Sphere* remarks, "is twice justified" in the fact that "the selling season begins at Easter and lasts until the early autumn." That it has commenced has been amply demonstrated by the business done at the Show, which has amply rewarded the exhibiting firms for their enterprise and loyalty to the pioneer motor exhibition in this country. Herewith we continue our report of the various stands.

off a single cam shaft, the arrangement of the inlet and exhaust pipes being such that they can be detached with a minimum of trouble. The ignition is by means of coil and accumulators, and it is worthy of note that the governor which is provided is so connected up that it automatically advances or retards the spark, and at the same time varies the quality of the mixture in accordance with the speed of the motor. The control of the engine by the driver is thus reduced to the manipulation of the throttle lever. Large hand holes are provided in the aluminium base chamber, to give access to the big end bearings on the crank shaft. The transmission is through a leather-faced cone clutch to a three-speed and reverse gear-box, universally jointed shaft and differential, and thence by side chains to the rear road wheels. Ample brake power is provided, and the body, which may be of the open or closed type, is hinged at the rear, so that it may be tilted up to enable any of the working parts to be easily reached. The arrangement of the radius rods and of the rear springs is another point to which attention may

be drawn. The ends of the latter are not fastened to shackles, but are connected with hardened steel rollers which are free to work in slides formed on the frame. In this way they are able to accommodate themselves to the load being carried, and at the same time it is an easy matter, in case of necessity, to remove the rear road wheels, together with their axles and springs. The vehicle, which made an excellent run up by road from Bristol to the Show, appears to have been well thought out, and we learn that another on similar

rocking hinges, the hinge stud being formed of the stock of the lamp bracket. Special attention may be drawn to the engine lubrication system. The supply of oil is maintained by gravity from a drip feed lubricator set upon the dashboard. This tank is, however, kept replenished by means of a small pump, which draws the oil from a long sump attached to the base of the crank chamber. The oil drips over the bearings, and, falling into the pump, is pumped back into the lubricator. In this way the motor cannot give off smoke owing to over-lubrication,

Fig. 4.—Chassis of Nacke 35-37-h.p. Car.

lines, but fitted with a four-cylinder engine, is also in course of completion.

The Nacke Car.

A new German car, seen for the first time in this country, is the Nacke (Fig. 4), which is displayed on the stand of Messrs. BOULT, TAYLOR AND Co., the British agents. The chassis on view is of the 35-37-h.p., and, while following the now generally-accepted lines, the various details appear to have been well thought out. The frame is of pressed steel, the side members being narrowed at the front in order to increase the lock of the steering wheels. The four cylinders, which are 110 mm. bore by 140 mm. stroke, are cast in pairs, with the valves located on opposite sides, and operated off separate cam shafts. The latter are readily accessible, running in bearing cases independent of the crank chamber. The half-time gear wheels are enclosed in a separate and easily accessible gear-case in front of the crank chamber. A special form of automatic carburettor is employed to furnish the mixture, the supply of petrol to the jet being varied in accordance with the degree

while, even if the pump should from any cause fail, the lubrication can still be maintained by gravity. The power is transmitted through a large leather-faced cone clutch and a jointed shaft to a gear-box, giving four speeds forward and a reverse, with direct drive on top, the control being by a lever working in a "gate." The final drive is by side-chains from a differential shaft. The brakes are of substantial construction, and are provided with a simple means of hand adjustment; ball bearings, it may be added, are fitted to all parts except the engine. A Nacke 14-h.p. 2½-ton chassis, designed for commercial purposes—it can be fitted with either a lorry or van body—is also on view. This is equipped with a four-cylinder engine, the speed of which is regulated by means of a variable lift to the inlet valves. The motor and gear-box are supported on a sub-frame of channel steel, a long cardan shaft connecting the change-speed gear with the differential shaft, from which the power is conveyed to the rear road wheels by side chains. Altogether the Nacke cars, which are made at Coswig, near Dresden, by Herr E. Nacke, appear to be of high-grade construction, and are well worthy of close inspection.

Fig. 5.—Chassis of Florentia Six-cylinder Car.

of opening of the additional air-valve. Two ignitions—high-tension Simms-Bosch magneto and coil and accumulators—are fitted. The magneto is driven by gearing from the centre off the exhaust valve cam shaft. A centrifugal governor is provided in a separate casing, this being connected to the throttle. The speed of the engine can also be controlled either through the lever on the steering wheel or by a small pedal on the footboard. The water circulation is maintained by a gear-driven pump and a special form of radiator; the latter, which is, as usual, provided with an air-inducing fan, is supported on both sides on

The Florentia Cars.

Principal interest at the stand of the FABBRICA DI AUTOMOBILI FLORENTIA, of Florence, Italy, represented in England by Messrs. M. de Brou and Co., Ltd., is the chassis of the new 40-h.p. six-cylinder car, which is now shown for the first time, and of which we give an illustration in Fig. 5. The six-cylinders, which are cast in pairs, are 100 mm. bore by 140 mm. stroke. The M.O.V. valves are located on opposite sides, and the ignition is by high-tension magneto. The mixture is furnished by a special design of automatic carburettor. The

adiator is of the honeycomb type with fan, the induction of air being also assisted by a fan formed in the flywheel. The lubrication of the engine is effected by the pressure of the exhaust, the oil passing through neatly arranged sight feeds on the dashboard. The clutch is of the multiple disc type, and the change-speed gear, which is controlled by a lever working in a "gate," is adapted to give four speeds forward and a reverse, with direct drive on top speed; the final transmission is by cardan shaft and bevel gear to a live axle; the latter has only the driving strain to withstand, the drive to the rear wheel hubs being by the square ends of the axle,

tioned that the object of the designer has been to so arrange the leading components that any of them may be readily detached without disturbing the others. The cylinders, which are 130 mm. bore by 136 mm. stroke, are cast in pairs, and have the valves arranged on opposite sides. The carburettor is of a special automatic type, claimed to give an exactly proportioned mixture at all engine speeds. The ignition is by low-tension magneto, the make and break of two cylinders being actuated by a single cam mounted on the upper end of a spindle which passes up through the cylinder-head casting, so giving free

Fig. 6.—Chassis of S.P.A. 60-h.p. Six-cylinder Car.

the weight of the car being carried by the sleeve. The usual dumb irons at the rear are replaced by halves of semi-elliptical springs. We may add that ball bearings are used throughout except the engine. Of the 20-30-h.p. four-cylinder Florentias there are on view a chassis, a double landaulet, the body of which is by Messrs. Morgan and Sons, and a double landaulet by Messrs. Windover. We have already given a description of this type, but it may be briefly mentioned that, except as regards the number of cylinders, the general arrangement is similar to that of the 40-h.p. vehicle above described. Finally reference may be made to a handsome 40-50-h.p. with double landaulet body, by Messrs. W. Coles and Sons. In this vehicle the four cylinders of the engine are 140 mm. bore by 160 mm. stroke, and are separately cast. The ignition is by low tension magneto, and the final transmission by side chains. The frame, too, is worthy of notice; it is of pressed steel, with the cross members electrically welded in place, no rivets being employed.

The S.P.A. Cars.

Among the most interesting of the new cars which make their first public appearance in this country at the Cordingley Show are the S.P.A.,

access to the valve springs, and enabling the inlet pipes to be so arranged that the mixture from the carburettor has an equal distance to travel to each of the cylinders. The water circulation is maintained by a gear-driven centrifugal pump and a honeycomb radiator, a current of air being drawn through the latter by means of a fan formed in the flywheel. The clutch is of the multiple-disc type, and the change-speed gear, which is adapted to give four speeds and a reverse, is controlled by a lever working in a gate. On the top speed the drive is direct through the cardan shaft and bevel gear to a well-supported live axle. Ball bearings are, of course, employed to all parts, except the engine. Altogether the S.P.A. forms a noteworthy addition to the already long list of high-grade cars now being turned out in Italy.

The Stella Car.

A new car to this country is the Stella, made by LA COMPAGNIE DE L'INDUSTRIE ET MECANIQUE, of Secheron, Geneva, and exhibited on Messrs. Sayers and Co.'s stand by the Stella Motor Co., of Pall Mall, London, S.W. The one on view is a live axle vehicle of 16-20-h.p. The engine comprises four cylinders, cast in pairs (90 mm. bore by 120 mm. stroke), with the m.o.v. valves set on opposite sides. One of the most interesting features of the vehicle is the carburettor, which can not only be quickly detached, but is of the multi-jet type. There are altogether four jets, the small outlets in which vary in size; these are

Fig. 7.—The S.P.A. 60-h.p. Six-cylinder Motor.

made by LA SOCIETA' PIEMONTESE AUTOMOBILI ANSALDI-CEIRANO, of Turin, Italy, and the British agency for which has been secured by the S.P.A. Motor Co., of Riding House Street, London, W. Two sizes are on view, a 40-h.p. four-cylinder and a 60-h.p. six-cylinder, both having live axles. Except as concerns the number of cylinders, the two vehicles are identical as regards the details, so that the following particulars may be taken as applying to both. In the first place it may be men-

Fig. 8.—Plan of Chassis of Stella 16-20-h.p. Car.

so arranged that as the speed of the engine increases the supply of petrol to the vaporising chamber is rendered proportionate to the air. The main inlet for the latter is through holes in the body of the device at the side of the jets, while the additional supply is through an automatic valve below. The ignition is by low-tension magneto, the tappets being so arranged that they can be readily adjusted. The bottom half of the base chamber is so fitted that it can be detached without disturbing the crank shaft or its bearings, while the bracket for the support of the starting handle is an integral part of the motor. No mud-protecting shield of the usual pattern is employed, the base chamber being extended at the sides so as to serve the same purpose. The flywheel and clutch are also provided below with an aluminium shield, this being bolted at the forward end to the crank case. The change-speed gear is

gate-controlled, and gives a direct drive on the top third speed. The final drive is by a cardan shaft bevel gear to a rear live axle. A useful feature of the sleeve surrounding the latter, and of the differential casing, is the plane surface, any necessary webs being inside; thus there are no corners in which mud and dirt can collect, a point which was brought out in Mr. J. L. Martineau's recent paper on "Accessibility and Cleanliness." Very long dumb irons are provided at the rear, which enables springs of good length to be fitted. The clips which connect the springs to the axle casing are not rigidly fitted to the latter, but are free to move to a slight extent to allow for any variation in the relative position of the two parts.

The All-British Eight-cylinder Motor.

One of the most novel petrol motors in the Show is that exhibited on the stand of the ALL-BRITISH CAR COMPANY, of Bridgeton, Glasgow. It is made in accordance with the designs of Mr. G. Johnston, the managing director of the concern, who was responsible for the invention of the original Arrol-Johnston horizontal engine. As will be seen from Fig. 10 it comprises eight vertical cylinders arranged in pairs, four on each side of the centre line of the crank shaft. It is claimed that by reason of this novel arrangement for a given horse-power the space occupied by the engine can be curtailed by 40 per cent., while at the same time a perfect balance and torque are obtained, and the side thrust, with consequent friction and wear of the pistons on the cylinders, reduced to a minimum. Reference to Fig. 9 will show that the piston-rods are not connected directly to the crank shaft but to one end of a rocking arm, the piston-rod of the corresponding cylinder on the opposite side being connected to the other end of the rocker, which imparts a rotary motion to the crank shaft through the main connecting rods, of which there is one for each pair of cylinders. The inlet valves, which are located in the cylinder heads, are of a special type. At slow engine speeds they open

Fig. 9.—Sectional View of the All-British Eight-Cylinder Engine.

automatically, but when the speed of the motor exceeds 1,000 revolutions per minute they are mechanically actuated, the action being assisted by a light diaphragm plate of large area, which moves with the valve, and fits into a seat at the top of the valve case. Two ignitions are provided—coil and accumulators and low tension magneto. The latter is located above the flywheel and operated directly off the fan spindle, which is carried centrally, and between the upper part of the two groups of cylinders. Two carburettors are employed, each furnishing the mixture for four cylinders. Another feature of the design is the governor, which is connected up to both the throttle and the ignition, which latter is consequently automatically advanced and retarded. The design of the cam shafts is on novel lines, the cams being provided with clutches by means of which it is possible to cut out the valve action of any or all of the pairs of cylinders. The engine can thus be controlled by three separate methods:—By cutting out the valve motion of any two cylinders, the pistons of which are moving simultaneously in the same direction. These pistons, on their up-stroke, compress a full charge of air in both their respective cylinders, which compression absorbs one half the power given off in the down-stroke working cylinder. The power thus stored in the compressed charge by the two pistons is given off on their return stroke, and thus a perfectly even torque is ensured, even with only two cylinders working out of eight. By this method of control only the number of cylinders required for the work to be done at the time are in use, the others being held in reserve, and balancing the torque as explained. As the full compression is maintained in the cylinders which are working, the maximum efficiency of the petrol used is always obtained, and a saving of from 20 per cent. to 50 per cent. is claimed to be effected over the

usual methods of governing. The second method of control is by means of a special throttle on the admission, and the third by the governor, which, operating in the usual way, can be set to give any desired engine speed. The motor is fitted with ball bearings to crank and cam shafts and to the governor and fan. Unusually large inspection doors are provided in the base chamber. The All-British Company also exhibit a chassis fitted with one of the eight-cylinder engines and a special epicyclic change-speed gear, reference to which we must reserve until a later issue.

Fig. 10.—The All-British Eight-cylinder Engine.

The Ruppe Light Car.

A light two-seated car of German construction, known as the Ruppe, is shown by Messrs. KURTNER, MACDONELL AND COOKSON, LTD., of Endell Street, London, W.C. The engine, which is of 8-h.p., comprises two air-cooled cylinders set at an angle in the form of a V. They are air-cooled, being provided with heat radiating fins, with an air ventilating fan both at the front and the rear. The valves are mechanically

Fig. 11.—The Ruppe 8-h.p. Phaeton.

operated, and the ignition is by accumulators. The change-speed gear gives three speeds forward and a reverse. The control is effected by a lever under the steering wheel and the clutch is worked by pedal. Power is transmitted from the gear-box to the differential by a cardan shaft. All gear wheels operate in oil and the rear axle runs on ball bearings. The light weight of the car, approximately 7 cwt. complete, reduces the wear and tear to a minimum, the petrol consumption being also correspondingly low.

The "Roydale" Cars.

One of the great features of the Show is the appearance of the new all-British car built by the ROYDALE ENGINEERING COMPANY, Huddersfield, to the designs of Mr. Chas. Binks. The vehicles on view are all of the same power, 18-22-h.p., and comprise a chassis and two excellently finished side entrance double phaetons. The engine and gear-box are carried on a sub-frame, the main pressed steel frame being narrowed at the front to increase the lock of the steering wheels. The

Fig. 12.—The Roydale 18-22-h.p. Motor with all Four Cylinders cast in one piece.

engine, which comprises four cylinders cast in one piece, is exceedingly compact. The valves are all mechanically operated and are located on opposite sides; the mixture is furnished by the Binks automatic carburettor, a feature of which is a choke tube, by means of which it is claimed to be possible to run the vehicle at any speed from five to forty-seven miles per hour on the top direct speed without declutching. There is only one inlet and one exhaust pipe, these being bolted up to distribution chambers in the cylinder casting, the valve stems and springs

Fig. 13.—View of Clutch, Gear-box and Footbrake of Roydale 18-22-h.p. Car.

being thus rendered most accessible. The lubrication of the engine is maintained by the pressure of the exhaust. The oil is fed up to the top of the dashboard, where it can be seen dropping in a dome-shaped glass, and if by any reason the latter becomes discoloured or splashed with oil it can be screwed out and cleaned with a cloth in a moment. The water circulation is effected by a pump; it is, however, so arranged that should anything go wrong with the latter the water will still flow on the thermo-syphon principle. The radiator is of the honeycomb

type of the Roydale Company's own design, an air-inducing fan being formed on the periphery of the flywheel. Two systems of high tension ignition—magneto and accumulators—are provided. The throttle valve is operated by a lever on the steering wheel and also by the clutch pedal, so that as the clutch is withdrawn the speed of the motor is automatically cut down. The clutch is of the leather-faced cone type, and the gear-box, which is adapted to give three speeds and a reverse, is provided with roller bearings. The final transmission is by a cardan shaft and bevel gear to a well-designed live axle, which has only the driving strain to withstand, the road wheels being carried on the axle casing, the power being transmitted to the wheels by jaw clutches in the hubs. Two foot brakes are provided, one working internally and the other externally on a large drum at the rear of the gear-box, the usual internally expanding brakes in connection with the hubs of the rear road wheels, and operated by a hand lever, being also provided. The dashboard and footboard is of a pleasing design. The petrol tank is located below the latter, and has a capacity of eight gallons. On the dash are mounted a gauge showing the amount of spirit in the tank, and a similar gauge indicating the amount of oil supply. One of the finished cars exhibited has a novel receptacle at the rear of the body, in which four suit cases stood. In the other car a loose floor is provided, lifting up which discloses a box in which a spare tyre can be kept. Altogether the Roydales form a noteworthy addition to the list of British-built cars, the details all bearing indication of having been carefully thought out, while only the highest grade of material is employed in the construction. A new detachable rim is also to be seen at this stand, by means of which a damaged tyre can be removed and a fully-inflated tyre fixed in position in two minutes. The damaged

Fig. 14.—The Aries 30-35-h.p. Berline.

cover can be readily detached from the loose rim and a new cover put on without difficulty, by means of a screw arrangement which contracts the rim.

The Aries Cars.

The British agency for the Aries cars is now in the hands of the AUTOMOBILES DE LUXE, LTD. (West End Agency), who are exhibiting examples of the 30-35-h.p. and 24-30-h.p. models, including the luxuriously finished berline shown above in Fig. 14. The chassis we examined was of the 30-35-h.p. type. The engine comprises four separate cylinders, 120 mm. bore by 140 mm. stroke, with mechanically-operated inlet valves and automatic carburettor, the extra air inlet being controlled hydraulically by a branch off the water circulation system. The lower half of the base chamber is so arranged that it can be detached without disturbing the crank-shaft, which latter has a bearing between each throw. Two systems of ignition are provided, accumulators and magneto. The clutch is of the metal-to-metal disc type and the transmission is by cardan shaft and bevel gear on to a live axle. The latter is of special design, a fixed axle being provided below it to support the differential case and render it rigid. The shafts from each side of the differential run through the hollow ends of the dropped fixed axle, on which the road wheels are mounted on balls, the drive to the wheels being through a star dog clutch on the end of the live shafts. The differential shaft has thus only to transmit the power without carrying any of the weight of the car.

Messrs. BAEDER, ADAMSON AND COMPANY have a collection of miscellaneous goods for the motor industry, including horsehair for the upholstery work of cars.

ELECTRICAL VEHICLES.

The Scheele Electrical Carriages.

The SCHEELE ELECTRIC CARRIAGE COMPANY, of Grosvenor Mews, New Bond Street, London, W., display a trio of the Scheele electric cars, including a brougham, a landaulet, and a limousine; the latter is an exceedingly luxuriously-furnished vehicle, having accommodation for seven persons inside. Outwardly it closely resembles a petrol car, the battery being carried under a bonnet in the front part of the car, and the controller operated by a side lever. The electrical energy in the limousine is furnished by a battery of 46 Hagen accumulators of a capacity

Fig. 15.—The Scheele Eight-Seated Electric Limousine.

260 ampere-hours, this being stated to be capable of running the car a distance on one charge of about sixty miles, at a speed of from eighteen to twenty miles per hour. The controller is adapted to give five forward speeds, two electric braking positions and two reverse speeds, a feature of the Scheele system being that the various speeds are obtained, not in the usual way by varying the accumulator grouping, but by means of the motors, of which two—of the series type—are employed, they being supported from the rear axle and driving, through spur pinions, crown wheels connected with the hubs on the rear road wheels. The various combinations given by the controller are:—First speed, the resistances, fields and armatures are in series; the second speed is obtained without the resistances and with the armatures and fields in series; for the third speed the fields are in series and the armatures in parallel; for the fourth speed both motors are in parallel; while for the fifth or top speed the resistances and fields are in parallel and the armatures in series. The broughams and landaulets are on similar lines except that the battery is carried under the driver's seat, and that the controller is operated by a small lever below the steering wheel.

The Electric Vehicles Development Company's Exhibit.

Several broughams and landaulets on the Vedrine system are displayed by the ELECTRIC VEHICLES DEVELOPMENT COMPANY, LTD., of Market Street, Edgware Road, London, W., the feature being that the various speeds and reverse motions are obtained not by altering the accumulator connections but by varying the magnetic field in the single electric motor employed. The latter is located at the rear of the vehicle and drives the live axle through spur gearing and a differential. It is of the enclosed four-pole compound-wound type and is radially supported on the live rear axle, its weight and the driving efforts being taken in front of the back axle by transverse laminated and coil springs. The electrical connections between the battery, motor field and armature, and the regulating resistances, are simple, there being only two conductors, one of these being attached to one of the brushes and the other passing by the series exciting winding of the motor to the other brush inside. The motor, which has a patented improved field magnet yoke, converts into mechanical energy a mean power of 4,250 watts with an E.M.F. of 85 volts, and an efficiency of 95 per cent. Its speed under full load may be varied from 550 to 1,600 revolutions per minute, by simply varying the shunt-exciting current from 2.5 amperes to 0. When the exciting current is zero, there still remains a certain number of ampere turns supplied by a series winding, which is sufficient of itself to ensure the working of the motor at high speed. A simple pedal-operated starting switch is used to regulate and finally cut out resistances in series with the armature of the motor, and a reversing switch, also operated by pedal, for effecting the necessary change of motor connections for the reverse direction of running. These

switches are only required for starting and reversing, and are consequently generally out of use, the variations in the speed being obtained by acting solely on the shunt exciting circuit of the motor, that is to say by introducing resistances into this circuit. For this purpose the steering wheel is provided with a handle moving over a circular rack. This lever operates the exciting rheostat located at the lower part of the steering pillar on the frame. The mechanical operation of the rheostat is effected by a steel cord carried down to the frame through the interior of the steering column, and attached at its lower end to the device for operating the rheostat, composed of a part capable of moving round a shaft and carrying on one side the brushes, which run over a suitable number of contacts connected to the resistances, and on the other side carrying a sector with an eye to which the steel cord is connected. A simple safety arrangement makes it impossible to depress the starting pedal so long as the accelerating handle has not been returned to its "rest" position. Another safety arrangement consists in the automatic disengagement of the forward running pedal, which serves as a current interrupting device, as soon as pressure is exerted either upon the reverse motion pedal or upon the brake pedal. This method of speed regulation by varying the field strength of the motor provides the means of restarting the carriage either gradually or quietly, as may be necessary, without requiring the use of the mechanical brakes except for abrupt stops or when descending severe gradients. A feature of the motor is its ability to endure heavy overloads; in fact, it is claimed to be possible to double the normal power without danger of damage. The battery, which weighs about 500 kilogs., has a capacity of 130 ampere hours, sufficient to run the vehicle a distance of fifty miles on one charge. It is claimed that by dispensing with all coupling of the accumulators the life of the latter is increased, while the operations of starting, changing speed, and stopping are performed without jerk, the change taking place progressively. The frame of the vehicle is of a specially curved design, which brings the floor at the point where the entrance door is located 15 in. from the ground, thus affording easy and comfortable egress to the car, which complete weighs about 32 cwt. Among the advantages which the Electrical Vehicles Development Company, Ltd., claim for their carriages are low consumption of electric power, which enables them to perform with batteries of less capacity and weight than those generally used, and smoothness of running, stopping, and re-starting. We may add that one of these carriages was recently driven from London to Brighton on a single charge in 3 h. 52 min., the average speed working out at about thirteen and a half miles per hour, the battery in this case having a capacity of 137 ampere hours, and eighty two volts.

An Electrical Motor Delivery Van.

The IMPROVED ELECTRIC TRACTION COMPANY, LTD., London, S.W., exhibit a 2-ton electric delivery lorry stated to be capable of conveying its load at a speed of twelve miles per hour and of running forty miles on one charge of the battery, which is hung

Fig. 16.—The Electric Vehicles Development Company's Landaulet.

below the main frame. A single electric motor is employed, this driving, through spur gearing, a differential shaft, from which the power is conveyed to the rear road wheels by side chains. The vehicle is, we may add, of American construction. This company are also expecting a novel vehicle in the shape of an electrical motor-bus with all four wheels driven, but this had not arrived at the time of our visit to the stand.

HEAVY STEAM VEHICLES.

The Foden Steam Wagons.

Messrs. FODENS, LIMITED, are present with a couple of their standard heavy steam vehicles, intended for general hauling purposes for loads up to 5 tons (Fig. 17). In general appearance the wagons, which are built to comply with the Local Government Board regulations, take the form of a small traction engine, behind which is mounted a platform upon which the load is carried. The boiler, which is of the horizontal multitubular type, forms the front part of the framework. The sides of the frame are constructed of channel steel tied and braced together in such a manner as to secure great strength in the complete lorry. The

Fig. 17.—The Foden Steam Wagon.

boiler can be fired with coke, coal, or wood. The wagon is driven by a compound steam-engine fixed on the top of the boiler. The cylinders are fitted with high-pressure gear, by means of which both can, in case of emergency, receive live steam from the boiler, and each cylinder exhaust independently into the chimney. The power is transmitted by spur wheels to the compensating gear shaft, and thence to the rear axle by an extra strong Renold roller chain. The gearing is arranged for two speeds. The Foden wagons are among the most popular with users of this type of vehicle, among the orders recently secured being several for the London County Council.

The St. Pancras Steam Wagon.

The ST. PANCRAS IRON WORK COMPANY, LIMITED, are present with two examples of the St. Pancras 5-ton steam wagons, in which a number of interesting features are incorporated. The boiler is of the fire-tube vertical type, fitted with horizontal tubes. There is a large central fire-box fired from the top through a central shoot, and at the bottom of the shoot is a baffle plate riveted to the fire-box plate, which completely cuts off the upper part of the central space from the fire-box. The products of combustion pass outwards through the lower eight rows of tubes to

Fig. 18.—The Yorkshire 6-ton Steam Wagon.

an annular smoke-box, and are returned inwards through the upper rows of tubes to the central space above the baffle plate, from whence they rise to the funnel. The water level is well above the top row of tubes, even on a considerable incline. Advantage is taken of the position of the baffle plate to make it into an exhaust steam superheater, from which the exhaust is finally emitted through a nozzle in the base of the funnel. The casing or annular smoke-box is provided with doors, so that all the tubes can be properly swept, and the top cover plate of the boiler can be unbolted to clean the outside of the tubes. The working pressure is 220 lbs. per sq. in., and the heating surface 92 sq. ft. The engine is of the horizontal compound type, the cylinders

being $4\frac{1}{2}$ in. and 7 in. in diameter by 6 in. stroke. It is fitted with link motion actuating D slide valves. There is a central bearing to the crank shaft, all the bearings being lined with phosphor bronze brushes. A recent improvement is seen in an intercepting valve, which allows both cylinders to receive steam direct from the boiler. The power is transmitted by spur gearing to the countershaft and thence to the back wheels by roller chains, the latter being provided with mud-protecting covers. One special feature of the St. Pancras wagon is the patent fore-carriage. This gives a three-point suspension on the road, and permits either of the leading wheels to surmount large obstacles without distorting the main frame.

The Yorkshire Steam Wagon.

The YORKSHIRE PATENT STEAM WAGON CO., of Hunslet, Leeds, had intended to exhibit a new steam motor-bus chassis, but, unfortunately, were not able to complete it in time for the show. Their display is consequently confined to one of their 6-ton steam wagons, of which a considerable number are now in use in different parts of the country. Since last year several modifications have been introduced, notably the adoption of vertical engines in place of the horizontal type, and chain transmission in place of the former gear drive. The boiler is of the company's patent cylindrical type, placed transversely across the front of the frame. The engine, which is located to the rear of the driver, is of the vertical compound type, the cylinders being $4\frac{1}{2}$ in. and 7 in. in diameter, with a stroke of $7\frac{1}{2}$ in. The right-hand end of the crank shaft is provided with a heavy flywheel, and an auxiliary valve enables high-pressure steam to be admitted to both cylinders, to give additional power when starting the wagon on a hill, or on soft

Fig. 19.—The Drummond 6-in. self-acting, sliding, boring, surfacing, and screw-cutting lathe. (See page 138.)

ground. Two speeds are provided by means of sliding pinions, the final drive being by a centrally-located Renold roller chain to the differential gearing on the back axle.

Office Requirements.

Much interest is being taken in the distinctive feature of the Oliver standard visible writer typewriter, as well as the typewriter supplies and hand duplicators of the OLIVER TYPEWRITER COMPANY, LTD. At another stand the BLICKENSDECKER COMPANY, LTD., made a good show of their typewriters, duplicators, and other apparatus for facilitating the work of the office.

MISCELLANEOUS EXHIBITS.

Machine Tools for Motor Repairers.

Messrs. DRUMMOND BROS., LIMITED, of Rydes Hill, Guildford, have an interesting display of their special lathes for the repairing of motors. Among others are three small 3½-inch self-acting boring, sliding and screw-cutting lathes, which have been designed with the view of enabling all usual light-running repairs to be readily carried out. This small tool is capable of very much heavier work than the ordinary lathe of this size; for instance, all the parts of a 3-h.p. cycle motor can, the makers inform us, be turned out by its means. The tool is supplied with either treadle or arranged for power operation, a bench pattern being also made. Two of the new design 5-inch heavy lathes, capable of making throughout the machinery of any ordinary car, are also to be seen, as well as a "Workman's" lathe (Fig. 19), designed for professional repair work, a small bench-shaping machine and an assortment of lathe chucks and accessories. Messrs. Drummond Brothers, Ltd., are devoting considerable attention to the production of special tools for motor repairing, the design of the same being the result of long and careful experiments on the work they are intended for.

The Palmer Tyres.

One of the most attractive displays in the exhibition is that of the PALMER TYRE, LTD., whose wonderful cord-laying machine has demonstrated the possibilities of mechanical work in a most emphatic way. By means of this machine the company have been enabled to so reorganise their establishment as to reduce the prices of their tyres, and so assist the automobile movement to a considerable degree. For experience has shown that the Palmer tyre is almost impervious to punctures, while being free from internal friction, heating and other troubles often regarded as inevitable. It is scarcely necessary to say that this tyre is on the cord principle, with the threads so arranged that the strains are direct. By the really unique method of manu-

Fig. 20.—The Palmer Cord-Laying Machine.

facture irregularities of workmanship are prevented, so that there are no slack threads and the tension on all the threads is uniform. Two layers are employed, one in each direction. Of course, the shape of the side walls will be altered by the tread making contact with the road, but the strength of the cord fabric is not reduced at the time when it is most required to transmit the driving power to the road. In securing this result the new cord-laying machine running in the exhibition, and illustrated in Fig. 20, plays its part. The "former," or that part of the machine on which the tyre is built, is provided with a row of anchoring pins on each side. The cord is folded into loops by a lever or arm, and placed across the "former" at the required angle at which the cords are to be laid in the finished tyre. The cord is led from the supply spool to a sensitive regulator designed to contain an ample supply of cord at a uniform tension, to be drawn upon as required. From the tension regulator the cord is led to a pulley, from which it passes to the "former," being folded and guided in its course by the folding arm. The latter delivers the cord to the "former" in the shape of two loops, one on each side, each loop being held out straight by two pins on the folding arm. Two transferring arms then come into operation and transfer the loops from the pins of the folding arm to one of the pins of the "former" on each side, at the same time laying the cord at its proper angle and curve on the "former." The folding arm then returns through a half revolution, takes up another length of cord, folds it into loops, and the operation is repeated until the whole circumference of the slowly revolving "former" is covered. Before leaving the folding arm the cord is held in position on the "former" by a pressure foot. The downward movement of the transferring arm causes the loops of cord to be placed over the pins on the "former." A number of guides and fingers come into operation during the last-mentioned movement, to give the cord the required quarter twist and place it in position on the "former." When one complete layer is placed on one "former" it is transferred to another machine for the purpose of applying the second layer of cord at the reverse angle, after which the rubber to form the tread is applied. A pair of these machines will place two layers of cord in ten minutes, an immense saving in labour that has enabled the makers to reduce the cost of the Palmer tyre. Moreover, by this machine a uniformity in tensions and angles is assured that could never have been expected with hand labour.

Rushmore Lamps.

From a coign of vantage in the Arcade the Rushmore Searchlight has been penetrating to the uttermost ends of the Hall and reminding us that the firm responsible for the Rushmore lamps, that have lately come into prominence on British automobiles seen in our streets, originally won renown in connection with marine work. The Lens

Mirror is the distinctive feature of these lamps, introduced here by the RUSHMORE LAMPS, LTD. To safely maintain high speed on a dark road it is necessary that the beam be shifted to see that the road is clear before reaching a curve. With the Rushmore Swing Light it is possible to maintain a speed of forty miles when examining the road past several corners; while with a fixed light it is necessary to slow down at curves, as the beam is then far off the road. Attempts have been made to swing the light by connecting it with the steering gear of the car, but this has been found impracticable, as at high speeds it is necessary to see across the curve before reaching it. The searchlight is mounted in a swinging frame with bracket for mounting on a flat vertical dashboard, special brackets being provided for any particular make of car requiring a special design. Mention might also be made of the company's generators; but description of their good points is reserved for a later issue.

Aluminium.

In his familiar stand at the entrance to the Arcade of the Hall, Mr. ROBERT W. COAN has a comprehensive exhibition of aluminium castings of every description for motor-car work. Mr. Coan is a practical worker in pure and hardened aluminium for turning and other purposes, and makes a feature of the repair of broken parts of aluminium. A novelty at his stand consists in the "Telephone Receiver Rest," an ingenious device for users of the telephone, which was recently described in our columns, and the exhibition of which at the Show is a matter of much public interest. This holds the receiver in position to the ear whilst speaking, leaving both hands free should it be desired to make notes.

Silencers.

The three silencers of SHARPE'S UNIVERSAL PATENTS COMPANY LTD., that won the first three prizes in the recent Auto-Cycle Club's Silencer Trials attract public attention at the stand of the makers, who naturally take pride in the fact that only one mark separated the three types of silencer from first prize taker. It will be remembered that the points considered by the judges in the competition were: 1, back pressure; 2, noise; 3, facility of attachment; 4, weight and strength; 5, capacity; 6, means of cleaning and maintenance and cost. The company also show their silencers for cars, which have now stood the test of four years' actual experience with results that have proved a growing appreciation on the part of motorists.

The Pegasus Specialities.

A good show of leather goods for motorists, including gaiters, motor tool bags, travelling cases, &c., is made by Messrs. MIDDLEMORE AND LAMPLUGH, LTD., whose specialities are distinguished by the trade name "Pegasus." This also serves for a non-skid of effective design, which also provides a good protection to the tyre. This consists of a strand of stout English leather of more than the usual thickness and specially prepared to withstand damp, while the surface next to the tyre is smoothed so that it cannot injure the rubber. The hardened steel studs provide an efficient surface to withstand any greasy roadways. Despite the stoutness of the leather, the whole device is very light, and, as it can be easily fitted in the minimum of time, the "Pegasus" non-skid should rapidly come to the front. The same firm have a gaiter of equally good form, which should prove useful in repairing cuts or tears in the outer covers.

Wheels.

A varied collection of artillery wheels for heavy and light motor-cars and commercial vehicles is shown by Messrs. SMITH, PARFREY AND CO., LTD., who have long specialised on such work as well as in axles and all classes of motor forgings. Bent timber is also exhibited by the firm, who can supply any description to special patterns or drawings. In their Pimlico wheel works the firm have introduced an electric welding plant with considerable satisfaction, and can ensure prompt delivery as well as good workmanship.

Lamps, &c.

The well-known Zanardini lamps from Italy are shown by Mr. C. F. BERTELLI, who is actively engaged in placing them upon the British market. The generator is manufactured on excellent lines, while the light, instead of being dispersed, is concentrated upon the road, as described in our columns at the time of the Stanley show. Mr. Bertelli is also identified with Oleoblitz, a high grade lubricating oil, tests of which have convinced the English agent of the character of the work of which it is capable.

Lubricating oils for every type of automobile are shown by the BOWRING PETROLEUM COMPANY, LTD., whose high-grade productions are well favoured by experts.

Messrs. A. F. HARDING AND COMPANY, LTD., are giving much attention to preparations for the revival of the worn leather and upholstery of motor-cars, the brightening of metal parts and similar cleaning operations which add to the appearance of vehicles on the road. A new liquid metal polish known by the descriptive name of "Osoesy" is shown, and we are able to speak well of its capacity to give an excellent finish with a minimum of labour. Another of the firm's preparations for removing dirt and grease from the leather of motor-cars, &c., is known as "Stainless." All the goods of Messrs. Harding and Company, Ltd., are distinguished by the trade-mark of "the fish and the ring," and characterised by good quality for the special purpose for which they are intended.

(To be continued.)

CORRESPONDENCE

[Letters to the Editor should be addressed to the office,
27-33, Charing Cross Road, W.C.]

POINTS ON THE ACTION OF A MAGNETO.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with great interest the valuable paper which Mr. W. Hibbert read before the Royal Automobile Club, on some points on the action of a magneto. As I have carried out a considerable amount of experimental work in connection with magneto-electric generators for ignition in internal combustion engines, some of the information gleaned from these might be of interest to your readers.

One set of experiments proved conclusively that ignition took place at the instant the contacts began to separate in the combustion chamber, proving that with the engine heated up to normal running conditions a most minute spark suffices to explode the charge. These experiments were carried out by means of a short circuiting device on a drum of large diameter, rotating with the crankshaft, the short circuit being arranged as a shunt across the terminals of the sparking plug. They also proved conclusively that there is no electrical lag in the case of a low-tension magneto, which,

couple of bearings. The weight added to the crankshaft is practically negligible.

I think that the figure of 5,300 lines per square centimetre for the induction in the magnets is somewhat low. I have frequently got over 7,000, and in one case 7,700. In conclusion, I would most heartily endorse Mr. Hibbert's remarks on the difficulty of making reliable brake tests. Undoubtedly by far the most satisfactory way is to have the engine under test directly connected to a continuous current dynamo whose constants are known.—Yours truly,

T. BLACKWOOD MURRAY.

TRAFFIC PROBLEMS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—The traffic in our streets, and the difficulty in adequately dealing with it, are steadily increasing, especially under the changed conditions consequent upon the introduction of mechanical traction. The absolute necessity of wider streets has been realised by the authorities, but in many cases the improvements which have been effected are almost neutralised by numerous obstructions placed in the centre of the road—lamp-posts, electric cable standards, cab-stands, &c. These have the effect of dividing a safe wide street into two dangerous narrow ones. The posts placed at cross-roads congest the traffic at the very places where most space is required, and make the crossings dangerous not only to vehicles (which frequently collide at these points) but also to foot passengers.

The blocks which occur every fine summer afternoon in Piccadilly, for instance (sometimes extending from the Circus to Hyde Park Corner) are mainly due to the lamp-posts and cab-rank at the eastern

Mrs. Veitch, of Edinburgh, on her Argyll Car. Dr. Veitch has used an Argyll for fourteen months with a total of only three hours' delays.

of course, is precisely what one would expect, as while the contacts are closed the current is rising in the armature circuit, and therefore there is a spark the moment the circuit is ruptured.

The popular fallacy as to the advantage of a hot spark is, I think, explained by the fact that it is extremely difficult to keep up a very high insulation standard in ignition circuits, particularly in the plugs, and therefore the more lively a magneto (or coil, as the case may be) one has to generate the igniting spark, the better margin one has to allow for leaky circuits, and therefore the more certain is regular ignition secured. A leakage across the spark gap either in low-tension or high-tension ignition has a most detrimental effect on the rapid rise of potential, which is essential to the formation of a satisfactory spark.

As to the power required to drive low-tension magnetos, careful tests showed that at a speed of 750 revolutions per minute, neglecting the friction losses, the power required to drive an ordinary Siemens H armature magneto was 13 watts (less than 1-50th of a horse-power) while generating the usual ignition current. Including the friction of the bearings, the power required was 28 watts (less than 1-25th of a horse-power). This magneto has a properly laminated armature. Magnetos with solid or partly solid armatures would, of course, be slightly less efficient.

I am glad that Mr. Hibbert has drawn attention to the positive and negative work done in rotating the magneto armature, and the consequent possible losses and noise due to backlash in the driving gear. This is one of the reasons which has led us in all Albion cars to fix the rotating part of the magneto rigidly to the crankshaft of the motor, and thus eliminating this loss and also frictional losses consequent on another

outlet. If these were removed there would be room for an additional row of traffic each way, which would probably be sufficient for ordinary requirements. In many cases the presence of these obstructions makes the correct observance of the rule of the road difficult, and in cases where the "two narrow dangerous roads" are monopolised by tramlines, (e.g. Ealing route) practically impossible. Most collisions appear to be due to the use of covered vans and buses the drivers of which are unable to obtain a view of traffic overtaking them on either side. The small windows or apertures fitted in the covers merely evade the principle of the bye-law which was expected to mitigate this evil.

There is an irritating lack of uniformity in the disposition of the gates in Hyde Park. The Stanhope gates are indicated IN, OUT, alternately; at Marble Arch, on the contrary, the arrangement is in pairs.

We have heard and read from time to time a good deal about the smoke nuisance, especially since the advent of motor-buses. One would have thought that the pungent odour from smoky exhausts would have been welcomed rather than otherwise, disguising as it does the sickening stench of putrefying offal which is always present where horse traffic abounds. It is most astonishing that such a disgusting nuisance and menace to health should be tolerated, considering how easily it might be entirely prevented.

The principal cause of skidding is, of course, the excessive curvature or camber of the road surface. The idea that this steep slope is necessary or desirable for drainage purposes is quite erroneous. In Hyde Park, for instance, the main road has in places a gradient of 1 in 9, descending 15 inches in 20 feet to the gutter. Driving a car out of this gutter is equivalent to making a standing start on the steepest part

of River Hill. A smooth, well-made road with a curvature of 1 in 100 would drain just as well, and, not being subject to the severe lateral abrading action occasioned by the tendency to skid, would last much longer. On these excessive cambers heavy vehicles with broad wheels are simply cutting into the surface with the edges of the tyres; the advantage of the broad tyre is to a large extent lost. Thus the worst holes and puddles are generally found on the roads with most camber. The effects of heavy rain remain on such surfaces much longer than on a flatter and therefore smoother road.

It appears to be a point of etiquette amongst horse-cab drivers to turn round in busy streets, without looking, as often and as suddenly as possible.

Much of the slight damage to vehicles is due to the foolish practice—encouraged often by the police—of running up so close to the preceding one. Many horses move backward when restarting, to the detriment of the head-lamps or wings of motor-cars following them. All horsed vehicles ought to be provided with sprocket sprags, making it impossible for the wheels to revolve backward unless the ratchet is released by the pedal operated by the driver. A forward locking device also would be a valuable safeguard against runaway horses.

Much of the congestion and difficulty so frequent in the fashionable shopping thoroughfares might be avoided by the simple expedient of compelling all vehicles to pull up on the left side only. In all circumstances the passage of the faster traffic would be greatly facilitated if all vehicles consistently kept as close to the left as possible.

The 28-h.p. Daimler recently supplied by Messrs. Henry Angus, Sanderson and Co., Newcastle-on-Tyne, to Sir Walter Runciman, Bart.

The body is an original design of the firm named, and it was, of course, manufactured by them. The body is made in such a manner that it can be opened right out; the canopy can also be made removable, although in this particular car the canopy and front pillars are a fixture. The car is capable of holding five in-side, three on the back seat, and there are two detachable revolving arm chairs fitted to the inside. It is luxuriously upholstered in grey French cord and is fitted up with canteens, cigar lighters, electric lights, &c.

There must be an appalling amount of time in the aggregate wasted in enquiring and searching for unknown streets, &c. All this could be avoided by simply adding to the present names numbers and letters according to the American system.

The suggestion has been made that certain main streets should be limited during part of the day to traffic travelling one way only. This method would probably be quite impracticable, as it would involve and confuse the traffic in the adjacent side streets, and continual congestion would arise from vehicles turning to and fro in the endeavour to find a through route available in the required direction. The only practical remedy for congested traffic is to widen streets where necessary, but the conditions may be greatly ameliorated by utilising the whole available area, instead of, as at present, restricting the use of one-third of the roadway by the presence of posts, cabs, and other obstructions. The Sheffield Corporation have recently realised the danger and inconvenience of central posts, and have removed the cable-standards from the centre of "The Moor," which is once again a reasonably safe and easy thoroughfare to traverse. When a similar reform is effected in London, virtually increasing by half the effective width of Piccadilly, Shaftesbury Avenue, &c., we shall be considerably nearer at least a partial solution of our ever-present and increasing traffic problems.—Yours truly,

ERNEST A. WADDY, M.I.A.E.

POLISHED CHASSIS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—There can be no doubt that the polished chassis at the Agricultural Hall this week have a strange fascination for many people who visit the Show, and it is not an exaggeration to say that some really believe that they can order such a chassis and use it on the road. The fact that the polish is merely put on as an attractive method of advertising the chassis does not at once appeal to them. They require a lot of convincing that nearly nine-tenths of all the parts they see so highly finished simply have a thick coat of paint or enamel on in the practical article sold to the public. There is much diversity of opinion amongst manufacturers as to whether results justify the great expenditure entailed in finishing off a chassis for show purposes. There is this to be said in its favour, however; that to the general public, who are only superficial observers, it brings home to them the fact that the modern motor-car is a splendid piece of mechanism, representing the highest level yet attained in engineering science. The practical motorist, of course, knows just what the true value of show finish is. He knows that he must look for good design, efficiency, and accurate workmanship, and that polish is the least of all considerations.—Yours truly,

PROVINCIAL VISITOR.

VARYING PETROL CONSUMPTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to "D 2104's" letter in your Correspondence columns on "Varying Petrol Consumption," it might interest him to know what my 8-h.p. De-Dion type of three speeds and reverse does in the way of petrol consumption. The best I have done is from Poole to Guildford, eighty-two miles, on two gallons and one pint with two persons and luggage which would be about equal to another one. I had a straight run, only stopping the engine once for lunch, and only used my lowest speed once or twice in the whole distance. The petrol used would have been a little less, but I had to run about Guildford to find my friends and the garage; this is where most of the low speed was used. This year I have done 436 miles on exactly fourteen gallons on petrol (Pratt's), thirty-one miles to the gallon. Most of this distance has been done in short journeys in a hilly district. It is a heavy car for the power, heavier than the recent De-Dion, 8-h.p. tonneau body. The car has been about 10,000 miles, and this week I thought I ought to see if new piston rings were required, as none had been put in since it was new in 1903. I found the top ring worn a bit but the other two hardly at all, the cylinder as good as the day it left the works, no play at all on the bearing. It seems almost impossible that it should be so after 10,000 miles, but it was so. It is wonderful what these cars will do, and for economy and reliability there is nothing like them, in my opinion.—Yours truly,

OWEN CARTER.

DETACHABLE MOTOR CARRIAGE BODIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A year ago I placed an order with the Windham Detachable Motor Body Company for a phaeton body to my 20-30-h.p. Renault chassis. This body embraced the "sliding principle," by which at very short notice a racing or other body can be substituted for the existing one. My friends rather tried to dissuade me from placing the order, contending that the principle was a new one, and that in use the body was sure to work loose and to rattle and shake more or less. I have now had my car nearly a year, during which time I have ridden it 9,176 miles, many of these on poor mountainous roads in Switzerland and Italy, and it is with much pleasure that I am able to testify that I have not had one moment's trouble from it, and that the body is now as sound and free from rattle as when I first acquired it. I am remitting to the firm the sum of £5 which I held as guarantee for the proper performance of the body, being perfectly satisfied with the work done. As I dare say your opinion has been solicited by intending purchasers, I thought it might be of use to you to have the opinion of a user and one who has no interest whatsoever in the company.—Yours truly,

CHARLES V. THOMSON.

A COMMERCIAL VEHICLE RUN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It was suggested at the lunch, and I have since been requested by several of the firms whose vehicles joined in the run to Ripley on the 10th ult., to organize another run on similar lines but on a much larger scale, on some date a few months hence, to be subsequently decided upon. I am very desirous of seeing the next one more representative of all the leading makes than was the last, and therefore propose the formation of a committee of management, composed of several of the makers themselves.

Properly organised, there is no reason why these runs should not become as much an annual event as, say, the cart horse parade of May 1st.

I shall be happy to receive at the Paul Street Works, Wolverhampton, names of those gentlemen desirous of joining the committee, and to assist as far as I possibly can to make the next and subsequent runs as successful as was the last.—Yours truly,

LEO HARRIS.

TESTS OF EXHAUST GASES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The tests which Mr. S. F. Edge has had carried out at the Northampton Institute on the exhaust gases from a six-cylinder Napier are of very great interest, as they show that such a large proportion, nearly 50 per cent., of the hydrocarbon (petrol) is wasted. But it is a question whether this proportion is not even greater than appears at first sight, because these tests only deal, I presume, with the constituents of the exhaust which were still in a gaseous condition at the time the analysis was made, and so no account has been taken of hydrocarbons that probably have condensed since the sample was drawn, and no mention is made of the water resulting from the oxidation of the hydrogen.

The proportion of nitrogen compared with that of the oxygen shows a remarkable discrepancy from the ratio in which they occur in the air. Neglecting the consideration of the small percentage of CO in the case of Sample A, the test actually accounts for 11.7 volumes (as the volume of oxygen in the CO₂ has the same volume as the CO₂ itself).

Then taking the formula for petrol to be roughly C₇H₁₆, the volumes of oxygen required to combine with the hydrogen (corresponding to 8.7 volumes of CO₂) would be 4.9, which brings our oxygen up to 16.6 volumes. The proportion of oxygen to nitrogen in air being approximately 1 to 4, we have to account for 20.4 volumes, and therefore there is a shortage of 3.8 volumes, and it is a question whether these have not gone to form oxidised compounds of the hydro-carbons, such as have not come within the consideration of the analyst as gaseous.

It would be very interesting if these discrepancies were cleared up, and I would suggest to Mr. Edge that he should undertake the determination of all the products of the combustion, not only those which remain gaseous. We all know that the petrol consumption of the six-cylinder Napier is good as compared with that of many other makes, and so we may presume that the loss on the average car is greater than indicated in this instance. At a time when petrol is so high in price it is of the utmost importance that such waste should not occur, and from some preliminary experiments which I have made I surmise that the trouble is due to the petrol not being equally and completely distributed throughout the air which carries it.—Yours truly,

A. DUCKHAM.

MOTOR-CAR EXPERIENCES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A short while ago I read in your Journal an enquiry as to experiences with a Rover car. I would like to say that on Good Friday, accompanied by another gentleman, I ran from Burnham to Portsmouth and Southsea, returning on Saturday via Southampton, Lyndhurst, Bournemouth and Wells, covering in all a distance of 240 miles. I used eight gallons of Pratt's motor spirit for the journey, thus averaging thirty miles to the gallon. My first run was to Salisbury, a distance of sixty-four miles; this I did on less than two gallons. I had not the slightest trouble of any kind with the car from start to finish, in fact, I did not have to touch it in any way. My car is an 8-h.p. four-seated Rover. I purchased it last August from the Bridgewater Motor Company, and I have driven it 3,000 miles in all weathers, and on all roads, as far north as Manchester, and I can speak most highly of its reliability and its hill-climbing powers, and can thoroughly recommend anyone wanting a small, but reliable and economical car, to purchase a Rover.—Yours truly,

THOMAS COX.

THE HEAVY TOURING CAR RACE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to a letter signed by me, which appeared recently in your esteemed Journal, the secretary of the Royal Automobile Club points out to me that I was incorrect in believing that it was necessary for the screen which is to be fitted on all cars in the Heavy Tourist Trophy to be of glass; on the contrary, it is to be of wood. I think it only fair to the secretary of the Club that you will permit me to publicly accept his correction; but, at the same time, the only difference that I can see is that the danger to the driver is changed from the danger of glass to the danger of splinters, or, in other words, I consider it a most dangerous practice to race with appliances of this description, or even with an ordinary tourist body, and that the method adopted by the Brookland track is far preferable.—Yours truly,

D. M. WEIGEL.

LUBRICATION TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a 12-h.p. two-cylinder Darracq, the engine of which is lubricated from crank chamber. I find one of my cylinders gets no lubrication. Can you or any of your readers advise me the best way of lubricating the cylinder independent of the lubrication of crank chamber?—Yours truly,

W. GRODON.

[This trouble is no doubt due to insufficient oil being admitted to the crank case, as both cylinders should be well lubricated if the rods were allowed to touch the oil. The only means of lubricating one cylinder without the other would be to drill and fit a lubricating pipe

in the cylinder below the water jacket. The pipe must be fitted with a small cheek valve near the cylinder to prevent the oil from being forced back into the lubricator. If, however, sufficient oil be admitted into the crank chamber we think the fitting of an extra pipe would be unnecessary.]

COURTESY (?).

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In a recent issue of the *M.C.J.* the matter of "Freemasonry amongst Motorists" was touched upon. Up to that time I had always found that motorists were most willing to render any assistance to one in a fix, but on Good Friday evening a 20-h.p. American car broke its chain about two and a half miles from the nearest garage. My employer kindly housed it for the night, and on the following day the owner came down with a man to repair the same, and asked me to help the man. This I did for about two and a half hours, leaving my own car, which I was preparing for the Easter holidays, and so causing me to work some hours later than I should otherwise have done. I may say the gentleman generously rewarded me with two sixpences. Should anything of the kind happen again I am afraid I should not be so willing to render assistance.—Yours truly,

FREEMASONRY.

WIRE OR WOODEN WHEELS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In the absence of further information we are entitled to regard the tests of Messrs. Kirkaldy as strictly comparable with those recently

Despatching Racing Cars from Marseilles to Messina, Sicily, for the Targa Florio Contest.

carried out in the Rudge-Whitworth laboratory. Messrs. Kirkaldy's tests show that, to be as strong, an Argyll staggered wheel must be 66 per cent. heavier than a Rudge-Whitworth wire wheel, the one weighing 35.36 lbs. and the other 21.25 lbs. The wire wheel offers less resistance to the air by reason of its thin spokes, and for the same reason whirls up less dust, which advantages should more than balance the aesthetic objections, which correspond to those raised a few years ago to pneumatic tyres on bicycles.—Yours truly,

JOHN V. PUGH.

PAINT FOR RENOVATING CAPE CART HOODS.—J. B. M. writes asking for the name of the makers of a paint or preparation for renovating canvas Cape cart hoods which have begun to fade and look shabby.

Mr. J. H. SUNTER, 15, Lord Street, Liverpool, has found a Salisbury tail lamp, evidently lost from a Lanchester car on Saturday, March 30th, between Capelcurig and Bettwa-y-coed. The owner can have the same on applying to Mr. Sunter.

IN reply to several inquiries we would mention that the address of Messrs. W. Whittaker and Co., the publishers of Mr. W. Hibbert's book, is 2, White Hart Street, Paternoster Square, London, E.C., and of Messrs. A. Constable and Co., who publish "O'Gorman's Motor Pocket Book," is 10, Orange Street, S.W.

INSPECTION PITS.—F. W. W. writes:—"Some time ago I had a catalogue from a firm advertising glazed fireclay motor pits. I have since mislaid the same, and cannot remember the name, and should be glad if any of your readers could supply me with the necessary information."

CLUBS AND ASSOCIATIONS.

ROYAL A.C.

THE sixteenth entry for the International Heavy Touring Car Race is Mr. J. S. Moyse's Thornycroft car. Entries for the International Isle of Man Races cannot be received after the end of this month.

The results of the analysis of the exhaust gases in connection with the Vapour Emission Competition have induced the judges to recommend that a further competition should be held in about a month's time.

A private enclosure for the stabling of the cars of members of the club during the four days' racing at Ascot (Tuesday, June 18th, to Friday, 21st) has been arranged.

THE LIVERPOOL MOTOR CLUB.

A COMMITTEE meeting of the Liverpool Automobile Club was held at the headquarters of the club, Exchange Hotel, Liverpool, on Monday afternoon. The assistant hon. secretary reported the visit of the sub-committee appointed to deal with the arrangements for the Motor Union meet at Southport, on July 20th. to Knowsley to meet the Hon. Arthur Stanley, M.P. An invitation from the Town Clerk of Southport to the

Capt. Deasy starting on his 1,000 Mile Trial in Ireland.

General Committee of the Motor Union to lunch with the Mayor and members of the Corporation after the committee meeting in the town hall on July 20th was cordially accepted on behalf of the Motor Union. The report of the sub-committee appointed to deal with facilitating the entries of cars of American visitors into the port of Liverpool was received, and arrangements in this respect are nearing completion. In order to encourage the motor industry in Liverpool, the committee has decided to offer a silver cup for the best motor-car built within the port of Liverpool, and subscriptions amounting to about £20 have been promised. A club meet has been arranged for April 27th at the Brine Baths Hotel, Nantwich, and an inter-club meet with the Manchester Automobile Club and other northern clubs at Buxton for June 29th.

LINCOLNSHIRE MOTOR CYCLE.

THE Lincolnshire Motor-Cycle Club, which has 250 members, opened the season with a members' hill climb at North Carlton, four miles north of Lincoln, and had a most decided success. Dr. Godfrey Lowe was judge, Mr. W. H. Smith starter, Mr. A. E. Kirkpatrick, N.C.U., and Mr. G. W. Robinson, N.C.U., were timekeepers, Mr. A. Nissler, clerk of the scales, and Mr. G. J. Wilkinson, hon. sec. The results were—

Class 1.—Up to 3½-h.p. (1) Rev. G. A. Grace, Besthorpe, 3½-h.p. four-cylinder F.N. Handicap figure 1011. Time 45 sec. Figure of merit 23.5. (2) F. Naylor, Lincoln, 3-h.p. N.S.U., 1020, 52½ sec., 20.4; (3) A. E. Brunning, Lincoln, 3½-h.p. Rover, 983, 50 sec., 20.

Class 2.—Over 3½-h.p. (1) J. A. Metham, Grantham, 4½-h.p. Mineiva. Handicap figure 729. Time 39 sec. Figure of merit 19.4; (2) H. Haagenen, junr., Grimsby, 5-h.p. Vindec, 810, 42 sec., 16.2; (3) F. Richardson, Lincoln, 5-h.p. Vindec, 15.9.

MOTOR CYCLING CLUB.

THE London to Edinburgh twenty-four hours' run of the Motor Cycling Club will take place on May 17th. This event is open to members of the club only, so that motor-cyclists who are not already members and who wish to take part in this event should communicate as soon as possible with the hon. secretary, Mr. A. Candler, 1, Lime Grove, Shepherd's Bush, W.

KENT.

DURING the present season the Kent Automobile Club will hold luncheons at Canterbury, Folkestone and Margate in connection with East Kent meets. The membership of the organisation is 119.

SCOTTISH A.C.

IN the absence of the Right Hon. Sir J. H. A. Macdonald, Lord Justice-Clerk of Scotland, Mr. H. M. Napier presided over the annual meeting of the Scottish A.C. in the North British Station Hotel, Edinburgh, last week. In moving the adoption of the report and balance-sheet he congratulated the members on the vitality of the club. It was only seven months since the Eastern and Western sections were consolidated, committees formed, and work begun. The increase of membership was very gratifying, there being now 765 members, an increase of 116 during seven months, and more were down for election. As to finance, they began with a balance in hand of £457 12s. 9d. The balance in hand now was £1,312 14s. 9d.

Mr. John Wilson, in seconding, also referred to the success of the club and the beneficial effect which the consolidation would have upon motoring. He would like very much if the club could make a start to have the roads improved. Round about Edinburgh during the past week or so the dust had been very bad. The office-bearers had been re-elected with the exception of two members of committee, whose places Mr. Wallace Fairweather, for the Glasgow District, and Mr. Hunter Crawford, for the Eastern District, were chosen to fill. A vote of thanks to the chairman concluded the proceedings.

With regard to the Club's Reliability Trial the committee notify the following amendment on Rule 57, which is now to read:—"No replenishing of water or fuel will be permitted at any of the luncheon stops or at other times without penalty except in the case of steam cars, which will be allowed five minutes before restart from each luncheon place for the replenishing of water."

The following additional entries have been received:—Thomas Shaw (Dundee), Ltd. (Siddley); Western Motor Company, Ltd. (Argyll cars); Walter Phillips (Coventry Humber); Buchanan Shiel (Mercedes); Adams Manufacturing Company, Ltd. (Adams Hewitt).

ON Saturday next the East Surrey A.C. will have a run to Hampton Court.

THE Essex Motor Club will have a penalty run to Clacton on the 21st inst.

MR. W. O. SPILLER has been elected chairman of the Society of Motor Omnibus Engineers.

THE Derby Club's participation in the inter-club meet at Ashby on the 27th inst. will constitute its opening run of the season.

THE Nottinghamshire A.C. has issued a neat programme of their summer events. It is of a size to go in the waistcoat pocket.

THE secretary of the Motor Yacht Club is compiling a register of motor yachts and boats, and asks us to assist by inviting owners and builders to send him particulars of any motor-boats they may own or have built.

MOTOR-CAR ACCIDENTS.

MR. R. C. LEHMANN, M.P., with his two young daughters and a niece, was returning after his holiday to Bourne End in his motor-car, and was about to descend Hedsor Hill, when the hand brake snapped. He endeavoured to stop the car with the foot brake, but was unsuccessful, and the car went down the hill at a great pace. Mr. Lehmann turned and ran his car into a bank by the side of the road. The ladies were thrown out, and the car turned completely over. The car was a light one, and, although Mr. Lehmann was pinned beneath the steering gear, he escaped serious injury. He was soon extricated, and was able to go home with his daughters and the niece, who were unhurt, though much frightened. The car was badly damaged.

MESSRS. STRAKER-SQUIRE, LTD., have just opened a large West-End depot at 75, Shaftesbury Avenue, W., where the latest models of the Straker-Squire car are on view.

THE London and Parisian Motor Company, Ltd., have removed from South Molton Street, W., to new show rooms at 87, Davis Street, Oxford Street, W.

THE STEPNEY SPARE MOTOR WHEEL, LTD., have opened works for the manufacture of the Stepney spare motor wheel in Germany at 18-19, Lindower Strasse, Berlin, under the management of Mr. W. Mertens, late of the Continental Tyre Company, Ltd., London. The output of the spare wheels at present is 1,250 per month, but, owing to the new extensions at the Llanelli works, the company will soon be in a position to turn them out at the rate of 2,000 per month.

CASES UNDER THE MOTOR CAR ACT.

EXCEEDING LEGAL LIMIT.

Oliver Stanton was accused at Marylebone of driving his motor-car in Avenue Road, St. John's Wood, at over twenty miles an hour, and failing to produce his licence when desired by the police. Defendant said his indicator registered only eight miles an hour. He told the officers he refused to show his licence to anyone of lower rank than an inspector. The police were very brusque, and looked like brigands. When they asked for his licence he refused to produce it because it had no stain upon it. Afterwards he met a high official from Scotland Yard, to whom he confessed with regret that he had fallen into a police trap. The high official then asked, "What did you do?" and he told him that having been caught in a trap himself he went to the top of the Avenue Road and warned every motorist who came along. Altogether he warned forty-two, and held them up, and they all went down the road like a funeral procession. Mr. Plowden said no other course was open to him than to impose a fine of 40s. on one summons and 10s. on the other, with costs.

Several motorists were fined at the Shoreham Petty Sessions on Thursday of last week, for exceeding the legal limit at Southwick.

The case against a Brighton motorist for leaving his motor-car unattended on the road at Shoreham has been dismissed.

A motorist from Worcester has been fined 10s. and costs at Gloucester for causing an obstruction with a motor-car in that city.

DANGEROUS DRIVING.

Hugh Jones, chauffeur to Prince Hatzfeldt, of Draycott Manor, near Chippenham, Wiltshire, was at Gloucester on Saturday summoned for

speed, which he eventually did, but did not do so from the notice given by the sergeant, which he at the moment looked upon as a salute from the sergeant to him as a magistrate. The chairman announced that the majority of the magistrates considered that neither of the charges had been proved, and both summonses should be dismissed. He himself felt it was his duty to state that various representations had been made by different parties as to the high rate of speed at which Lord Portarlington was in the habit of driving in congested districts in and about the town of Portarlington, and, although he had no personal feeling in the matter, he was bound to say that sooner or later something serious would happen if the speed was not abated.

NO LIGHT.

Arthur Scully, of the Royal Military College, Sandhurst, Camberley, has been summoned for riding a motor-bicycle at Horsham on March 23rd without a light, and, further, with failing to produce his licence on demand. Defendant admitted both offences. P.S. Paull gave evidence, saying that defendant told him his friend in advance had his licence. Defendant now stated that he had no licence. It was the first time he had been out on a motor-cycle, and this one he had borrowed. Superintendent Goldring asked for the full penalty to be imposed under the circumstances. In each case a fine of 40s. and costs was imposed, amounting in all to £4 11s.

NO LICENCE.

At Northampton, Cyril Durlacher was summoned for driving a motor-car through Fenny Stratford, on March 8th, having no red light, and, secondly, for at the same time and place not having his number plate illuminated. Fined 20s. and costs, 8s. 6d. in each case. Herbert Alfred Evans was also summoned on two charges, one for not having his number plate illuminated, and the second for driving without having a

The above striking illustration shows an interior view of the new Daimler erecting shop, which is claimed to be by far the largest shop in the British Motor Industry. The erection of this building was necessitated by the very large demand for Daimler Cars, the present production being now nearly double that of twelve months ago.

driving at a dangerous speed at Hucclecote, near Gloucester. It was stated that the car was going at forty-five miles an hour. P.C. Perkins said he tried to take the number, but could not on account of the dust. There was a vehicle on either side of the road, and the driver of one of them was nearly knocked over. The motor-car did not touch either vehicle, but it was a very near thing—a matter of inches. Dr. Carter, of Chippenham, who was in the car at the time, said that he had done a lot of motoring with Prince Hatzfeldt. The speed through the village of Hucclecote did not exceed fourteen miles an hour. Defendant and another chauffeur who was in the car corroborated. Defendant, who had been twice previously convicted under the Motor Car Act, having been fined on one occasion £10 and costs and on another £2 and costs, was now ordered to pay £20 and £1 11s. 8d. expenses, and his licence was endorsed.

Mr. R. Vesey Fitzgerald, R.M., presided at the Petty Sessions at Portarlington, when two summonses were brought against the Earl of Portarlington for furious driving in the neighbourhood as under:—(a) Driving his motor-car in the public highway on the 25th of March, and failing to stop when signalled to do so by the complainant holding up his hand; and (b) driving his motor-car at such a speed and in such a manner as was dangerous to the public. Sergeant Molloy, Kilmalogue, deposed that Lord Portarlington was driving at the rate of twenty-five to thirty miles an hour up the street of Kilmalogue. He held up his hand and said "Much too fast, my lord," but he could not say that Lord Portarlington reduced the speed at which he was travelling at the time.

Mr. Turpin, solicitor, who appeared for Lord Portarlington, said his client did not understand the signal as a warning to reduce his

licence in Fenny Stratford, on March 7th. Fined 20s. in the first case and 30s. in the second, with 8s. 6d. costs in each, or fourteen days.

INTERNATIONAL AUTO-CYCLE TOURIST TROPHY RACE.

IN order to encourage entries and to create additional interest in this event, the Committee of the Auto-Cycle Club have opened a fund to raise an amount of about £100 for the purpose of providing cash prizes of, say, £60, £30, and £10, to be awarded to the entrants of the winning machines in this race. The expenses of organising an event of this kind, and the cost of closing the road in the Isle of Man for the purpose, will be so heavy that the amount received for entry fees will be insufficient to provide cash prizes in addition. The Committee are, therefore, appealing for donations towards the fund in the hope that there will be a general encouragement of the club in its efforts to promote an event which must ultimately benefit the motor-cycle industry generally.

MESSRS. SMITH'S PATENTS, LTD., 256 and 258, Borough High Street, London, E.C., send a circular and list of their unpuncturable leather tread and non-skid. These are made for cars and voiturettes, and by a special process the firm claim to strengthen the beads of motor-covers when fitting their leather treads.

MR. H. WAYMOUTH PRANCE, A.I.E.E., who makes a speciality of examining and reporting upon second-hand cars, has for the convenience, and in deference to the wish of many of his clients, had the telephone installed in his consulting room at 39, Westbourne Gardens, W., the number being 3737 Western.

COMPANY NEWS.

NEW COMPANIES REGISTERED.

Vauxhall Motors.—£25,000. To adopt a sale agreement between the Vauxhall and West Hydraulic Engineering Company, Ltd. (vendors), of the first part, L. Walton of second, P. Kidner of third, J. Todhunter and W. Gardner of fourth, and Vauxhall Cottage Company, Ltd., of fifth, and the company of sixth, and two management agreements with said L. Walton and P. Kidner respectively, and to carry on the business of manufacturers of motors, &c. No initial public issue. First directors (not less than two nor more than five): P. Kidner and L. Walton (permanent managing directors) and W. Gardner. So long as the vendor company hold 5,000 of shares allotted to them under sale agreement, they may appoint a director, W. Gardner being first nominee.

Pretoria Engineering and Motor Works.—£500. To adopt an agreement with Mr. W. C. Davies for the acquisition of the business of a general and electrical engineer, automobile manufacturer and dealer, &c., carried on by him at Brownhill Road, Catford, S.E. No initial public issue. Registered without articles.

Irish Motor Touring Company, Ltd.—Capital, £1,500 in £1 shares, for the purpose of carrying on business of conveyance by motor-cars, motor-cabs, boats, omnibuses, carriages, vans, &c., of all descriptions of passengers and goods, and to organise trips and tours throughout Ireland. Registered offices, Haddington Road, Dublin.

Dreadnought Motor Cycle Company.—£36,000 (£1). To acquire from Mr. F. M. S. Lewin the benefit for the United Kingdom of an invention relating to the starting of engines worked by explosive gases.

COMPANY MEETINGS.

Edinburgh and District Motor Omnibus Company, Ltd.—A meeting of this company has been held to consider a proposal to sell the assets of the company to a new company to be formed. Mr. C. E. Hogg presided. Mr. Young took some legal objections, and a long discussion ensued. On the motion being put to the meeting, it was lost. Mr. Young then proposed that a committee should be appointed to investigate the affairs of the company. The Chairman said he would cordially welcome a committee of inquiry, but when he was about to put the proposed names to the meeting, Mr. Young said he desired that the committee should have power to appeal to the Court. The Chairman said he should most strongly object to the committee having power to plunge the company into liquidation at the cost of the shareholders generally. After further discussion, the Chairman said that so much hostility had been shown, and several of the committee appeared to enter upon their duties in such an unfriendly spirit, that he should refuse to put the resolution to the meeting, which he then declared was at an end.

TAR-SPREADING COMPETITIONS.

FULL details have already appeared in the *M.C.J.* with regard to the two competitions that are being conducted by the Roads Improvement Association on behalf of the Royal Automobile Club and Motor Union. The competitions are for:—

- (a) The best Tar-spreading Machine, and
- (b) The best Preparation of Tar for road purposes.

The following is a list of entrants:—

TAR-SPREADING MACHINE COMPETITION.

Thomas Aitken, County Buildings, Cupar, Fife.
 "Emulsifix," Ltd., 55, Cross Street, Manchester.
 "Tarmaciser," Ltd., 7, Victoria Street, London, S.W.
 "Tarpra," Ltd., 20, Victoria Street, London, S.W.
 Thwaite and Thorp, 29, Great George Street, Westminster, London, S.W.
 Johnston's Lassailly Patent Road Binder Co., 45, Parliament Street, S.W.

TAR PREPARATION COMPETITION.

A. I. Craig, c.o. Messrs. Wishart and Sanderson, 15, York Place, Edinburgh.
 R. S. Clare and Company, Ltd., Tar Distillers and Manufacturing Chemists, Liverpool.
 "Hahnite," 3-4, Great Winchester Street, E.C.
 Kay Brothers, Ltd., St. Petersgate Mills, Stockport.
 Tar (Patents) Solidifying and Distilling Company, Ltd., 15, Mansion House Chambers, London, E.C.
 T. G. Marriott, 328, Renfrew Street, Glasgow.
 Ermenite, Woodbank, Matlock Bank.
 Gas Light and Coke Company, London.

CONFERENCE ON ROAD-MAKING.

A CONFERENCE of road makers and road users is being arranged to be held at Olympia, Kensington, W., on the 19th inst., in connection with the "Surveyor's" Section of the International Building Trades' Exhibition. The following papers, previously circulated, will be discussed:—

- (1) What the State could do to Assist in the Road Question, by E. J. Lovegrove, borough engineer of Hornsey.
- (2) In What Way could Road Widening be Facilitated? By H. T. Wakelam, county surveyor of Middlesex.
- (3) What could be done to Reduce Skidding on City Road Surfaces, by J. W. Bradley, city engineer of Westminster.

(4) The Use of Tar in Road Construction, by A. Dryland, county surveyor of Wilts.

(5) How far Skidding is due to Road Surfaces—(a) Construction and Materials, by Douglas Mackenzie; (b) Cleansing, by E. Shrapnell Smith.

(6) Some Points of the Road-Bridge Problem, by H. Howard Humphreys, consulting engineer to the Army Council on Roads and Bridges.

(7) The Design of Modern Motor Vehicles in Relation to the Existing Roads, by Colonel R. E. Crompton, C.B., R.E.

(8) The Planning of Roads for the New Traffic, by Rees Jeffreys.

The joint secretaries of the conference are Messrs. Gibson Thompson, 24, Bride Lane, Fleet Street, E.C.; and Mr. Rees Jeffreys, 1, Albemarle Street, Piccadilly, W.

ROAD REPORTS.

WARRINGTON.—Loud complaints have been made at Warrington Rural Council about the re-appearance of dust clouds caused by motor-cars and damage to roads and crops. One member said that the motor traffic was causing the ceilings in houses to crack and break. The chairman said that if the Imperial Exchequer did not contribute to the upkeep of the roads the council would be justified in refusing to maintain them in good order and in allowing them to get in such a state that rapid traffic would be impossible.

EAST GRINSTEAD.—Being satisfied with the result of their experiment of tar-washing the roads to prevent dust, the East Grinstead Council are continuing the treatment this season. They have been disappointed that the East Sussex County Council do not yet look upon the system so favourably as they do, the local Council considering that further experiments are unnecessary. In East Grinstead in past seasons only the extremities of the town have been tar-washed, but now those living in the centre of the town, where are most of the business premises, wish to have the roads there similarly treated. One disadvantage of the treatment is the quantity of dust caused while the tar-washing is being carried out, the roads having to be perfectly dry. The benefit which follows, however, amply repays those near by for the temporary inconvenience.

PERTH.—In connection with the application which has been made to the Secretary for Scotland by the County Council of the county of Perth for closing of roads to and restriction of speed of motor vehicles on certain roads within the county, Mr. Alexander Stuart, Edinburgh, has been appointed commissioner to investigate the roads proposed to be affected. A public inquiry will be held in the courthouse, Perth, on Wednesday, 17th inst., and any automobilists who are interested in the roads involved are requested to communicate with the secretary of the Scottish Club, 59, St. Vincent Street, Glasgow.

BUSINESS NEWS.

OWING to the requirements of the London telephone service, the telephone numbers of the City depot of Messrs. Humber, Ltd., have been altered from 778, Holborn, to 5560 and 5561, Holborn.

MESSRS. DURHAM, CHURCHILL AND COMPANY, Sheffield, are building a 24-30-h.p. 2-ton lorry for the Newbottle Co-operative Society, of Fence Houses, co. Durham.

MR. SIDNEY GIRLING has recently written to the Elastes Company, Ltd., stating that he has now run his 20-28-h.p. Darracq car fitted with Elastes-filled tyres 5,000 miles, and finds this tyre-filling most satisfactory. He points out that his car has had particularly hard work, being used for demonstration purposes in all parts of the country.

AFTER many delays, Horch Motors, Ltd., are now installed in their new depot in Shaftesbury Avenue, W.C., and are displaying the latest models of the car which won the 1906 Herkomer Trophy. A fine 35-40-h.p. chassis and a show-finished 18-22-h.p. vehicle are being exhibited, and after Cordingley's Show the landaulet which is on view at the Agricultural Hall will also be installed.

FROM Messrs. S.F. Edge, Ltd., comes a copy of a booklet they have just issued entitled "The Press on the Six-cylinder Napier," which contains a number of extracts from recent articles published in the leading newspapers concerning the six-cylinder principle for powerful motor-cars, as introduced by Mr. Napier.

OF interest to motor traders is the new catalogue of motor components just issued by the Etablissements Malicot and Blin, of Aubervilliers (Seine), France. It gives full particulars of the various M.A.B. parts, including differentials, back axles, change-speed gear, steering gears, &c.

MR. CECIL H. LAMB, of the late firm of Messrs. Lamb Brothers and Garnett, has, we learn, joined Climax Motors, Ltd., and is now engaged in pushing the sale of the Climax cars.

WE learn that Mr. Batson is not now connected with the Lindsay Motor Manufacturing Company, Ltd., and that Mr. J. Clingoe has taken over the sole control of the business.

CONVINCED of the merit of things Scotch, Mr. L. W. Lanen, the Dutch agent for the Argyll cars, has adopted the Scottish national costume for his son, the little fellow in his novel rig-out being quite a feature of the Argyll stand at the recent motor show at The Hague.

LAST week a social gathering of the employees of the Humber works at Beeston was held to celebrate the opening of the new show rooms and despatch department. Mr. T. C. Pullinger presided, and upwards of 1,200 employees and their wives were present.

THE Motor-Car Journal.

VOL. IX.]

LONDON, SATURDAY, APRIL 20, 1907.

[No. 424.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

OUR reports of motor-car cases in the courts this week include reference to two canine tragedies which have happened in that part of Sussex of which Uckfield is the legal centre. One of the summonses was dismissed; the other resulted in conviction. The two cases afford an illustration of the different ways in which motorists look upon the feelings of other people, and should encourage considerate drivers in continuing a respect for pedestrians and those upon the highways. At the same time we would remind the organisations associated with motoring that the dog nuisance has not been mitigated in the least by the new regulations, and that they will have to give some heed to that annoyance and danger of the roads if they are to secure the safety of their members.

The 1908 Show.

BOOKINGS have already commenced for Cordingley's Motor Show of 1908, which will again be held at the Agricultural Hall, London, from March 21st to 28th. Despite the difficulties which were created by the holidays coming so near the date of the 1907 event, the Exhibition which closed on Saturday was a great success, and the exhibitors of delivery and pleasure cars alike were able to record good business done. The Press have also recognised the fact that orders were plentiful, while serious inquiries proved that Cordingley's Exhibition maintains its prestige as a selling exhibition. Fashionable visitors came in large numbers, and traders from all parts of the country attended to see the novelties, and, in many cases, to settle contracts and place orders. This experience was not confined to makers of cars, but the accessory and component firms were equally well satisfied with the character of the inquiries and the extent of the orders received. Facts such as these will weigh with exhibitors, who are naturally anxious to take advantage of the choice of position always available to the early comers at the Agricultural Hall Show. And, as we have already said, booking has begun.

An Automobile Re-union.

THERE was a pleasant and informal gathering of members of the Automobile Association at the Exhibition in the Agricultural Hall on Thursday of last week. Many members who had come up to town to see the Show took advantage of the opportunity to meet their brethren and to discuss the affairs of the Association. The chair was occupied by Col. Bosworth, who was supported by Mr. Charles Temperley, Mr. L. Schlentheim, Captain Benett Stanford and other members of the Association. There was no speech-making in the ordinary sense of the word, but Col. Bosworth referred to the very prosperous condition of the Association, which had gone on increasing in membership by leaps and bounds. The result was that the good work of patrolling the roads had been vastly extended, and a complete system of agencies had been established all over the country, so that the A.A. was now represented in nearly every town and village. Guides had also been organised to lead members through the crooked streets of

the larger towns. Another new feature was the establishment of a legal insurance department, which would defend members' cases in any part of the country for a nominal annual fee. In conclusion, the chairman referred briefly to the conduct of the Motor Union in adopting a badge almost similar to that of the A.A. He counselled members, however much they might disapprove of this conduct, to use moderation. The Association will shortly move to very commodious new premises in the West End, where every accommodation will be provided for visiting members.

A Typical Saturday.

THE open air season is now getting into full swing, and motor club life is reviving after its winter rest. From now till the end of September the motorist will have plenty of entertainment, and the programmes of the clubs that have reached us thus far show a keen desire on the part of the officials to give members variety of amusement, as well as opportunity of comparing notes on the road—a very useful means of automobile education. Saturday, April 20th, may be regarded as a typical day, and the events that are crowded into the week end are illustrative of our meaning. Opening runs are being held by the Yorkshire A.C. to Harrogate, and the Southern M.C. to Epsom. The Motor Cycling Club will have its hill climb on Pebble Hill, near Westerham, and the Newcastle M.C. its slow hill climb on Benton Bank. At Reading the annual meeting of the Berkshire A.C. will take place; the West Surrey A.C. will indulge in its annual lunch at Hindhead; and the Royal A.C. will settle down to a serious examination of candidates for its certificates at the University College, Birmingham. Ordinary runs will also be undertaken by the Birmingham M.C.C. to Dodden Hill, the West Essex A.C. to Billericay, the East Surrey A.C. to Hampton Court, the Essex M.C. to Ongar, the New Forest and Bournemouth A.C. to Brockenhurst, and the Walthamstow M.C. to Quendon. Some of these trips will be continued over Sunday, when the Kensington A.C. will have its inaugural meet of the season at Frensham Ponds.

Benzole v. Petrol.

SOME degree of comfort may be gleaned from the evidence of Mr. Edmond Ledoux before the Fuels Committee of the Motor Union. Mr. Ledoux is the technical director of the Simon-Carves Bye-Product Coke-Oven Construction and Working Company, Ltd., and believes that if the demand for benzole were sufficiently great twenty-five to thirty million gallons could be recovered from coke-ovens and tar works. In fact, a third of that supply could be secured within a tolerably short time at 6d. per gallon at the works. If it was intended for use with motor-wagons, Mr. Ledoux believes that this 6d. unwashed benzole would be quite good enough, but if for pleasure and touring vehicles the further treatment that would be necessary might advance the price another penny. In confirmation of the suitability of this fuel he told the committee that he was using 65 per cent. unwashed benzole in his 16-h.p. De Dietrich, and found very good results so far as efficiency is concerned. He could travel 20 per cent. farther on the same quantity of fuel and could obtain perceptibly more power. He could start easily from cold, and the running was very smooth.

There was a certain amount of soot on the valves after running fifty miles in a hilly district, but not sufficient to cause trouble. The most serious drawback in the unwashed state was the smell. By further treatment, which could be done at an extra cost of, say, 1d. per gallon, all tendencies to sooting could be eliminated as well as the removal of the smell in the liquid state. Owing to the greater specific gravity of benzole the adjustment became automatic, *i.e.*, a less quantity of this liquid was admitted in the carburettor, consequently increasing the proportion of air in the mixture. Mr. Ledoux intends to use benzole on his car in the future.

Side-Slip and Skid Prevention Competition, 1907.

By a minute of November 7th, 1906, the Committee of the Royal A.C. authorised a competition for devices to prevent side-slip by motor-omnibuses, and announced that a cash prize of £100 would be given to the device which should prove efficient and receive the approval of the Chief Commissioner of Police and the Local Government Board. Forty-one devices were submitted in connection with this competition, of which number thirteen remained after the examination of the drawings, seven were submitted to a preliminary test on a prepared surface at the Clement-Talbot Works, Ladbroke Grove, N. Kensington, W., after which five were selected for the Road Endurance Test over a distance of 1,000 miles. The Road Test

Two of the Wolseley Vans which have lately been put in service by the Scotland Yard Authorities.

consisted of runs under service conditions on the Putney to Shoreditch route. The weather and road conditions were too good to provide a sufficient test of the side-slipping and non-skidding preventive qualities of the devices submitted. There were, however, two days on which the conditions were severe. The judges regret that no device submitted to or tested by them can claim to "efficiently prevent side-slip and skidding by motor-omnibuses" under all the varying conditions of street traffic. The Hartridge Tyre (rubber blocks, multi-sectional in direction of rotation), however, showed itself to be a practical device capable of application to existing road vehicles, and to be worthy of special commendation. Consequently, the judges recommend that a certificate be awarded to the Hartridge Tyre Syndicate, Ltd., and that the cash prize of £100 offered by the Club be also awarded to the company. The device submitted by Mr. H. B. Molesworth (three pairs of wheels, back and front steering) was presented in a condition which did not and could not do justice to the device; the judges are of opinion that even as presented it proved that the use of six wheels possesses distinct advantages in the prevention of side-slip, though as fitted and presented for trial the adhesion was so reduced as to result in a serious loss of driving and of brake power. The judges therefore recommend that a certificate of merit be awarded to the device entered by Mr. H. B. Molesworth.

The Dimensional Theory.

THE lecture which Mr. F. W. Lanchester delivered to the members of the Institution of Automobile Engineers last week at the Institution of Mechanical Engineers, Strrey's Gate, St. James's Park, under the Presidency of Colonel R. E. Crompton, on the horse-power of the petrol motor in its relation to bore, stroke and weight, was the most erudite paper which has yet been placed before that newly-formed body of experts. Briefly, Mr. Lanchester based his argument on the dimensional theory, concerning which he said that it had for many years been a surprise to him how little of the theory of dimensions was known, much less employed, by engineers, and if his lecture could bring it home to some few present that there was a valuable tool lying idle that was worthy of frequent employment his time would not have been wasted. The neglect of the dimensional theory seemed the more inexplicable when it was borne in mind how in other matters discovery and method were taken red hot from the physical laboratory and adapted post-haste by the modern engineer to meet the insatiable demands of western civilisation. The theory of dimensions might be said to be founded on the very simple and obvious fact that a time could never be equal to a volume or space, or an area to a linear quantity, or in general one physical quantity to another involving different fundamental qualities. The question of what constituted a fundamental quantity touched on the ultimate definition of our conceptions, but it was customary to recognise three fundamental quantities and three only, namely, length, mass, and time, into which all other physical quantities could be dissolved. The lecturer then dealt with the question of geometrical similarity in bodies of varying size, and went on to point out that if two machines, such as petrol motors, were built part for part alike, but differing in scale, their weights would be as their respective linear measurements cubed. He then dealt with horse-power as a function of linear dimension, immediate deductions from horse-power equation for engines of similar form, conditions of least weight, influence of changes in the density and stress on the horse-power developed, the consideration in detail of weight saving, proportions of least weight as affected by the number of cylinders, the rating rule, and some unaccounted factors.

The Vapour Emission Competition.

ON another page we give the judges' award in the Vapour Emission Competition held by the Royal A.C. on March 19th and 20th. It is gratifying to learn that although all could not be placed first in order, the judges found that the cars were, on the whole, successful, and that each competitor has been given the results of the analysis appertaining to his own car, with a view to such improvement as may be deemed desirable. The judges recommend that another competition be held on May 10th with a view to further encouragement in the direction of minimising the emission of vapour and of ascertaining the results of any improvements made in the cars not wholly satisfactory. This systematic testing and critical examination can only be productive of good, and we are glad to learn that the Royal A.C. has accepted the offer of a prize of fifty guineas by Mr. Dugald Clerk to the winner of the gold medal in the proposed further trial next month.

Motor-car Imports and Exports.

ALTHOUGH, as compared with the corresponding month of last year, there was an increased importation of foreign motor-car productions into Great Britain during March, the returns show that the rate of increase that has hitherto been recorded is not being maintained. The number of vehicles which reached this country during March is returned at 526, their value being given as £265,455. Parts were responsible for an additional £234,069, which gives a total of £439,524, as against £415,650 in the corresponding month of last year, and £314,535 in March, 1905. For the first quarter of the current year the figures are: Number of cars imported, 1,418; value of

same, £584,095; imports of motor parts, £580,672; total, £1,164,767. For the similar period of 1906 they were:—1,588 cars of a value of £617,981; parts, £506,081; total, £1,124,062. Turning to the exports of British motor-cars and parts, these continue to exhibit a very satisfactory increase. The number of cars shipped in March was 167, of a value of £67,700, while parts accounted for a further £42,894, the total of £110,594 contrasting with only £54,754 in the corresponding month of 1906. The aggregate exports of British motor-cars and parts during the first three months of the current year amounted to £315,602, as against only £159,178 in the corresponding quarter of last year.

The Lincoln Meet.

THE first of the provincial meets of the Motor Union will be held on Whitsun Saturday, the 18th prox., at Lincoln, on the invitation of the county Automobile Club. Having regard to the success of these gatherings last year, it is anticipated that the large attendance of motorists will tax the hotel resources of the city on the forthcoming occasion. At the evening dinner, Earl Brownlow, the Lord Lieutenant, will preside, supported by the Earl of Yarborough, Mr. C. D. Rose, M.P., Sir Hickman Bacon, Bart., and a large contingent of Lincolnshire M.P.s, including Lord Willoughby de Eresby and Mr. G. H. Roberts. The programme also includes a trip to Woodhall Spa, and a run across Tennyson's country, passing through Horncastle and Somersby. In addition to the social welcome that is being arranged, the municipal authorities are doing all they can to give motorists a favourable impression of their attitude towards the motor-car, and we understand that the mayor, Col. J. S. Ruston, J.P., is arranging that the route (three miles in length) between the Guildhall, Lincoln, and the grounds of Canwick Hall, where the gymkhana will be held, is to be specially swept and watered. Altogether, the Motor Union will have a good beginning for its summer meets of 1907.

Sign Posting the Roads.

To the Touring Committee of the Royal A.C. has been referred the consideration of the question of sign-posting Watling Street, which has been raised by Earl Russell. The idea is that a through route from London by way of Watling Street should be sign-posted, which would serve for Chester, Birkenhead, and the Isle of Man, for North Wales and Holyhead and via Liverpool and Preston for Carlisle. Apart from the Great North Road, this is perhaps the most important thoroughfare in the country, and, according to Earl Russell, it needs dealing with in this way because it is not at present recognised as a through route. Should the Touring Committee agree to the suggestion they have authority to take the matter in hand, so that those who go northwards during the summer may have the advantage of the notices which Earl Russell proposes.

Local Patriotism.

Nor often do we hear of local automobile clubs suggesting prizes for cars built within the area of their operations; hence the interest of the announcement we were able to make last week with reference to the offer of the Liverpool Automobile Club of a silver cup for the best motor-car built in the city of Liverpool. This club, which is a successor of the Liverpool Self-Propelled Traffic Association, which did so much to give an importance to the movement in the North of England at a time when it needed such assistance, has deserved the thanks of local traders for proposing such an incentive. It is, however, hardly likely that any considerable number of clubs will follow the example, or the difficulties of manufacturers would be increased to a considerable degree. The feeling of patriotism which has favoured the British car in some quarters cannot be localised so that the residents of any particular town will confine their investigations only to the merits of cars produced in their own district. At the same time, it is evidence

of the friendly feeling which is now developing in so many provincial centres, which are anxious to attract some branch of the motor industry unto themselves.

Motor-Buses at Chester.

ONE of the most enjoyable meets of motorists held within the last two or three years was that at Chester. It failed, however, to secure universal approval for automobilism in the city, and, apparently, the doctors there have much to learn on the subject of motor-vehicles. The Chester Town Council have, by thirteen votes to eleven, just rescinded a resolution passed in October authorising the purchase of three motor-omnibuses, at an estimated cost of £3,000, to serve the outlying districts not supplied by tramways. The meeting was convened by the mayor in response to a special requisition. Since the October resolution the necessary loan had been sanctioned and a tender accepted. Dr. Griffith declared that it was well known among medical men that where motor-omnibuses had been introduced the death rate had increased, especially among those suffering from chest trouble. Infantile mortality had also increased. All the doctors present voted for the rescission of the resolution. In view of the progress that the motor-bus has made in London during the last few months, the

On Friday (morning) of last week Mr. E. A. Paul left the Royal Automobile Clubhouse in Piccadilly, London, at 8.30 a.m. He reached Monte Carlo the following afternoon, at four minutes past six, the journey thus having taken 33 hours 34 min., being 1 hour 31 min. in advance of the previous record. The car was fitted with Dunlop tyres, and Mr. Paul is to be congratulated on the result of his first attempt at record-making.

vacillation of the Chester City Fathers seems ludicrous, while the statements made by the doctors are scarcely likely to be borne out by evidence.

Motor Races for the Public.

AT length the legal controversy following the Brighton race meeting of 1905 is at an end, the Court of Appeal having decided that the Town Council were justified in incurring expenses to attract visitors to the town. It will be remembered that the Brighton Corporation arranged with the Automobile Club to pave Madeira Road with Tarmac in order to provide a course for the motor-car races. This was done at a cost of about £3,000. Subsequently some of the ratepayers objected to the expenditure, and a Divisional Court held that the money had been spent without authority, and that the action of the Highway Committee was wholly *ultra vires*. Against this decision the Corporation appealed, with the result already mentioned. The case is of interest as establishing a precedent for other local authorities to expend money on securing perfect roads for motoring, if such expenditure is likely to result in increased visitors to the town.

THE VAGARIES OF MOTOR VEHICLES.

BY A. J. MCKINNEY.

(Continued from page 125.)

A NEW car was sent down to a client for a trial run. A change-speed gear with gate control was fitted. A start was made, and the first speed having done its duty, the second was requisitioned. On the change being made the car pulled up dead right in the middle of a busy crossing, while the engine raced away merrily. The symptoms were grave. "The cardan shaft broken?" no; it was only that the second speed seemed to be completely absent, though the third and fourth were as usual. The makers have so far not divulged the reason for this behaviour. A barrister friend had an unfortunate experience recently. He had left his car to be overhauled by a repairer in a county town not far from London. When advised that it was ready he called for it with three ladies and sailed gaily off. A few miles outside the town a loud crack was heard, followed by a grinding sound. Only the gear-box split from top to bottom, and a pair of pliers jammed in the gear wheels!

A good deal of trouble has arisen from defects or weaknesses in the transmission gear owing to inexperience on the part of manufacturers or the unskillfulness of the users. This, however, is now relatively very infrequent, though we still meet people

nothing they could suggest or supply was able to cure this trouble. At last the car was sent back to the manufacturers to be overhauled as a last hope. When there it was found that the differential gear had seized, so that the back axle was practically solid like a railway axle. When travelling round curves the outer wheel has a greater distance to go than the inner one, which means a tremendous strain on the tyres if there is no such device as the differential in operation. The difficulty was soon cured, though once it was most mysterious and the case seemed completely hopeless.

A friend's car was travelling in South Wales, near Swansea, at a fair pace when the left hand rear wheel came off. The car was dragged along on the live axle for some distance before it could be stopped, yet, strange to say, it did not get off the road, nor were the lady passengers frightened, for they hardly noticed the incident, at least so they said afterwards. The wheel was replaced and the vehicle was driven home to London, 200 miles without any trouble. Enough damage was done, however, to require a good deal of repair before it was advisable to use the car again. Such an incident would probably, in nine cases out of ten, have had very serious consequences; this one seems to be almost incredible, and yet it is a fact.

What volumes could be written about the shortcomings of the carburettor, the struggling with dirt, wrong-sized nipples,

The Kaiser's Prize Race.—A View of the Course at Königstein.

[Allgemeine Automobil-Zeitung.]

who have such ill-luck. In a case where a chain on a car was so damaged as to be useless, the motorist managed to get home on one, not having any spare chains with him. This was done by tying up the idle sprocket wheel so that it could not revolve. Perhaps there are more troubles with the chain drive than with the cardan shaft, but if anything does go wrong with this latter it is generally a more serious matter and not so easily remedied. I was once teaching a friend to drive a car which had a cardan shaft with a sliding or expansion joint made by the square end of the forward portion fitting into a corresponding socket on the other. There was only one torque rod fastened to the casing of the live axle. His foot slipped off the pedal and the clutch went in with a jerk, and caused the car to bound forward, after which it refused to respond to the engine. Investigation showed that the bolt holding the torque rod to the live axle casing had sheared its head, so that the casing had twisted partly round and drawn the two members of the cardan shaft apart. This was successfully remedied by means of a jack and the insertion of a fresh bolt.

A peculiar trouble and certainly a very uncommon one happened recently. A gentleman who possessed a fine new car suddenly experienced the most extraordinary run of ill-luck with his tyres. No matter what price he paid or how strong the tyres were, whenever he turned a sharp corner one of them was torn off. The various tyre manufacturers had a warm time of it, but

punctured floats, leaking needle valves, etc.! A car was found badly hung up on a hill which should never have given it the slightest trouble. The owner, who had only bought the car that day, was very angry and disgusted at its failure, particularly as he had three ladies on board. Another vehicle came up, the driver of which went to the rescue. On taking the cover off the float chamber he found it packed with cotton wool, so that the float was unable to fall in order to open the needle valve. When this was removed the effect was magical, for the car sailed away up the hill like a bird. The trouble was due to an oversight on the part of the makers, who had neglected to make certain that everything was in good working order. Other instances of carburettor troubles have occurred through the tank becoming air-bound owing to the cushion of a seat resting on the vent hole, and through water being in the petrol before it was poured into the tank. The use of the exhaust gases to cause the petrol to flow up to the carburettor has brought a similar trouble in its wake, as a certain portion of these gases form water on condensation, which, mingling with the fuel and entering the carburettor, has caused much perplexity and annoyance.

(To be concluded.)

A NEW garage and repair shop has been opened by Mr. H. Rae in Thornton Street, West Hartlepool.

CONTINENTAL NOTES.

Vehicle Trial.

As mentioned in our last issue, a three-days' trial of industrial vehicles has just been held by the Belgian Automobile Club, the total distance covered being 193 kilometres. The number of actual competitors was only five, which in the final classification were in the following order:—

	Average speed per hour.	Cost of Operation per kilometre ton.
1. Saurer 3½ ton lorry	21.48 kil.	032 franc
2. Orion 3-ton lorry	18.52 kil.	037 franc
3. Brillie 5-ton lorry	12.96 kil.	046 franc
4. Bovy-D. 30-cwt. van	18.00 kil.	062 franc
5. Bovy-D. 10-cwt. van	24.00 kil.	113 franc

A silver cup has been awarded to the Saurer vehicle as first prize; the Orion secures a gold medal presented by the Automobile Club of Flanders, and the Bovy-Dheyne a gold medal for being the first Belgian-built machine to finish.

Gobron, and Benz; and four each Züst, Isotta Fraschini, Fiat, and Itala. The drivers include such well-known names as Wagner, Duray, Hemery, Lancia, Hanriot, Gabriel, Nazzaro, and Cagno. The start will take place at Bonfernello at 5 a.m., the vehicles being sent off at three minute intervals.

Military Motor-Cars in France.

A practical test of the mobilising powers of the French motor reservists was made a few days ago, when a number of motorists were summoned with their cars to Vincennes, and there given orders to make a circular journey of about fifty miles under official observation. About twenty cars put in an appearance and the trip was carried out most successfully.

The Paris-Ostend Motor-Cycle Trial.

The Auto-Cycle Club of France has, at the instance of a number of manufacturers, agreed to postpone the motor-cycle reliability trial from Paris to Ostend and back, which was to

The Cars of the Motorists on the Reserve lined up at Vincennes, near Paris, for inspection by the French Military Authorities.

The Targa Florio Race.

Arrangements are well in hand for the annual Targa Florio race, which is to be held in Sicily on Sunday next. The contest will be held over a 150 kilometre course, taking in Cerda, Castelbuone, Petralia, Castellana, and Caltavuturo, this having to be covered three times to give the total distance of 450 kilometres. The conditions under which the event is run provide for four-cylinder cars having a minimum cylinder bore of 120 mm. and a maximum of 130 mm., or for six-cylinder vehicles of minimum and maximum cylinder diameter of 85 mm. and 90 mm. The weight of the machines is in proportion to the bore, at the rate of 1,000 kilogs. for 120 mm. bore, with an additional 20 kilogs. for each mm. above this. For six-cylinder cars the weight is 1,000 kilogs. for 85 mm. cylinder diameter, and 40 kilogs. per mm. in excess. Altogether there are fifty-four entries, these comprising one each Opel, Couverchel, Metallurgique, Chanon, and Gaggenau; two each Darracq, Pilain, Clement-Bayard, Berliet, De Dietrich, Lucia, Diatto-Clement, Radia, and Aigner; three each Rapid, Junior, De Luca-Daimler,

have been held next month, until July. Entries will now be received at single fees until June 15th, and at double fees until July 5th.

A Swiss Industrial Vehicle Trial.

The Swiss Automobile Club is organising a trial of public service and industrial vehicles to be held from the 10th to 14th May next. The competing vehicles will be divided into the following categories:—(1) Motor lorries and vans for loads up to 1½ tons; (2) ditto from 1½ to 3 tons; (3) ditto over 3 tons; (4) public service cars for from six to twelve passengers, and (5) ditto, for thirteen to twenty-four passengers. The first day's run will be from Zurich to Bâle; the second from Bâle to Berne, via Solothurn; the third from Berne to Thun; the fourth from Thun to Lucerne; and the fifth from Lucerne back to Zurich.

Co-operative Motor-Cabs in Paris.

A group of old cab-drivers in Paris have lately formed a co-operative society to introduce a service of motor-cabs in the

French capital. After trials of various makes, an order has been placed for a number of Delahaye 10-12-h.p. two-cylinder cabs.

Speed Trials in Italy.

Arrangements are in hand for the holding of a series of speed trials at Ferrara, Italy, on August 15th next. The programme will include a kilometre with standing start, a flying mile, and a flying two miles race. Categories will be provided for both racing and touring cars.

A Motor-Bus for Coal Miners.

The Wenzelaus Colliery Company, of Hausdorf, Germany, has recently made a new departure by acquiring a thirty-seated motor-omnibus, for the purpose of conveying the workmen who live at a distance to and from the mines.

Miscellaneous Items.

The Swiss syndicate of cycle and motor traders are organising a campaign for the introduction of standardised parts for motor vehicles, and have formed a permanent committee to communicate with similar organisations in other countries, with a view to further development of the idea.—In connection with the Paris *Salon* in December next it is proposed to organise a retrospective exhibition of motor vehicles, including the early cars of Panhard, De Dion, Mors, Renault, and other pioneers.—A number of taximeter motor-cabs are about to be put in service in Budapest.—The Brouhot Company, of Vierzon (Cher), France, are supplying a number of 10-h.p. four-cylinder vehicles to a co-operative motor-cab company in Paris.—A number of the cars entered for the Pekin-Paris trial were shipped at Marseilles on Sunday last on board the "Oceanien" for China.—The date of the next Paris *Salon* has now been definitely fixed; it is to be held earlier than last year, from November 12th to December 1st.—Entries at ordinary fees for the Herkomer Trophy competition closed on Sunday with a

Hieronymus at the Wheel of the Gaggenau Car he will drive in the Targa Florio Race.

total of 170 competitors, as against 142 last year.—Thirty-eight entries have been received for the A.C.F. Grand Prix race, the latest additions to the list being a Gobron and three Fiats.—The French Syndicale de l'Automobile has appointed a committee to consider the question of standardising the sizes of motor-car wheels and tyres.

THE T. & M. MULTIPLE JET CARBURETTOR.

THAT the last word on the efficient and economical carburation of petrol has not yet been said is evidenced by the large number of new carburettors which have made their appearance since the turn of the year. One of the

Section through T. and M. Multiple-Jet Carburettor.

most interesting is that known as the T. and M., which was shown at the Cordingley Show last week by the makers, Messrs. Trier and Martin, Ltd., of Trinity Works, Camberwell, S.E. Like other devices of the kind, it has been designed to automatically give a correct mixture of constant proportions of petrol and air at any speed of the engine. Referring to the sectional drawing herewith, B¹ and B² are two concentric cylindrical chambers of unequal diameters into which fits a hollow plunger of corresponding diameters, T¹ and T². The latter is provided with ports P, in the part T¹, also holes in the flange between T¹ and T², and a rod is fixed to the open end of T¹ passing through a cap screwed to the outer casing. The larger chamber is surrounded with a jacket W, for hot water or exhaust gas circulation, and A A are extra air orifices passing through the jacket. The main air supply enters at the outer end of the chamber B², through the openings S, which can be regulated by means of a shutter. The three jets are situated in orifices in the chamber B², and communicate with the float chamber F, which maintains the petrol at a constant level. The flange E is for connection to the admission pipe to the motor. The action is as follows:—When the plunger is in its extreme left position the ports P P are closed, the extra air is closed and the three jets covered. On moving the plunger to the right the part T² begins to uncover progressively and successively the three jets J¹, J², J³, and the effect of the suction of the motor is felt on the first jet, next on the first and second, then on the first, second, and third. The suction does not make itself felt on each jet suddenly, but in a progressive way, in proportion as the piston uncovers the three orifices, so that an increase in the supply of petrol is obtained in perfect proportion to the speed and power of the motor. At the same time as the jets are being uncovered the part of the plunger T¹ progressively uncovers the orifices A, and the extra air passes through the holes C C, meeting the mixture in the larger chamber, and in the meanwhile the throttle ports P P have been opening in the same proportion. It will thus be seen that as the throttle opens more petrol is supplied and more extra air admitted, and by regulating the size of the jets the proportion of petrol to air can be kept constant. To obtain extremely slow running of the motor when running light it is necessary to have a rather rich mixture, and a special form of automatic valve is fitted in the main air entrance, which automatically closes off the supply of air when the throttle is nearly closed, but which allows the full amount of air to enter when the throttle is open.

THE "Henry Edmunds" Hill-Climbing Challenge Trophy Race will be held this year on Carter's Hill, near River Hill, on the road to Tonbridge.

LORD ROSEBERY has been elected a member of the Royal A.C. Other new members include the Hon. Evelyn Boscawen, the Hon. George Duncan, Sir J. T. Woodhouse, J.P., and Sir W. E. Cooper.

MESSRS. ARGYLLS LONDON, LTD., who have become pioneers in the light motor-van industry, are encouraging honest and careful driving by offering a prize of £5 to all chauffeurs who show really economical records over runs of 5,000 miles. One of the most interesting successes in this direction is that of Mr. Alfred J. Attrick, who, although only for five weeks a pupil in the Argyll School in Newman Street, London, W., has since

been in charge of a van in the service of Messrs. Bastin, Merryfield, and Cracknell, the wholesale linendrapers, and who has just been awarded the prize mentioned above. His running bill for 5,054 miles included all costs in connection with petrol, oils, tyres, repairs, and renewals, and the total only reached £37 4s. 8d., or 1.7d. per mile, a good record indeed for so young a driver.

CAPTAIN JONES is a familiar exhibitor at the Aero Club's displays at the Agricultural Hall. He has discarded the bird theory and pins his faith, as becomes an old sailor, to the shape of the ship, as being the best for cutting its way through the air.

MR. ARCHIBALD GRAY has taken larger premises at Quarry Hill, Guildford, where he is trading as Archibald Gray and Co., and acting as district agent for Darracq cars. His business includes the letting of vehicles for hire and the overhauling of cars for customers.

THE 1,500 men who are employed in the construction of the Brooklands motor track at Weybridge are reported to be giving considerable anxiety to the authorities, and an increase of the local police, together with temporary lock-up accommodation, is being asked for.

MR. J. LYONS SAMPSON and Mr. G. Foster Pedley, who examined the Royal A.C.'s 14-h.p. Star car before it was sent to the makers for the necessary repairs, have officially reported to the Motor House Committee that the car was in excellent condition after its 11,000 miles' service.

AN attractive circular setting forth the advantages of the new Bleriot petrol-oxygen light has been issued from the London depot, 53 and 54, Long Acre, and should prove of service to all interested in the lighting of the car. It is claimed that the luminous intensity of the new light is twenty-five times more powerful than acetylene.

A NEW motor garage has been established by Mr. G. W. Hill at the corner of the Cromer and Railway Roads at Sheringham. The opening ceremony was performed in the presence of the leading residents of that favourite Norfolk resort. The building will accommodate thirty cars, and should prove of great service to motorists visiting the town.

HERE AND THERE.

SEVERAL Tourist Trophy cars have put in an appearance at Douglas, where the roads are now being put into condition for the event.

A NEW benzol fuel for petrol cars, known as "Motor Spirit,

Pyramid Brand," is about to be put on the market by Messrs. Major and Co., Ltd., Hull.

THE Percy Cycle Company, of Newcastle-on-Tyne, has secured a fine new garage in Northumberland Street, where they have extensive repair shops and plant to deal with any classes of mishaps.

MR. COLIN DEFRIES informs us that the Porthos car for the A.C.F. Grand Prix Race will be fitted with an eight-cylinder engine, rated at 110-h.p. The vehicle for the Coupe Sportive contest will be of 55-h.p., the engine being a four-cylinder one. The cylinder dimensions in both cases are 120 mm. bore by 120 mm. stroke.

THE judges appointed by the Roads Improvement Association to conduct the competitions for the best means of treating roads with tar to render them dustless have provisionally decided that the tests of the tar-spreading machines shall begin on Wednesday, May 22nd. The roads upon which it is proposed to carry out the tests are in Middlesex, between Hounslow and Staines, the Middlesex County Council and Staines Rural District Council having consented to give the necessary facilities.

AN interesting letter has been received by Mr. D'Arcy Baker, managing director of Fiat Motors, Ltd., from the two mechanics who some months ago went out to Africa in charge of the Fiat lorries sold to the Soudan Government for use in connection with the Cape to Cairo Railway. Writing from Wan, Central Africa, on the 1st ult., they state that after leaving Khartoum they had a sixteen-day journey up the White Nile to a place called Mesra-el-Rek, then they had a walk of over 100 miles before reaching Wan. "When we arrived here we were very disappointed to find no roads for the lorries to run on excepting the tracks that had been made by the natives"

donkeys, &c.; and, as you know we were distinctly told that there were seventy miles of macadam roads made, it came as a great surprise. After clearing the undergrowth away for about thirty miles of forest the lorries were loaded with stores and supplies, each weighing about three and a half tons net, and then we started for a station about seventy-two miles away, the whole of the natives turning out to see us start. We had a splendid run, the vehicles causing no trouble, and, bar the stoppages at villages for the officer in charge to talk to the chiefs of the different tribes, we had a non-stop run over roads where no heavy traffic had ever been. The return journey proved equally successful."

A NEW garage has been opened in Oxford Street, Swansea, by Mr. J. S. Brown.

It is estimated that there are sixty-four trades and professions represented in the work done on a motor-car before it is completed.

THE Daimler Company have secured an order from Lord Grantley for a 28-43-h.p. chassis, to be fitted with Claverdon landaulet type body.

WE illustrate herewith the "Marsh" terminal clip, for connecting ignition wires to accumulators, which has recently been introduced by Messrs. Louis Marsh and Co., 22 and 25, King Street, Liverpool. It has been designed to obviate the inconvenience and expense of broken lugs resulting through the attempt to remove terminal nuts that have corroded. As will be seen, it consists of two small levers pivoted at *E*; the lower one is

attached to the screw at *D*, while the upper one is forked at *C*, so that by turning down the milled nut *B* the outer ends of the two levers are made to grip the accumulator terminal. A glance at the illustration will show that the action is the same as that of the finger and thumb pinching the screw, thus obviating all twisting strain on the latter. It will also be seen that the leverage, with the purchase obtained by the milled nut *C*, provides ample power to secure certain contact and easy removal when necessary. The nut *A* for fastening the connecting wire acts as a lock-nut. The makers inform us that in actual trial on a particularly bad accumulator terminal it was found corrosion had taken place to such an extent that the lug and clip were to all intents and purposes solid, and the attempt to remove a nut under the circumstances would have resulted in a broken lug, whereas the Marsh clip came away without the slightest effort and without straining the lug in the least. The device is worthy of the attention of motorists who have suffered from corroded terminals.

FORD cars are now being handled in this country by Messrs. Perry Thornton and Schreiber, Ltd., 117, 118 and 119, Long Acre, London, W.C., who are organising a tour of Ford cars for calling upon agents throughout the whole country.

THE Upper District Committee of the county of Renfrew have granted permission to the Scottish Automobile Club to erect notice boards at Clarkston Railway Bridge and Greenbank Church, Renfrew, cautioning motorists, in the name of the Club, to drive slowly.

MESSRS. CORBEN BROTHERS have adapted part of their coach and motor body works at Richmond Road, Twickenham, to the purposes of a motor garage. Here they will have accommodation for nearly thirty cars, and will be able to execute all classes of repair.

MR. BALLIN HINDE, the hon. treasurer of the Motor Union, has returned from a visit to India, and made his first appearance in motoring circles since his return at the Exhibition at the Agricultural Hall, London, last week. He has succeeded in securing the affiliation of the Motor Union of Western India with the Motor Union of this country.

MR. H. E. STARLEY, of Raikes Road, Skipton, has sent us a photo of a little improvement he has lately devised in connection with the use of dual ignition on petrol motors. It consists of a divided spindle which allows the ordinary contact-maker to be at rest when the magneto is in use, thereby saving all undue wear. Mr. Starley informs us that he has had the arrangement running on a 20-24-h.p. car for the last five months, and that it is giving every satisfaction.

THANKS to the efforts of the Motor Union, the Board of Trade has prohibited railway companies from allowing any train to stand across the line at the level crossing of Palace Road, Ripon. The Union is now in correspondence with the London and South-Western Railway Company with regard to the improvement of the level crossing at Sunningdale, on the main London-Southampton road, and with the Great Eastern Railway Company respecting the level crossing at Ware, on the main road from Ware to Hertford.

PRINCE ALBERT OF BELGIUM has just ordered a Germain chainless chassis with racing body, this being his second car of this make.

OPPOSITE Harrod's Stores at 78, Brompton Road, S.W. Messrs. Arkwright and Yorke are now conducting a motor business for the convenience of West End motorists. They hold an agency for the Daimler cars and have excellent garage facilities.

SOME critical notes on the new Patents and Designs Bill, introduced by Mr. Lloyd George last month, have been written by Messrs. Ernest Lunge and Bernhard Dukes, which will be useful in explaining the provisions of the proposed legislation. It is published by Messrs. Stevens and Sons, Ltd.

MESSRS. J. E. E. HUTTON, LTD., send a copy of the new Berliet catalogue, dealing with the vehicle that performed so well in last year's Tourist Trophy Race. It is a veritable work of art, and takes a premier place even amongst the fine examples of design that have lately been issued by automobile firms.

A DISAGREEABLE feature of roadside adjustments is the grimy condition in which they usually leave the hands. A good plan is to clean the hands on the spot with a little petrol and cotton waste, and the Bowden petrol strainer will enable the necessary quantity of petrol to be drawn off from the small tap provided at the bottom of the strainer.

WITH reference to the announcement in our last issue as to week-end trips between London and Paris, we are informed that Elastes is being adopted by the Westminster Bridge Garage and Works, of Westminster Bridge Road, S.E., who are responsible for this service. It is thus hoped to minimise the liability of tyre troubles and secure that the "Entente Cordiale" motor service shall run with train-like punctuality. The 48-h.p. Gobron-Brielié is being employed, and it is the intention of the Westminster Bridge concern to develop motor touring during the season.

THE accompanying diagram illustrates the general arrangement adopted in connection with the Davison dash filler, strainer and petrol gauge that has been introduced by Mr. A. C. Davison, of 12A, Pleasant Row, High Street, Camden Town, N.W. This is a patented device intended for cars where the petrol tank is located under the driver's seat. It has already been proved by experience, and enables the driver to always know exactly how his petrol supply is being diminished without troubling other occupants of the front seat or himself. From the diagram the principle of the gauge is made clear. The apparatus consists of a metal box or funnel with a hinged lid. This contains a removable strainer of phosphor bronze gauze of very close mesh.

Below the box is a $\frac{7}{8}$ in. magnifying gauge glass communicating with the petrol tank by means of a $\frac{3}{4}$ in. pipe. The device is attached to the dashboard, where it does not detract from the general appearance, being well made and supplied with fittings to suit any particular vehicle. Thus for a very small outlay the motorist can always check his consumption of petrol, while the advantage of filling the tank from the dashboard without trouble and the use of the funnel is one to be appreciated. For the present season some improvements in detail have been made, among which we notice the increased size of the opening by which the tank is filled, an enlarged strainer, and the lid fitted all round the body to exclude rain.

ATTEMPTS AT FLIGHT.

MONDAY last saw the dispersal of many hopes and demonstrated to the public that the airship era is not yet. All last week models of aeroplanes and flying machines excited the curiosity of visitors to Cordingley's Motor Show and Aero Club Display at the Agricultural Hall, London; on Sunday they were taken from their resting-place and consigned to the obscurity of three great furniture vans, in which they were transported to the Alexandra Palace at Wood Green. On Monday they emerged from the darkness into the light of day and their inventors and designers took careful charge of these embodiments of years of thought and study.

So keen was the interest taken in the trials that an audience of about 3,000 people gathered in the great Hall of the Palace to watch the proceedings—often amusing, sometimes pathetic, as hopes were dashed to the ground and models fell to the floor simultaneously. Of the large number of exhibits which were shown in the Agricultural Hall, less than thirty were placed in the trial lists, and of these several were withdrawn by discreet inventors. As will be seen from the illustration, a space of about

greatest success. One of his double-decked models, propelled with twisted rubber, flew the full distance possible, landing in the net which was stretched at the end to protect the spectators, and making a flight of eighty-four feet. Another competitor whose machine flew well was Mr. F. W. Howard. The first three times his glider covered a distance of about sixty feet. At the fourth attempt the machine did better still, flying right up to the net, a distance of seventy-five feet, the inventor pulling it back with a string attached for the purpose, in order to prevent it from being damaged in its fall.

The second part of the competition was held in the grounds of the Palace, and there a great crowd assembled to watch the failures that took place. The air was calm and no gusty currents retarded or assisted the attempted flight of the models. The ground on which the test took place sloped a considerable distance and was a pleasant venue; but it did not assist the competitors. Mr. W. Cochrane's corrugated aluminium machine was thrown high into the air but quickly returned to grass; Mr. R. M. Balston's "bird" broke one of its two propellers; a rocket surrounded the aeroplane of Mr. F. W. Thomas with plenty of smoke, from which it could not get clear away; Mr. H. A. Chubb's motor was in difficulties and

Mr. A. V. Roe's Aeroplane making the flight which secured the Second Prize for its Inventor.

100 feet square was cleared for the trials, a platform of about five feet high being the starting point of the machines. The judges were: Professors Huntington and Waynesforth, of King's College; Colonel Capper, Chief of the Military Balloon Section at Aldershot; Mr. Roger Wallace, Chairman of the Aero Club, and Mr. Patrick Alexander, a friend of the Wright Brothers, while Mr. Harold E. Perrin, the secretary of the Aero Club, generally supervised the proceedings with customary regard for the comfort and convenience of all concerned. Major-General Baden-Powell and Colonel Cody were among the spectators.

Of all the competitors only two attained anything approximating success. Mr. H. Crouchley's aeroplane fell on its rudder when the force of the preliminary throw was spent, and Mr. H. H. Piffard's model bent its propeller on the first attempt. Nearly forty feet were covered by Mr. P. P. Clarke's machine ere it fell, the combined force of the propeller and the inventor's "throw" securing such a result, the most encouraging up to that point. The great Albatross, that was generally surrounded by a crowd at the Agricultural Hall, only flew 10 ft., and then fluttered down on to its beak. Mr. H. B. Webb's three-decker aeroplane, after rising to some height, capsized, and made a rapid descent, which ended in the damage of the machine. Of those who competed in the Hall, Mr. A. V. Roe achieved the

Mr. Montford Kay's five-decker apparatus did little more than turn a somersault. Again Messrs. Roe and Howard were easily in advance of their rivals. Mr. A. V. Roe's Aeroplane flew full into a net ninety feet away, and Mr. F. W. Howard's glider, the screw driven by a coiled spring, went over 71 ft. After making slight repairs in the next two trials the machine covered respectively 88 ft. 5 in. and 108½ ft., part down hill. It would probably have gone farther on each occasion, but the crowd got in the way, and the police failed to keep a clear space.

In the end the following awards were made by the judges:—

MODEL FLYING MACHINES.

First prize £150.—Not awarded.

Second prize £75.—A. V. Roe, 47, West Hill, Wandsworth, S.W.

Third prize £25.—F. W. Howard, 18, Egerton Gardens, West Ealing, W.

MANUFACTURERS' SECTION at the Exhibition at the Agricultural Hall. Gold medal.—Short Bros.; for balloon exhibits.

Silver medal.—Truss and Company; for Method of Constructing Propellers.

Silver medal.—Ezio Tani; Model Flying Machine.

Bronze medal.—Shank and Taylor; for Method of Constructing Propellers.

The Cordingley Show.

(Continued from page 138.)

HEREWITH we continue our report of the exhibits at the twelfth of the Motor Car Shows at the Agricultural Hall, London, which closed on Saturday last. During the week the attendance had been well up to the records of previous years, and the announcement of the date of next year's exhibition, March 21st to 28th, was duly noted, not only by exhibiting firms, but by those who were unrepresented on this occasion.

The Mann Steam Wagon.

MANN'S PATENT STEAM CART AND WAGON COMPANY, LTD., exhibited a 5-ton steam wagon of their standard type, but fitted with a special body, to the order of the Powell-Duffryn Steam Coal Co., Ltd., Aberaman offices, near Aberdare. This firm was one of the first to manufacture steam motor-wagons, and have from the start adopted locomotive type boilers, and an all-gear drive. The working pressure is 180 lb. per square inch, and the heating surface 80 square feet. The engine, of the compound horizontal type, has cylinders $4\frac{1}{2}$ in. and $7\frac{1}{2}$ in. diameter by 7 in. stroke, with a single eccentric reversing gear, actuating

General View of the Cordingley Show taken from the North Gallery.

The Wellington Tractors.

Messrs. W. FOSTER AND CO., LTD., of Lincoln, were present with a couple of their well-known steam tractors, one having water tanks sufficient for fifteen miles, and the other for thirty miles. The machines are designed on traction engine lines, with locomotive boiler. Special provision is made for cleaning out the latter in the shape of a hand hole in the fire-box casing, level with the crown of the fire-box, and another at the top of the smoke-box tube plate. The engine is a two-crank compound, the cylinders being $4\frac{1}{2}$ and $6\frac{3}{4}$ in. bore by 9 in. stroke. The slide valves are on the top of the cylinders, operated by ordinary link motion, and an auxiliary valve admits steam to the low-pressure cylinder for ease in starting. Both machines are fitted with all latest improvements, including feed-water heater, feed control valve, special spring-mounting method, winding drum and rope, together with geared feed pump and injector. Messrs. Foster and Co. have supplied no less than six of their Wellington tractors to the British War Office authorities.

plain slide valves. The boiler forms part of the main frame, and it is extended back by steel plates riveted to the back of the boiler and forming the side sheets of the oil bath, and also of the water tank. The whole of the motion work and of the gearing is enclosed in this oil bath. The special body referred to above consists of four separate steel compartments on runners, each of which may be tipped to either side of the vehicle, and may be lifted by tackle from the chassis.

A Four-Wheel Drive Electrical Vehicle.

In addition to the two-ton electric delivery lorry, referred to in our last issue, the IMPROVED ELECTRIC TRACTION COMPANY, LTD., of Cockspur Street, London, S.W., had on view the chassis of an interesting American-built electric car, suitable for use as a delivery vehicle or public service machine, inasmuch as four electric motors are provided, one to each road wheel. They are supported from the axles, the power being transmitted direct through enclosed spur gearing; the motors are each of 4-h.p., but are so designed that they are able to withstand a considerable overload.

PETROL VEHICLES.

The Astahl Cars.

The CENTURY MOTOR COMPANY, LTD., of Willesden Junction, the London agents, exhibited for the first time in this country an interesting series of cars known as the Astahl, which are worthy of attention on account of their moderate price. The 6-h.p. and 8-h.p. models are fitted with De Dion engines, while the 10-12-h.p. (Fig. 21) is provided with a four-cylinder motor, 75 mm. bore by 90 mm. stroke, all in one casting. The water circulation is either by pump or on the thermo-siphon system

Fig. 21.—Chassis of Astahl 10-12-h.p. Four-cylinder Car.

as desired. A high tension magneto is provided on the large car in addition to that by coil and accumulators, as is also a Grouvelle-Arquembourg carburettor. The transmission is through a cone clutch three-speed gear-box and cardan shaft to a live axle. Ball bearings are used throughout, except on the engine, while a noticeable and useful feature is that the engine, clutch and gear-box and differential are so arranged that each can be dismantled independently without interfering with the other parts.

The Victoria Car.

A new comer to the Agricultural Hall displays was the VICTORIA MOTOR WORKS, of Godalming, which are now turning out an attractive 10-12-h.p. vehicle. The chassis, of which we give a view in Fig. 22, is fitted with a 10-12-h.p. engine, comprising four separately cast cylinders with m.o.v. valves. The usual accumulator ignition is provided, and the mixture is furnished by a Longuemare automatic carburettor. The radiator is of the framed ribbed tube type of a neat and distinctive shape, and we note that the water circulating pump is located in an accessible position. The transmission is through a clutch of the leather-faced cone type, three speed and reverse gear-box, and thence by a cardan shaft to a live axle of substantial construction. With front

Fig. 22.—Chassis of "Victoria" 10-12-h.p. Car.

glass screen and side entrance double phaeton body, the Victoria forms an attractive little car, which has already earned a reputation in Surrey for its hill-climbing capabilities.

The Metallurgique Cars.

Prominent among the display of cars on the stand of METALLURGIQUE CARS was the 24-28-h.p. model which, since its victory in the Coupe de Liedekerke last year, has attracted considerable attention. A feature of the engine (Fig. 23), which comprises four cylinders, 102 mm. bore by 115 mm. stroke, is that the crank shaft is *desaxe*; that is to say, the cylinders are not in a perpendicular line with the crank shaft, an

arrangement which is claimed to reduce the friction between the cylinders and their pistons. The cam shaft is also placed eccentric to the valves to prevent side friction to the valve tappets and seats, and, what is equally important, a quicker opening of the valves themselves. The valves of each cylinder are held by long and elastic springs, and can be disconnected by simply removing a small cotter and cap. The pinions driving the magneto, the water-circulating pump, and the half-time shaft are enclosed in an aluminium casing, which forms part of the crank chamber. The crank shaft runs on special bronze bearings, and attached to one end is a flywheel nearly 24 in. in diameter, which acts also as a fan. The Metallurgique automatic carburettor, which is claimed to furnish a suitably-proportioned mixture at any engine speed, is controlled by a centrifugal governor, and also by a lever on the steering wheel. In addition to this a pedal is provided, by means of which the governor can be cut out of action and the engine accelerated up to its full power. Two systems of high tension ignition—accumulators and magneto—are fitted. The cylinder-cooling water is circulated by a powerful gear-driven pump actuated through a spiral spring, so that should the water congeal in the pump during cold weather the spring will be the first to break, and no further damage can be done. From the motor the power is transmitted to the gear-box by a metal-to-metal expanding clutch, which resembles in principle an internally expanding brake, two wide semi-circular brake-shoes being forced apart so that they press against the inner walls of the flywheel boss. The gear-box is adapted to give three forward speeds and a reverse, with direct drive on top, controlled by a single lever working in a "gate." The gear wheels are made of a special chrome nickel steel and are hardened by a new process rendering them practically unwearable.

Fig. 23.—The Metallurgique 24-28-h.p. Motor.

From the gear-box to the back axle the power is transmitted by a cardan shaft and bevel gear through a patent spring drive. The hand brakes are of the internal expanding pattern, and act on the back wheels, while the foot brake works on a drum on the driving shaft. The steering gear, which is of the worm and sector type, is so arranged that any wear can easily be taken up. To facilitate steering and to save wear and tear on the tyres the front wheels are attached to the axle in such a way as to cause all the weight to fall exactly on the centre of the tread of the tyre. Ball bearings are used throughout, except on the engine. The chassis is sufficiently large to allow of comfortable and roomy limousine bodies with a wide side entrance being fitted. The Metallurgique cars are being made in a wide range of sizes, those on view comprising a 16-20-h.p. landaulet, a 20-24-h.p. limousine, a 24-28-h.p. chassis, a 30-35-h.p. double phaeton, and a 30-35-h.p. limousine. The body of the latter, by d'Ieteren, of Brussels, was especially noteworthy, the sides being so made that they can be removed, the roof remaining in position.

The Armadale Tri-cars.

The NORTHWOOD ENGINEERING AND MOTOR WORKS, of Northwood, Middlesex, have now taken up the construction of the Armadale Tri-Cars, and had on view at the Exhibition last week a two-seated machine fitted with an 8-10-h.p. two-cylinder motor. The principal feature of the vehicle lies in the variable change-speed gear with which they are fitted. The crank shaft of the engine carries at its rear end a large disc; at right angles to this is another large disc, which can be moved along a square shaft. By varying the position of the two discs one to the other any speed from zero to maximum can be attained; while if the sliding disc is moved over the centre of the fixed one the

car is driven in a reverse direction. A single chain transmits the power from the sliding disc shaft to the rear road wheel. The machine has comfortable accommodation for two passengers tandem fashion, and is able to attain a good turn of speed.

The Adler Car.

Quite a new series of cars were displayed by Messrs. Morgan and Co. Ltd., of Long Acre, London, W.C. We refer to the Adler vehicles, which are manufactured at Frankfort-am-Main by one of the largest

clutch and gear-box are built up and fixed in the frame as a unit. The engine comprises four cylinders, cast in pairs, the bore being 130 mm. by 140 mm. The valves are all operated off a single cam shaft, the gear wheels operating which are entirely enclosed. Two systems of high tension ignition are provided—magneto and coil—while the carburettor is of a special automatic type, the throttle being controlled both by a centrifugal governor and a lever on the steering wheel. The lubrication of the engine is effected by a pump operated off the governor spindle. The

Fig. 24.—Chassis of Adler 50-h.p. Car.

Fig. 25.—The Engine, Clutch and Gear Box of the Adler 50-h.p. Car.

motor concerns in Germany, and for whom Messrs. Morgan have secured the British agency. The vehicles are made in three sizes—18-h.p., 23-h.p., and 50-h.p.—and as the general arrangement of all is practically identical, the following particulars of the 50-h.p. car, of which we give a view in Fig. 24, may be taken as applying to the others. A feature of the Adler construction is, as will be seen from Fig. 25, that the engine,

clutch is of the metal-to-metal disc type working in oil, while the gear-box is of the sliding pinion variety, adapted to give three speeds and reverse with direct drive on top speed. The control is by a single lever working in a "gate." A neat arrangement is provided, which prevents the reverse motion to be engaged by mistake, a small cap to the top of the lever having to be lifted up to enable a knob within to be pressed

down. The final transmission is by a cardan shaft and bevel gear to a live axle. The cardan shaft is enclosed over its full length, the sleeve acting as a torque rod. Two radius rods also extend from the forward end of the cardan sleeve to the frame. Both foot and hand brakes are provided; the former is water cooled, a small pedal slightly in advance of the main one opening the water supply whenever the brake is applied. Ball bearings are fitted to all parts except the engine crank shaft, and the pressed steel frame, the side members of which are quite straight, is supported on long springs. There are many other points of interest in the Adler vehicles, but the foregoing particulars will give an indication that they are the result of expert design and consequently well worthy the inspection of

The Withers Car.

The display of Messrs. WITHERS AND CO., LTD., London, W., was interesting as showing the tendency of the times. The firm have for a long time been established as job masters, but, finding their business being interfered with by the increasing popularity of automobiles, they have converted part of their stables into a garage and works, where they are now turning out motor chassis and bodies. At the Show they had on view a 24-30-h.p. chassis, built on modern lines throughout. The motive power is supplied by a Barriquand and Marre four-cylinder engine, with two systems of high tension ignition—Eisemann magneto and coil and accumulators. The clutch is of the leather-faced cone type, and in place of the ordinary single clutch spring six small ones are employed

Fig. 26.—Chassis of Creese 12-h.p. Car.

motorists. A 22-25-h.p. Mercedes car fitted with a luxurious landaulet body, the latter of the firm's own construction, and the "Cromwell" patent folding wind screen were also on view.

The Creese Car.

There are several points of interest in the new car exhibited by Mr. A. E. CREESE, of East Dulwich, of which an elevation is given in Fig. 26. The vehicle, which is of French construction, being built by the Societe des Automobiles de Vierzon, is of 12-h.p. and is of the live axle variety. The cylinders of the four-cylinder engine are cast in pairs, and have the valves arranged on opposite sides. The water circulation is by thermosyphon, and we note that the fan, which draws a current of air through the ribbed-tube radiator, is mounted on a ball bearing. The carburettor, which is provided with a hot-water jacket, is of the automatic type, while the ignition is by low tension magneto. The lubrication of the motor is controlled by a pump, which forces the oil from the tank through a sight-feed lubricator on the dashboard. The control is by two levers on the steering wheel, one actuating the ignition and the other the quantity of mixture passing to the cylinders, the latter also varying at the same time the amount of petrol allowed to pass through the

these being so arranged that they can be readily adjusted. The gear-box is adapted to give four speeds forward and a reverse, with direct drive on the top, the control being by a single lever working in a "gate." The final transmission is by a cardan shaft and bevel gear to a well-designed live axle. Ball bearings are used to all parts except the engine, and the frame, which is raised at the rear to give clearance for the differential casing, is supported on five long springs. A 24-30-h.p. limousine on similar lines to the above, but fitted with an Aster engine, was also on view. The body of this vehicle, which was of the firm's own construction, was of a pleasing design, a small door being provided in the centre of the front seat, which is provided with a detachable cushion, so that a passenger can change his position and ride either inside or out, without having to descend on the road. We may add that Messrs. Withers undertake to do all repairs and renewals to their cars at cost price for a period of two years from the date of purchase, and are also prepared to enter into an annual maintenance scheme for a fixed sum supplying a competent driver, tyres, petrol, oil, repairs, renewal, insurance, &c.

Fig. 27.—Chassis of Bolide 15-h.p. Car.

jet. Other features of the vehicle include the clutch, which is of the cone type, the male portion being built in halves, so that it can be readily detached. The gear-box is made under the Renault licence, giving a direct drive on the top speed through a cardan shaft and bevel gear to a well-supported live axle. At this stand was also to be seen an electric motor starter, this consisting of an electric machine arranged to run either as a dynamo or as a motor. It works in conjunction with a small battery of accumulators and is geared to the flywheel of the engine, the latter being provided with a toothed ring for the purpose. To start the engine, the electric machine is run as a motor off the battery. The latter is kept fully charged, for, once the petrol engine is in operation, any current drawn from the accumulators is replaced by the combined dynamo-motor.

The Bolide Car.

In addition to the Aries cars, reference to which was made in our last issue, the AUTOMOBILES DE LUXE, LTD. (West End Agency), also had on view another French-built car, the Bolide (Fig. 27). Following the general lines of live axle cars, one of the main features of the vehicle is its relatively low price. The 15-h.p. engine comprises four cylinders, 90 mm. bore by 120 mm. stroke. Simms-Bosch high-tension ignition is fitted and the valves are all mechanically operated off a single cam shaft. Universal shafts are provided both fore and aft the gear box, and the ball bearings of the D. W. F. type are fitted to the axles. The pressed steel chassis is carried on five springs, which renders the vehicle very easy riding.

The Brown Cars.

The great attraction at the stand of Messrs. BROWN BROS., LTD., was a 40-h.p. six-cylinder car fitted with a luxuriously finished landaulet body. The details of the vehicle have already been published in the *M.C.J.*, but it may be briefly mentioned that the engine, the cylinders of which are 100 mm. bore by 130 mm. stroke, is provided with both magneto and accumulator ignition. Special attention has been paid to the question of lubrication, as also to the water circulation, which latter is by gear driven pump and a Megevet type of honeycomb radiator. A

run from London to Brighton and back on top gear has attracted considerable notice was evidenced by the great attention which was accorded to the stand of REO MOTORS, LTD. We first inspected the 8-10-h.p. vehicle (Fig. 29) which can carry either two or four passengers, the rear seat being ingeniously made to fold up when not in use. The engine, which is set about the centre of the frame, is of the single-cylinder horizontal type, the bore being 4½ in., the stroke 6 in., and the normal speed 800 revolutions per minute. The ignition is by coil and accumulators and the water circulation by a gear-driven pump. The change-

Fig 28.—Chassis of Brown 40-h.p. Six-Cylinder Car.

large leather clutch transmits the power to the gear-box, which gives four-speeds forward and a reverse, controlled by a lever working in a "gate." The transmission is by a cardan shaft and bevel gear to a live axle, the drive on the top speed being direct. Ball bearings are fitted to all parts except the engine; the wheel base is 10 ft. 6 in., which enables a roomy body to be fitted to the chassis. A useful car for travellers and others requiring a reliable and speedy little machine at a moderate price was seen a 10-12-h.p. vehicle fitted with a two-seated body and large sloping tool box at the rear. This is equipped with a

speed gear, which is of the epicyclic type, is adapted to give two speed and a reverse, actuated by pedals; the gear is mounted on an extension of the crank shaft, a single chain transmitting the power to the rear live axle. Other cars on view included a 16-h.p. double phaeton, a useful 20 cwt. van of similar power and an 18-h.p. side-entrance double phaeton with double extension hood and front glass screen, having accommodation for five passengers. In these larger vehicles the engine is of the horizontal opposed double-cylinder type, the transmission being similar to that referred to above. A dashboard of the curved type is fitted to the

Fig 29.—The 8-10-h.p. Reo Car.

double-cylinder engine having the usual type of accumulator ignition, the control levers being conveniently located on the steering wheel. Like the larger car, a live axle is provided, a direct drive thereto being provided on the top, third, speed. The long springs employed add to the easy riding qualities of the car, which can, if desired, be equipped with a four-seated body.

The Reo Cars.

That the excellent performance of a Reo car in recently making a

18-h.p. vehicle, which is also provided with a special type of automatic carburettor, half-compression cocks, &c. In the latest models the bodies have been lowered 2½ in. and the length increased 7 in., to bring them more in accordance with English practice. All the cars are fitted with Goodyear tyres, which are noticeable for the ease with which they can be detached without the use of tools. The Reo cars have an excellent reputation for their quiet running and hill-climbing qualities, and, in view of their relatively low price, are finding a steadily enlarging clientele in this country.

The Jackson Cars.

One of the exhibits appealing particularly to the motorist of moderate means was that of Messrs. R. REYNOLD JACKSON AND CO., who had a range of the Jackson cars on view. They are all on modern lines, being fitted with pressed steel frames, push pedals, framed ribbed-tube radiators, and transmission by cardan shaft and bevel gear on to a live axle. The 6½-h.p. phaeton is a neat machine, the rear seat access to which is through a tilting front seat, being removable, rendering the car well adapted for commercial or station work, as a large amount of luggage can be carried. The engine is a De Dion, and three speeds and a reverse are provided. The 9-h.p. vehicle can be supplied either with a De Dion single-cylinder or Gnome double-cylinder engine; it is built either as a two-seated or four-seated dog-cart, or as a standard

Fig. 30.—The Jackson 8-9 h.p. Dogcart.

side-entrance double phaeton. The latter is mounted on a longer chassis than usual, and a specially strong back axle. The ignition and throttle levers are also mounted above the steering wheel. The Jackson dog-cart which we illustrate above in Fig. 30, has been considerably improved. It is fitted with the latest type of 8-9-h.p. single-cylinder De Dion engine with mechanically-operated valves. The wheel base is longer, enabling a more roomy body to be provided; the latter is now provided with a curved back in place of the somewhat stiff lines hitherto adopted. The seats are made detachable, so that the car can be made to serve a double purpose—that is to say, it can be used both for pleasure and also for delivery purposes. Another interesting vehicle is a side-entrance double phaeton with a 10-12-h.p. engine, the four-cylinders of which are cast in one piece.

The Fouillaron Car.

In our report of the Paris Salon in December last reference was made to the somewhat novel progressive change-speed gear and transmission employed in the Fouillaron car. The system is now being introduced into England, and at the Show Messrs. MAINETTY AND CO., of Putney, exhibited a 14-16-h.p. four-cylinder chassis, suitable for a 15-20 cwt. delivery van. As will be seen from Fig. 31, the engine is set in the fore part of a pressed steel frame in the usual way, and drives through a clutch a pulley connected to a second pulley by a combination chain belt of peculiar construction. Each pulley is formed of two lamellated jointless cones, the arms of which are so intertwined that the inner end of each cone penetrates the interior of the other. The bottom of the pulley is represented by the circumference limiting the intersection of the two cones opposed to each other. One of these cones is movable, and can, by sliding along the shaft, penetrate more or less into the stationary lamellated cone, and thus modify the diameter of the belt on which the belt rests. A lever, connected to a non-reversible

Fig. 31.—Plan of Fouillaron Car with Special Variable Speed Gear.

driving mechanism, enables one of the cones of each of the pulleys to slide along simultaneously, but in the opposite direction. This movement causes a variation in the diameter of the pulleys without modifying the tension of the chain, and enables the entire range of speeds, from a gear equal to five miles per hour up to one giving twenty-eight miles, to be obtained. A spring, the tension of which may be safely regulated whilst the car is running, is inserted in the driving gear, and tends to augment at the same time the diameter of the two pulleys. It automatically takes up all play that might be set up at high speeds by centrifugal force, and does away with slipping of the belt. The latter consists of a series of links or blocks of chrome plated leather mounted upon a chain of case-hardened steel. The

haft on which the second pulley is mounted is connected with the rear axle by a cardan shaft in the usual way. The reverse is obtained by means of a second bevel wheel on the differential shaft; the bevel pinion on the rear end of the cardan shaft is mounted on an eccentric sleeve, so that, by means of a special lever, it can be brought into mesh with either the forward or reverse driving crown wheel. The speed may be varied without disengaging the gear, which enables practical advantage to be taken of all speeds comprised between the limits available. Thus when ascending a gradient it is not necessary to "race" the engine; on the contrary, the latter should be kept running at its normal speed, the gear being varied slightly to suit.

Fig. 32.—Plan of Chassis of the Dawfield-Phillips Cab.

The Dawfield-Phillips Car.

The illustrations herewith (Figs. 32 and 33) depict the interesting new vehicle which was shown for the first time by Messrs. Dawfield-Phillips, Ltd., of West Ealing, W. The vehicle, which is exceedingly simple in design, is provided with a 12-h.p. double-cylinder horizontal opposed engine, located at about the centre of the frame; the cylinders are 4½ in. bore by 4½ in. stroke, and the normal speed is 750 revolutions per minute. In order to obviate the trouble of leaking oil, each cylinder is cast in one piece with half of the crank chamber, which are bolted together. Hollow valve guides are also cast in one with the cylinder and half crank case, the valve stems, which work within them, being lengthened so that they are actuated off the cam shafts without the intervention of the usual tappets. The object of the designers in adopting this construction has been to prevent oil leakage owing to the pressure in the crank case.

Fig. 33.—The Dawfield-Phillips Cab.

Ignition is by coils and accumulators, the contact maker being located on the crank shaft, and not, as usual, on one of the half-time spindles. The lubrication of the engine is effected by a pump driven off one of the cam shafts, while the water circulation is on the thermo-syphon principle, no pump being employed. The radiator is of a special type, both the inlet and outlet pipes being located at the bottom, so that the water has to pass both up and down the tubes of the radiator, so increasing the cooling effect. The engine control is effected by means of two levers mounted on the column below the steering wheel. The change speed gear is mounted on an extension of the crank shaft; it is of the epicyclic type so largely used on American cars; it is adapted to give two forward speeds and a reverse, the final transmission

being by a single centrally-located chain to the rear live axle. Semi-elliptic springs are employed at the rear for the suspension of the main frame, and full elliptic springs at the front. Ball bearings are used to all parts except the engine. The vehicle can be fitted with either a landaulet, cab or light van body, these being hinged at the rear so that they may be tilted up to give access to the engine; the car is capable of being turned in a twenty-foot road, so that it comes well within the Scotland Yard limits for public service vehicles. The makers claim that the flexibility of the engine is such that the speed of the car can be reduced to six miles per hour on top speed.

The Horch Cars.

The fact that it was a Horch car which won the 1906 Herkomer Touring Trophy contest caused the initial exhibition of these cars in this country by Horch Motors, Ltd., to come in for an unusual amount

Fig. 34.—The Horch Limousine supplied to the Grand Duke of Oldenburg

of attention. Two models were shown—18-22-h.p. and 35-40-h.p., both fitted to four cylinder-engines, but, as these are built on practically the same lines, the following description of the more powerful car may be taken as applying to both. The cylinders, which are 115 mm. bore and 140 mm. stroke, are cast in pairs, with the valves operated off a single cam shaft, the inlets being situated in the cylinder heads and actuated by tappets. The carburettor is of a special automatic type with a multiple jet feeding in progression according to the requirements by the engine. The jet has three orifices, two in the form of slits in the sides, and a larger one in the apex. Around its base are two concentric annular air intakes. Above it and normally resting on the apex of the jet—and so closing the third source of petrol supply—is a baffle cone which forms part of the roof of a ported piston—the latter admitting the mixture to the cylinders. The lower end of the piston has an annular ring, which, when the third jet is closed, covers the outer annular air intake, so that, so long as the baffle cone rests on the apex of the petrol jet, only the inner air intake is open. This ported piston, however, is free to slide up and down in the walls of the mixing chamber,

circulation is maintained by a gear-driven pump and a special form of tubular radiator with fan: the spindle of the latter is supported in a bracket, which can be slid up or down, and the tension of the belt thereby adjusted. The clutch is of the leather-faced cone type, the spring being arranged somewhat different to the usual plan, it being in tension instead of compression. Four speeds and a reverse with direct drive on top speed are controlled by a "gate" lever. From the gear-box the power is transmitted to the live axle through a cardan shaft and bevel gear. A sleeve which surrounds the propeller shaft not only protects the latter but acts as a torque rod, two side radius rods being also provided. As in all modern high-grade cars, ball-bearings are used to all parts, even

Fig. 35.—The Horch 35-40-h.p. Engine.

the crank and cam shafts of the engine being so provided. The Horch cars, which are built at Zwickau, in Saxony, are, as will be seen, on thoroughly up-to-date lines, a noticeable feature of the engine being its great flexibility and silent operation.

The Westinghouse Cars.

Messrs. A. GAAL AND CO., who, as we recently mentioned, have acquired the British agency for the cars made by the Westinghouse Company at Havre, had an interesting and instructive display of these high-grade productions. Two models are being made for the current year, the 35-40-h.p. chain-driven vehicle being supplemented by a 20-30-h.p. live axle car intended for town use. In the larger machine the engine comprises four cylinders, 120 mm. bore by 140 mm. stroke, cast in

Fig. 36.—Chassis of Westinghouse 35-40-h.p. Car.

being controlled by a light spring. When the engine is running light, the single air feed and double jet satisfy its needs; but as soon as the speed increases the ported piston is drawn upward to simultaneously uncover the third petrol jet and the supplementary supply of heated air. A special valve, set beneath the air intake and operated from the dashboard, controls the amount of hot air admitted, while the usual throttle valve operated from the steering wheel controls the gas supply. The carburettor draws its petrol by gravity from a small tank on the dashboard, the latter being, however, pressure-fed from the main reservoir. A single switch of special design controls the dual ignition system provided—high tension magneto and coil and accumulators. The water

two pairs, with the valves mechanically actuated off separate cam shafts. The carburettor, low tension magneto, and pump are all mounted on the engine. The governor is enclosed in the crank chamber; it acts on a piston throttle regulating the admission of gas to the engine, an accelerator pedal being also provided. The clutch is of the metal-to-metal disc type, and is so arranged that it can be removed without interfering with the engine or the gear-box. The latter is adapted to give four speeds and a reverse, with direct drive on top speed. Two large diameter foot brakes are provided on the differential shaft, as also a hand brake acting on the hubs of the rear wheels. All the brakes are so arranged that they can be adjusted by hand. Except as regards the

transmission and the ignition, which is by high-tension magneto, the 20-30-h.p. vehicle is on similar lines to the 35-40-h.p. The hind road wheels run on the axle sleeve and receive the power from the live shafts through the hubs. The cars are fitted with a new shock damper, in which an oil-containing inverted cylinder is mounted on the rear axle, a piston rod, working in the same, being bolted rigidly to the side members of the frame. In addition to a polished chassis of each model, the exhibit comprised a magnificent 35-45-h.p. limousine, similar to that supplied to Prince Eitel of Prussia. Altogether the Westinghouse cars made a

interesting details. The engine comprises four separate cylinders 100 mm. bore by 120 mm. stroke, with the interchangeable m.o.v. valves arranged on opposite sides. The crank shaft, which is made of nickel steel, is provided with a bearing between each throw. Ignition is by Simms-Bosch high-tension magneto, and the mixture furnished by a special form of gravity-fed automatic carburettor for which great economy in petrol consumption is claimed. The water circulation is maintained by a rotary pump driven off the engine, and a neatly-designed tubular radiator, a current of air being drawn through the

Fig. 37.—View of the Renard Road Train Showing its Capability of Negotiating Sharp Curves.

favourable impression, the workmanship well upholding the reputation of the company in other branches of engineering work.

The Renard Road Train.

The Renard road train demonstrations in the streets adjoining the Minor Hall were a source of public interest throughout the week. As we have recently shown, the system secures many advantages that render its adoption in rural districts an extremely desirable matter. Each vehicle forming the train has perfect steering by the driver, enabling the whole train to turn any corner—as has been amply proved in the trial trips of last week. The driving power is transmitted to each vehicle by means of a jointed rotating shaft running through the train, while the

latter by a fan formed in the flywheel. The lubrication of the engine is effected by a pump which forces oil to all the main bearings and connecting rods. The clutch is of the Hele-Shaw multiple disc type, and the gear-box, which is gate controlled, gives three speeds forward and a reverse, with direct drive on top through a cardan shaft and bevel gear to the rear live axle. The universal joints are of a special design and are provided with grease cups. A useful feature is seen in the fitting of lubricators to all the different joints. The steering gear is also on novel lines, it being so arranged that any wear can readily be taken up. The steering arms, gear-box, and back axle are all provided with ball-bearings. The car has a wheel base of 9 ft. 3 in., on which a roomy side-entrance double phaeton or landaulet body can be fitted.

Fig. 38.—Plan of Chassis of Ader 16-20-h.p. Car.

compensating levers on each axle enable the vehicle to surmount obstacles and ensure equality of distribution in the load. The DAIMLER COMPANY have secured the manufacturing rights for all the world, with the exception of France, where the train originated, and we are likely to hear much of the idea during the next few months.

The Miesse Petrol Car.

A new Belgian-built petrol car is the Miesse, which made its first public appearance in this country on the stand of the MIESSE PETROL CAR SYNDICATE, LTD., of Pelham Street, South Kensington, S.W. It is of 20-24-h.p., and while following in general design the ordinary lines of live axle vehicles, an inspection showed that it comprised many

The Ader Car.

Messrs. J. C. LYELL AND Co. occupied two stands, that in the Great Hall being devoted to a chassis of the Ader 16-20-h.p. car, a French-built vehicle, which has not hitherto been prominent in England, although it has an excellent reputation across the Channel. The motor has the cylinders (92 mm. bore by 110 mm. stroke) all cast separately, a bearing being provided between each throw of the crank shaft. The base chamber is not furnished with arms in the usual way, but it is provided with a lip on each side, and extending the whole length of the motor, by means of which the latter is supported on the pressed steel frame. The lip also forms a platform on which the pump, magneto, carburettor, &c.,

are mounted. Both foot and hand control of the throttle is available, while in addition the clutch and brake pedals, as also the hand brake lever, are so coupled up that as the clutch is withdrawn or the brakes applied the speed of the engine is automatically cut down. Ignition is by high-tension magneto, with accumulators and coil as a reserve. Universally-jointed shafts connect the leather-faced cone clutch with the gear-box, and the latter with the differential shaft, this being placed well to the rear in order to give a short chain-drive.

Fig. 39.—The New Leader Car with Special Front Mudguards.

The New Leader Cars.

The HIGH HOLBORN MOTOR AGENCY were present with a 10-12-h.p. New Leader car fitted with a neatly designed two-seated body. The motive power is supplied by an engine comprising four separate cylinders, 90 mm. bore by 90 mm. stroke; the valves are operated off a single cam shaft, and the water circulation is on the thermo-syphon system. The transmission is through a leather clutch, three-speed gear-box, cardan shaft and bevel gear to a live axle. The gear-box is provided with roller bearings and ball thrusts; the dashboard is of a special curved type, forming the petrol and oil tanks, and carrying the coil and sight feed lubricators; this arrangement insures a constant supply of petrol to the carburettor when ascending steep gradients. Fig. 39 depicts the 18-22-h.p. two-seated Victoria, with hood and front glass screen, that was also on view. This is on similar lines to the vehicle described above, a noticeable feature being the special form of the front mudguards, which extend vertically from the frame at the side of the wheels as well as over the latter.

Darracq Cars.

Several of the well-known Darracq cars were exhibited by Messrs. H. E. HALL AND CO., of Tonbridge, fitted with bodies of other construction. Among the vehicles on view were a 20-32-h.p. double landaulet, a double phaeton of similar power, and a 30-40-h.p. side-entrance double phaeton. Messrs. Hall are now devoting considerable attention to body-building, and, to show the quality of the work, displayed two landaulet bodies in the rough as well as one or two finished specimens.

The Rex Motor-cycle.

In addition to a number of the Rex single and twin cylinder motor-cycles, the REX MOTOR MANUFACTURING COMPANY, LTD., of Coventry, exhibited for the first time a new tri-car, to which they have given the name of Rex Lightette. This is fitted with a 6-h.p. two-cylinder motor, the water cooling being on the thermo-syphon principle, and the ignition by magneto. The power is transmitted by a Roc clutch, two-speed gear and a single chain to the rear wheel, which is of the Rex Company's twin-tyre type.

Motor-bus and Lorry Chassis.

Several chassis suitable for motor-buses or lorries were shown by the INTERNATIONAL MOTOR TRAFFIC SYNDICATE, these including a 3-ton vehicle fitted with a 36-h.p. four-cylinder engine, gate-controlled change-speed gear and chain drive; a 20-24-h.p. 2½-ton machine, and one of 2 tons capacity. The vehicles are of continental make and appear to be of sound construction.

The Clyde Cars.

Several examples of the Clyde cars, made by Mr. G. H. WAIT, of Leicester, were exhibited by the London agents, the CENTURY MOTOR COMPANY, LTD., Willesden Junction, among them being a 8-10-h.p. doctor's car with two-seated body. While the general design

is unaltered, several improvements have been made in the details with the view of keeping the vehicles well up-to-date and of giving them a pleasing appearance; thus we note that push pedals have been adopted as well as "gate" control, and that a Daimler type of curved dashboard is now fitted. The engine, which is a double-cylinder White and Poppe, is arranged with its crank shaft parallel to the axles, it being thus fixed at right angles to the usual position. The transmission on the Clyde cars is on novel lines, and that it is efficient is demonstrated by the success achieved in several hill-climbing competitions held last year. The change-speed gear is enclosed in a box, which also surrounds a differential on the rear live axle; it is adapted to give three speeds forward and a reverse. The pinions are always in mesh, one set being loosely mounted together with the dog clutches, by means of which they are made to transmit the power, on a short shaft carried parallel to the rear axle. The latter carries the fixed train of pinions, the usual gear-box side shaft being thus dispensed with. The connection between the engine at one end of the tubular frame and the gear-box at the other is by an enclosed Renold silent chain. The clutch, which is of the metal-to-metal type, is located within the chain wheel on the outer end of the gear-box. Other Clyde cars on view included a 12-14-h.p. vehicle with a White and Poppe three-cylinder engine, and a 20-24-h.p. side-entrance double-phaeton with Aster four-cylinder motor and both accumulator and magneto ignition. The transmission in both these machines is similar to that in the 8-10-h.p. vehicle alluded to above.

The "Malcolm" Six-cylinder Car.

What proved one of the novelties of the Show was the chassis of the Malcolm 18-h.p. six-cylinder car, exhibited by the Yukon Motor Company, of Balham, S.W., it being the cheapest vehicle of the kind that has so far been put on the market. The engine and gear-box are supported on a subsidiary frame, the main one being of pressed steel narrowed at the front to increase the lock of the steering wheels. The motor comprises six separately-cast cylinders 80 mm. bore by 110 mm. stroke with the valves arranged on opposite sides. A bearing is provided between each throw of the crank shaft, while the base chamber is built up in three parts, the lower one of which can be detached without in any way disturbing the bearings. The ignition is by a coil and accumulators with synchronised high tension distributor. The carburettor is of the firm's own design and it is provided with the Krebs automatic extra inlet and a piston throttle. The water circulation is maintained by a gear-driven pump located in an accessible position below the floor-board and a Mercedes type of radiator. A Hele-Shaw multiple disc clutch transmits the power to a three speed and reverse gear-box, the final drive from the differential shaft being by side chains. In conjunction with the clutch a clutch-stop which takes the form of two small metal cones is provided. Ball bearings are fitted to the shafts in the gear-box and to the road wheels. The wheel base is 9 ft. 3 in., which enables a roomy side entrance body to be fitted to the chassis. Notwithstanding its low price the vehicle, so far as can be judged from a cursory inspection, is soundly constructed, and, as showing the interest taken in it, Mr. Brookes, of the Yukon Company, informed us that he had over 600 enquiries for it during the course of the Show.

Fig. 40.—The Malcolm Six-Cylinder Engine.

The "Belmont" Non-Skid.

The "Belmont" non-skidding tyre protector was exhibited by the BELMONT TYRE PROTECTOR COMPANY. This consists of a band of a special fibrous material, fitted by a wire to the wheels and securing a firm grip on the road surface, preventing all danger of skidding. It is claimed that it will not fray or stretch, and that there is no risk of its creeping when in use. Lightness, durability and evenness of wear are among the advantages of this new type of non-skid, which attracted considerable notice from motorists during the last days of the Show.

MISCELLANEOUS EXHIBITS.

The Davis Paraffin Carburettor.

In view of the ever-increasing cost of petrol, special interest attaches to any new ideas with regard to carburetting or vaporising devices to enable paraffin to be successfully utilised as a fuel for internal combustion engines. We give herewith in Fig. 41 two sectional views of the carburettor which Mr. F. R. Davis, of Shawford, Winchester, has recently introduced, and which was shown on the stand of Messrs. MANN and OVERTONS, LTD., at the Cordingley show last week. Generally

Fig. 41.—Sectional Views of Davis Paraffin Carburettor.

| H. Petrol Jet. | |

speaking the device consists of a cylindrical mixing chamber enveloped by a heating jacket; within this chamber is a fan revolving at a high speed on a hollow spindle driven externally by a pulley or gear-wheel. To start the engine it is necessary to use a small amount of petrol, supplied from an auxiliary tank; only a very few moments are required for the mixing chamber to become heated, when the petrol supply can be cut off and paraffin substituted by means of a Bowden control from the dashboard. The heated jacket vapourises the paraffin, and the revolving fan completely atomises it and forces the charge into the cylinders. The heating of the jacket is claimed to be unusually efficient, as practically the whole of the exhaust from two cylinders alternately passes through it, consequently the heating is rapidly effected, and the amount of petrol required is infinitesimal. The revolving fan not only causes the atomisation of the paraffin, but also draws in a supply of air, and thoroughly mixes it with the vapour, and by its natural action forces the mixture into the cylinders. Consequently, as the supply of mixture to the explosion chamber does not depend on the suction of the engine, each cylinder is sure of receiving its full charge. The regulation of the supply of air is effected by a sliding throttle through a sensitive governor; it can also be regulated either by a hand or foot lever or both.

Body Work.

Some excellent examples of motor carriage work were to be seen at the stand of Mr. W. VINCENT. We first noticed a little two-seated coupé for a doctor's use, the steering wheel and levers being entirely under cover. Another interesting piece of work was seen in a seven-seated limousine, painted yellow with black mouldings, and upholstered in French grey cloth. Other exhibits which show the variety of Mr. Vincent's productions comprised a double landaulet, a single landaulet, and a three-quarter landaulet. Mr. Vincent is just completing a very large addition to his establishment at Castle Street, Reading, the new building, which comprises two floors with lift, having accommodation for close upon fifty cars.

The Stepney Spare Wheel.

During the last few seasons the Stepney Spare Motor Wheel has steadily gained in favour and more than 12,000 are now in service. It was shown at the Exhibition by the STEPNEY SPARE MOTOR WHEEL, LTD., who are in a position to give early delivery for the coming season—a point of interest to those whose motoring days are now beginning.

As is generally known, it is a device to forestall tyre troubles, and can be easily fixed on the iron flange or bead of the wheel when the tyre is disabled. By simply screwing up two fly-nuts the wheel is made secure and the motorist is thus enabled to continue his journey, the tyre being repaired at leisure on his return home. Delays on the road are consequently rendered a thing of the past by the adoption of the wheel, which is suitable for all artillery or wire wheels. When on the car the spare wheel is fastened to the side near the driver by means of ring carriers and brackets, being clamped to the ring in the same way that it is attached to the road wheel when in service. The Stepney Spare Wheel has attained such a degree of popularity that we may expect to see it fitted on a goodly number of cars on the roads this season.

The "Ideal" Motor Screen.

Mr. T. H. GILL devoted his space at the Exhibition to showing the Ideal wind screen—a well-made and finished addition to the car. This is constructed with one or more movable parts, and so arranged that the top and bottom halves can be set at any desired angle. Spiral springs inside the uprights keep the top frame in position and secure a practically tight joint between the bottom and top halves, in whatever position they happen to be. The screen is made of brass with grooved rubber for holding the glass in position, and the facility with which the device was operated at the show gave every assurance as to the ample protection it provides for wind, dust and rain. Mr. Gill has had considerable experience in motor body work and has designed some good types of landaulet and Roi des Belges bodies.

The Wicksteed Change-speed Gear.

Considerable interest was shown in the new change-speed gear, shown fitted to a 15-h.p. Humber car by Messrs. CHARLES WICKSTEED AND CO., LTD., Kettering, who have been at work at it for more than a year past. Some particulars of the arrangement have already been given in the *M.C.J.*, but it may be mentioned that the gear is of the type in which the various pinions are always in mesh, the requisite pair being made to drive by means of metal cone clutches. As will be seen from Fig. 42, the two shafts are not only parallel, but in the same horizontal plane. Running the whole length of one side of the gear-box is a miniature crank shaft to which small connecting rods are attached. The opposite ends of the latter are fixed to discs formed in one with the male portions of the clutches. These are carried in special screw-threaded supports, corresponding threads being formed on the body of the clutch. Only a slight movement is required to engage or disengage the clutches, this being obtained by the arms and the screw threads just referred to. The side shaft is only brought into use for the first, second, and reverse speeds, the top one being a direct-drive. The gear is controlled by a small hand wheel working above a dial plate on the top of a vertical column at the side of the steering pillar. The dial is lettered in the following order: Neutral, low, middle and fast speeds; and as the wheel can be turned in any direction or continuously one way, the gear can be changed with a minimum of trouble, without it being necessary to with

Fig. 42.—Sectional Plan View of the Wicksteed Change Speed Gear.

draw the main clutch. The reverse is operated by a separate small lever on the vertical column, the gear having first to be put in the neutral position. The gear runs very quietly, and is simply operated, the action being such that there is no danger of straining the engine or mechanism in changing speed, while the trouble of stripped gears is entirely obviated. We understand that it is being fitted to quite a number of pleasure cars, and that it is now being experimentally tried on one of the motor-buses in London.

The "Heron" Tyre Pump.

A thoroughly substantial device for automatically inflating motor-car tyres by utilising the power of the engine was shown on Mr. J. A. RYLEY's stand by the HERON MOTOR CO., LTD., of Birmingham. The makers point out that the "Heron" pump can be fitted to any car, and that it saves labour in pumping up tyres. It will pump up to 300 lbs. pressure, and the general arrangement will be evident from the accompanying illustration (Fig. 43). The pump is bolted to the frame of the car and is worked by a cardan propeller shaft connected with a friction wheel held in contact with the engine fly-wheel. The cardan shaft can, of course, be made of any length to be adaptable to any particular

Fig. 43.—The Heron Tyre Pump.

vehicle. The necessary reduction in speed is obtained by a worm-driven wheel with ball thrust bearings mounted in the pump casing. The "Heron" patent piston compresses the air, and the oil is prevented from passing into the tyres by a very ingenious packing. The installation is completed by the air reservoir fitted with pressure gauge and a relief cock with the necessary length of flexible tubing to reach all the four tyres.

Screw-Making Machinery.

A new automatic screw-making machine formed the interesting exhibit of Herr GEORG WUTTIG, of Lobtau, Dresden, Germany, represented in this country by Messrs. Beckenbach and Company, Bradford. The tool, the special feature of which is the arrangement for cutting the threads without reversing, is capable of turning out up to eighteen screws per minute, or 8,000 per diem. Whilst in all former screw-making machines the movements of the working spindle and cutter had to be frequently reversed for the purpose of cutting threads, this is no longer necessary in the new machine, in which the spindle and cutter run uninterruptedly in the same direction. This new construction possesses a great advantage in that in cutting threads the movement of the working spindle need never be reversed nor arrested and in that the shaping steels can uninterruptedly work simultaneously to the cutter. The threads can thus be cut simultaneously to the making of the pivots or cutting off, without any necessity for this work to be done separately. The high efficiency resulting therefrom will be easily perceived.

Component Parts.

Some of the finest engineering work in the Gallery was to be seen on the stand of Messrs. H. and G. KINGSTONE AND CO., whose works in North London are well equipped for the provision of high-grade component parts for automobiles. Judging from the interest taken in the stand by experts, the firm should quickly reap the harvest of their enterprise in being represented at the Show. A good piece of work was the gear-box on the stand. This had three speeds forward, with direct drive on top speed, and one reverse, all actuated by one lever. The gear wheels are turned from the solid bar, and are case-hardened by Messrs. H. G. Kingstone and Co.'s special process, which prevents crystallisation from taking place, thus adding to the durability of the wheels. The shafts and counter shafts are of 4 per cent. nickel steel. The gear cases are despatched with sprag ratchet wheel and one pair of universal joints. We also noticed a good type of back axle designed for cars up to 35-h.p. In this the entire weight of the car is carried on the outer sleeve, which have four rows of ball bearings and four ball thrust bearings. Power is transmitted to the driving wheels by the live axle, which has no weight to carry. These back axles are fitted with specially constructed brake drums, with cooling space between the inner and outer friction surfaces, which thus permit the use of two brakes on the same drum, one brake being of the inside expansion type, and the other of the outside contraction type. Both brakes, as fitted, are double acting. The differential case is carried in two separate bearings, preventing any side strain on the driving axle. Various other component parts were shown by Messrs. Kingstone and Co., all of the same high grade of engineering work.

Bodies for Delivery.

Messrs. W. PARKYN AND SONS, LTD., whose reputation in the carriage-building industry extends over half a century, are paying special attention to the requirements of the automobile trade, and their exhibits were of considerable merit. The van bodies shown were designed for commercial vehicles, one being built to the order of Messrs. J. Shoolbred and Company, for parcels and furniture delivery, and the other intended for general trade purposes.

"Shock-shifter Hub."

The stand occupied by Messrs. JOHN MUIR AND SON was of particular concern to those associated with the heavy motor industry. Examples of their pigskin tyres were on view in both new and old condition, the comparison illustrating the good wearing qualities of this special material, in the tanning of which the firm's long experience is a valuable factor. The firm also exhibited a new hub to prevent road shocks reaching the axles. This is of simple construction and has excited the interest of those responsible for the conduct of public motor services in marked degree. This "Shock-Shifter Hub" is filled with steel balls, loosely packed, supporting the axle. The weight of the axle carrying the vehicle automatically forms a vacant space, which is constantly maintained whilst the wheel is in movement. Owing to the mobile condition of those balls, resting on one another, always in angular position, ever ready to slip over each other, and revolving on their own axes, an all but liquid bearing to the axle is given. Immediately, therefore, any road shock, however slight, takes place, the row beneath the axle, and to its full width of six or eight balls is immediately displaced. This row is forced across the vacant space, followed by the other balls, thus causing the shock to pass into the ball chamber in the backward moving half of the wheel, wherein the line of its transmission must be constantly broken up. The road shock is thus absorbed and prevented from ever reaching the axle. The movement of the car is said to be very steady, because there is no reactionary shock on this wheel.

Insurance.

The various schemes of motor-car insurance found ample explanation at stands occupied by some leading companies and by Col. D. A. Kinloch and Mr. Guy Gold, who were affording information with regard to Lloyd's insurance policies. The Car and General Insurance Corporation, Ltd., and the General Accident Assurance Corporation, Ltd., occupied stands in the Gallery, where information as to their policies could be obtained.

The Simplex Shock Absorber.

Fig. 44 depicts the new shock absorber which is being introduced by the SIMPLEX SHOCK ABSORBER SYNDICATE, LTD., and which was shown fitted to all four springs of a large four-cylinder car, which has recently been submitted to extensive trials. The device, which, as will be seen, is interposed between the axle and the carriage spring, consists of two metal boxes working one within the other, the spring being attached to the outer one and the axle to the inner. Between the two is held a pneumatic cushion, consisting of an oblong-shaped rubber bag enclosed in a canvas cover and fitted with an ordinary cycle tyre valve, enabling it to be pumped up to a pressure of 10 lbs. per square inch. Between the sides of the box are fixed steel friction rollers, which act as guides. Although there is little danger of the cushion becoming deflated, provision

Fig. 44.—The Simplex Shock Absorber in position.

is made whereby it can easily be withdrawn and a new one inserted. In the trials that have been made, the device has been found not only to reduce the amount of vibration due to road shocks transmitted to the passengers, but also that it saves the engine and transmission mechanism from undue jolting. As will be seen, the absorbers slightly raise the height of the vehicle from the ground, but the inventor informs us that, rather than this being a drawback, he has found it a distinct advantage, inasmuch as it has distinctly reduced the dust-raising proclivities of the car. The arrangement is an interesting departure and one which is well worthy of attention.

Scott's Non-Skid.

On the stand of Sharpe's Patents Company, the TYRE REPAIRING COMPANY, 2, Wilmington Street, Margaret Street, Farringdon Road, E.C., showed a new non-skid, introduced by Mr. A. H. Scott. The feature of this is the alternation of rubber and metal studs forming a non-skidding surface while retaining the resiliency of the tyre. The idea seems a good one, and we await its appearance on a car with considerable interest. The rubber treads are somewhat deeper than those of metal, so that the rubber is always being compressed and the two materials secure a good grip on the road surface.

Electric Horns.

The new taximeter and motor-bus speed indicator introduced by Messrs. S. SMITH and SON, LTD., and recently mentioned in our columns, attracted attention to the stand occupied by this well-known firm of speedometer makers. Their speed indicator has been introduced into the United States and Canada with very gratifying results. Their milometers are recommended as reliable up to 10,000 miles and showing the running in miles and also in tenths of mile. Motor watches, communicators in various designs, roof lights, and various electrical fittings for vehicles and other specialities were shown, including the new "Grack" horn.

Fig. 45.

This can be used with four or eight volt accumulator, and emits a loud penetrating sound on the button being pressed. The push box is strapped on the steering wheel, and the simplicity of the horn should commend itself to those who are dispensing with the ordinary form of bulb horn.

The "Victoria" Spring Wheel.

Among the late comers at the Show was the VICTORIA SPRING WHEEL SYNDICATE, of Queen Anne's Chambers, Broadway, Westminster, S.W. Their special exhibit was a new resilient Shock Absorbing Spring Tyre, composed of a number of elements or units which are interchangeable and can thus be refitted, should any one of them get out of order, a condition which is extremely unlikely. The invention is somewhat difficult to explain without illustrations, but we look with interest to a practical test of the tyre, which can be fitted to any existing wheel and is said to run as silent as a pneumatic tyre, meeting the puncture difficulty and securing resiliency. The Victoria Tyre was a notable addition to the accessory department at the Show.

Hoods and Vulcanisers.

Messrs. GEORGE JOHNSTON AND CO. had a good show of covering material and waterproof cloth for motor-car bodies and hoods, including "Rhinohyd," a specially prepared fabric that has proved its serviceability for hoods and in similar situations. The particular hues in which it was shown seem well adapted to maintain a good appearance under the trying and variable conditions that befall the much-used car. The floor of the stand was covered with rubber matting to demonstrate another branch of the firm's business, while all around were beading, buttons and general brasswork for Cape cart hoods and the like, for which Messrs. George Johnston and Co. supply everything that is required. At this stand there was also exhibited the "Vul tyre" vulcaniser by means of which vulcanising repairs can be executed on the inner tubes of pneumatic tyres by the "dry heat" process. The operation is extremely simple. The tube surrounding the puncture is cleaned; the special solution spread over the cleaned surface; the prepared patch, which in itself contains the vulcanising chemicals, is placed over the puncture, and it is then ready for vulcanising. The iron block is heated and placed in position, when fifteen minutes completes the process, and the resultant repair is an amalgamation with the original tube. Cohesion of every part takes place, filling up the tear or puncture.

Lubricants.

Messrs. PRICE'S PATENT CANDLE COMPANY, LTD., had their usual good display of lubricants for motor-cars and the component parts of the same. These have so recently been referred to in our columns that extended reference is unnecessary on the present occasion, but we may recall the memory of our readers to "Belmoline" for gear boxes, "Cirogene" for chains, "Curroleum" for leather faced clutches, and "Manulav" for cleaning the hands of motorists, &c.

The Cave Rim and Albany Pump.

The Cave detachable rim was on exhibition at the 1906 show, since when it has been fitted on cars for the Queen, the Prince of Wales, the Duke of Portland and other eminent persons as well as enthusiastic motorists. Further testimony of its value is afforded by the fact that it will be fitted to the three Italian built Daimlers entered for the Targa Florio race on Sunday next. The ALBANY ENGINEERING COMPANY have now become the sole concessionaires for this "quick-change" rim, which

can be remounted in five minutes. The form of the rim has become well known, so that the briefest description will now suffice. A thin rolled steel bonding band is shrunk around the outer circumference of the felloes and a pressed steel flange is fixed on the car side of the wheel. The rim, of any standard make, is then taken and is slipped on to the bonding band laterally, tight up against the flange. A second flange is placed on the outer face of the felloes, and horizontal bolts, tightly screwed up, make the flanges grip the felloes and rim securely. In the security bolts lies the radical departure from the usual custom. The head of the bolt is detachable from the stem. The bolt stem is of the standard type, but is being made to be detached from the rubber covered head by means of a pneumatic joint which combines the strength of the screw with the ease of manipulation of a bayonet joint. Three of these security bolts, equally divided, are used in each tyre, entirely eliminating all possibility of tyre creeping. The well-known "Albany" motor-car circulating pump was the other speciality at this stand. This is an absolute force pump which can be bolted direct to the frame. It is positive in action and delivers a full stream. There are no valves, and, as only two working parts have to be considered, the wear is reduced to a minimum. Slips and leakage have been entirely eliminated by the introduction of groove cuts along the face and edges of the teeth, so that in rotating a body of water lodges in the grooves, forming an absolute sealed water-tight joint or cushion between the casing and the rotating rollers, thereby producing an efficient vacuum. Centrifugal force also adds to the efficiency of the pump.

The Gratz Specialities.

The GRATZ PATENTS AND ENGINEERING SYNDICATE, LTD., who have attained distinction in connection with the speed indicator here illustrated (Fig. 46) made an extensive display of electrical specialities, many of which were working in order to demonstrate their merits to visitors. Among the special instruments at the stand was the Gratz tyre pressure tester, by means of which tyres may be tested without the motorist having the trouble to fix his pump every time. The cap is simply screwed over the valve and on pressing the plunger the tyre pressure is indicated immediately. Should it then be found that the pressure is below what is necessary, it is only required to screw the end of the tube from the pump on to the nipple at the base of the gauge and pump up to the required pressure. Attention may also be drawn to the Gratz synchronised distributor, every part of which is open to inspection without the trouble of unscrewing covers, &c. The pressure on our space prevents a description of the apparatus being given in the present issue, but we may mention that it secures the same intensity of spark in each cylinder, thereby increasing the efficiency of the engine. The apparatus bears evidence of sound construction. Two inches of the

Fig. 46.—The Gratz Speed Indicator.

steel central spindle are left protruding to facilitate coupling, or, if required, special attachments can be supplied. An exhaust cut-out, a spark-detector for fitting to the dashboard, and an electric motor horn were among the other specialities on the stand. The Gratz horn is of exceedingly neat appearance, and it is only necessary to press the button of the switch to blow the instrument. The buzzer can be supplied separately and is screwed on to any existing trumpet. It is connected to one terminal of a 4-volt accumulator by the single wire; the other terminal is connected to the switch, so that on pressing the same the circuit is completed through the frame of the car—a saving of superfluous wiring. Gratz Patents, Ltd., first came into prominence with their speed indicator and mileage recorder, in which simplicity of construction and accuracy of operation are combined with a durability that has placed their instrument in the forefront of such devices.

The Durandal Non-skid.

Messrs. STUART MORRISON AND COMPANY showed the Durandal detachable non-skid and protector bands, which have long passed the experimental stage, having stood the test of five years' use in France and England. The accompanying illustrations (Figs. 47 and 48) give a good idea of the device, which can be fitted to worn covers as well as to new ones. To fit the band all that is necessary is to jack the wheel, deflate the tyre and insert the metal clips shown on the edge of the band in the rim. The clips should be placed so that they are equidistant from each other and the tyre inflated in the ordinary way. A point of interest in

Figs. 47 and 48.

connection with the band is that it can be repaired, relined and fitted with new treads, so that economy as well as efficiency has been amply provided for in the construction of the Durandal non-skid. The Durandal gaiters embody the same principle as the band, clipping into the rim and entirely obviating the use of wire or laces.

The "Eyre" Anti-skid.

Among the non-skids shown was that known as the "Eyre"—the production of Messrs. EYRE, of St. Leonards-on-Sea. This has distinct advantages in being always ready for use and capable of being put in or out of action in a few seconds. Without impairing the resiliency of the tyre, the non-skid is effective on all slippery surfaces, and its effectiveness in frosty weather has been as pronounced as at other times. The bands or loops constituting the device do not encircle the tyre, but are secured to the spokes of the wheel by clips. They travel in a parallel line with the course of the wheel, so that when a side-slip takes place, the wheel, having a lateral motion, slides on to or mounts one or more of the loops, as each loop, when at its lowest level, presses the ground close to the side of the tyre. The material used for the loops is twisted steel cable of considerable strength, and is covered with a spirally-wound casing of wire. Should this casing, after some use, show signs of wear at any part, sufficient to expose the steel cable, the portion affected may be removed and a new piece of wire bound on in its place. This repair can easily be effected in a few minutes. When in action the loops and spokes have very little strain to withstand, and experience has given proof of its efficiency. A new type of loop was also on view, this being made from Italian hemp cable, tarred and bound with an outer covering of galvanised wire, ensuring the durability of the device.

Optima Non-skid.

The OPTIMA TYRE COMPANY made a feature of their non-skid, the special claim on behalf of which consists of the quality of the leather employed in its production. In addition to being a non-skid, the Optima device is also a protector of the tyre. The leather is cowhide, and by a patent process the protection of the animal's hair is retained. Hardened steel studs are fitted in the tread, the leather intervening between the tread and the cover being indented so that the ends of the rivets fit securely and give rise to no friction. In addition to retaining its soft and pliable nature, the tread can be recommended on the ground of durability, and we may also mention that the OPTIMA TYRE COMPANY undertake the repair of tyres and are prepared to advise motorists on all matters concerned with tyres.

A Pneumatic and Rack Jack.

At the stand of the PARSON'S NON-SKID COMPANY Warren's pneumatic and rack jack was shown—an ingenious arrangement obviating many of the disadvantages associated with the ordinary form of jack, and possessing merits of its own. The jack consists of a cylinder with a rack, and is connected by tubing to a pump operated in the same way as an ordinary tyre pump. To jack up the car all that is necessary is to slide the spring to the top of the pawl and place the apparatus in position. The jack is then connected to the pump, which is worked in the ordinary way until the car is sufficiently raised. To lower the apparatus it is merely necessary to slide the spring to the bottom of the pawl and pump again till the pawl

automatically disengages. The pump can then be disconnected. The fact that it is essential to pump in order to lower the jack constitutes a safeguard against interference from unauthorised persons. The demonstration which took place at the stand convinced visitors of the excellence of the idea, while the fact that it can be operated from the upright position and at any distance from the object to be raised is a decided relief to those who have had experience of aching backs occasioned by the usual methods. The maker comes from Ipswich, his address being 95, London Road.

Body Work.

Among the exhibitors of bodies for motor-cars were Messrs. BAYLEY AND ELLIS, of Dalling Road, Hammersmith. Those on view comprised a side-entrance double phaeton and a landaulet; these are constructed throughout of wood, the special curves being a noteworthy feature of the design.

Motor Specialities.

A comprehensive exhibit was made by Mr. J. A. RYLEY, of Birmingham, whose electric specialities are well and favourably known. The display included accumulators, contact makers, H.T. distributors, electric indicators, jacks, sparking plugs, voltmeters, &c., as well as a dozen other accessories of importance to the motorist. Among these were the Sthenos carburettor and a new form of "Vita" plug intended for use with high tension magneto. Mr. Ryley's new catalogue of motor specialities for 1907 was issued from the stand—a neat list of forty pages, which will be sent on application to 23½, Martineau Street, Birmingham.

Goggles, etc.

One of the largest exhibits of lamps and other accessories was that made by the GOLDSCHMIDT MOTOR ACCESSORIES, LTD., whose many good agencies give them every opportunity for meeting the requirements of motorists of every degree. Their display included head lights, side lamps, tail lamps, &c., motor horns, plugs, voltmeters, &c., and "La Steno" goggle, which possesses many decided advantages over the ordinary form of goggle. Such accidents as that which recently befel Mr. Rothschild while motoring in the Midlands would be impossible by the universal use of "La Steno."

Wind Screen.

The Gordon double folding wind screen was on view on the stand of Messrs. Trier and Martin, Ltd. It is the production of the GORDON MOTOR BODY WORKS, and considerable thought has evidently been given to the design and construction of this screen, which can be folded at no less than six different angles. It gives absolute protection from the weather at any and every position, and in mist or rain can be so regulated as to permit a clear view in front and giving a clear view at the same time. This is a most important consideration, the value of

Fig. 49.—The "Gordon" Wind Shield.

which will be apparent to those who have had any knowledge of the accidents that may be caused by screens becoming obscured by rain. Our illustration shows the screen in use, with the top half folded inwards to minimise the wind resistance and give the driver the uninterrupted view ahead during rainy weather. The revolving upper portion always overhangs the lower half, securing the protection of the driver. The ingenious construction of the device is a feature that has secured its adoption by some of the leading motor-car makers, and the designers are to be congratulated on making such a creditable *début*.

Motor Tools.

Messrs. AVEY AND ROBERTS, LTD., had a collection of neat tools, including the Auto-adjustable Box Spanner already eulogised in our columns, and which is illustrated herewith. This can be instantly adjusted to fit a nut of any size or shape, taking the place of many tools, and so economising space. No damage is done to the nuts, as the jaws fit perfectly, and the handle being adjustable facilitates the use of the tool in inaccessible places. The Auto Nut-pliers, combining nut-pliers, wire cutter, and nippers, burner hole, and ordinary pliers and the Auto-vice were also shown. This is intended for roadside and garage repair work, and can be fixed to any gate, bar, or fence, leaving the hands free for work. The Auto valve remover and

Fig. 50.—The Auto-Adjustable Box Spanner.

spring terminals were also on view, while attention may well be drawn to the "Tourist's" tool kit, which has been devised by an expert, and contains all the tools usually required on the road, including all the special patent tools of Messrs. Avey and Roberts, Ltd. This has adjustable straps to fit tools of any size, and is made of the best hide.

Tank Filler.

In previous issues reference has been made to the excellent tank filler placed upon the market by PETTETT'S PATENT SAFETY FILLER COMPANY, LTD. This was again shown at the Exhibition, and its features are so well known that here it will suffice to briefly set forth its merits. The Combination Safety Motor Filler is adaptable to all motor spirit cans and prevents the waste of spirit while also reducing the possibilities of fire. Awkward tanks can easily be filled by its means without the use of a funnel. The spirit has to pass through a wire gauze of fine mesh, thus preventing the ingress of foreign matter into the tank to be filled. Another speciality is Pettett's patent combination funnel, can and filler, known as "the Dripless," the adoption of which enables the funnel to be dispensed with while securing the filling of any tank or metal container without the risk of overfilling.

Travelling Coat.

Mr. E. SMEE devoted his space to showing the patent motor and travelling coat that he has been popularising during the last few months. The position of Mr. Smees in the tailoring world may be regarded as a guarantee of the stylish appearance of the special garment associated with his name, while its wind and water resisting properties are easily seen. The coat gives warmth without weight, secures protection where most needed, and provides sportsmen with a serviceable garment for motoring, fishing, yachting, and other sporting purposes.

Selvyl.

For keeping in good appearance motor-cars and their accessories, the qualities of SELVYT are generally recognised, its peculiar texture giving it special merits in this connection. The polishing cloths are of a size adapted for general cleaning and polishing work. Selvyl is also utilised for gloves, aprons, lamp glass chimney sweeps, motor lamp covers, spare tyre covers, &c. One quality peculiar to this material is that after the car has been hosed and sponged, any grease that may remain will be absorbed by Selvyl, leaving a bright glistening surface on the paint work—in contrast to the action of many cloths that were employed before the general use of Selvyl.

Motor Lawn Mowers.

The motor lawn mowers introduced by Messrs. RANSOMES, SIMS AND JEFFRIES, LTD., continue to find favour, and a large number are in service in the Colonies as well as in the old country. At the Show the lawn mowers were shown in the three sizes, viz., 42 in., 30 in., and 24 in., the motors being of 8-h.p., 4-h.p., and 2½-h.p. respectively. Messrs. Ransomes are now building their own petrol engines, and had on view four sizes, 2½-h.p. air-cooled, 4½-h.p. and 8-h.p. single-cylinder, and 12-h.p. double-cylinder, the bore and stroke of the latter being 4½ in. by 5½ in. The valves are mechanically actuated off a single cam-shaft and the ignition is by high tension magneto.

The Automobile Association.

The Automobile Association were well to the fore at the Exhibition. At Stand No. 158 the Association's energetic secretary and some of the leading members of the staff were in attendance to answer inquiries. The well-known Automobile Association map, on which are displayed the whereabouts of agents, patrols and other important information, was on view, and the stall was easily recognised by means of a large model of the Automobile Association car badge. Members found it a convenience to have messages left and to make appointments at the stand; while the result of the enterprise has been a good accession to the ranks.

Fitted to the cars exhibited at the show were 234 Dunlop tyres, the remainder, we are informed by the company, being divided among tyres of twenty-two different makes.

MILLENNIUM LTD. had a collection of miscellaneous articles required by motorists, such as cotton waste, motor oil; grease and the B.S.T. carbide, as well as a number of other specialities familiar to our readers.

Messrs. J. J. LANE, LTD., of Cranbrook Street, Old Ford, E., showed the Eland pump, an invention for moving economically large bodies of water. It was shown in operation, and its remarkably silent running was a distinguishing feature.

Elastes was represented at the stand occupied by the company of that name, this, as our readers know, being a filling for tyres which secures their life while not reducing their resiliency. The preparation is calculated to overcome the puncture difficulty.

Messrs. F. B. HILL AND CO. had an assortment of their fire extinguishers, suitable for all purposes, as well as of fire grenades and buckets. The firm have made a close study of the subject of fire extinction, and have assured much success in this particular line of business.

The "Favourite" chemical fire extinguishers were shown by Messrs. SINCLAIR AND CO. These are made in various sizes from one to five gallons, and have already proved their value in extinguishing fires on cars and in garages. A collection of hand grenades was also on view.

The IMPERIAL MOTOR INDUSTRIES had an exhibition of their specialities on one of the stands. These included the Supremus plug tester, providing a simple means of cutting out any cylinder on the engine by merely pressing the insulated knob until the point is in contact with the "earth base" of the plug.

Messrs. WEINBRENNER AND CO. had a collection of chemically engraved name-plates for the motor-car trade. The firm have come into great distinction with their plates for footsteps, radiators, axle caps and dash-boards, as might be gleaned by the names of several leading manufacturers shown on their stand.

Messrs. SAMUEL BROS., LTD., showed motor clothing for motorists and liveries and uniforms for chauffeurs, &c. The feature of the display made by these well-known tailors was the Omne Tempus cloth—a rain-resisting cloth that is largely employed in the raincoats prepared by Messrs. Samuel Bros. for the use of ladies and gentlemen who motor.

A large selection of Graphite motor lubricants was shown by Mr. W. G. NIXEY, on whose stand were pure flake graphite, specially fine graphite, graphite gear and cup greases, graphite pipe joint grease, etc., as well as several good qualities of lubricant. Mr. Nixey makes a point of the essentially British character of his productions, all of which are prepared in London.

The "New Era" petrol fire-extinguisher for garages, motor-omnibuses and motor-vehicles has become familiar since its introduction by the VALOR COMPANY, LTD. This is made in several patterns and may be seen on many of the motor-buses now plying in London, while a convenient form is made for cars. It is a practical and powerful hand fire appliance.

Messrs. J. and R. OLDFIELD showed the "Dependence" Motor Lamps in various sizes and types. Lamps for garages, as well as for cars and heavy vehicles, were on view, and particular interest was taken in the electric head lamps, which are so devised as to concentrate a perfectly parallel beam of light directly in front and on the road without the objectionable dazzling glare. We give in Fig. 51 an exterior view of the lamp showing the light rays projected in a parallel beam. This light has a range of 100 yards and can be manipulated from the driver's seat without the inconvenience of dismounting. The "Dependence" electric headlight is well calculated to add to the comfort of night driving. Electric side lamps were also shown, and it should be noted that the bulb is

Fig. 51.

detachable from these lamps for the inspection of engine parts, &c. Attention may also be drawn to the electric side lamp with its segmental cone reflector so designed as to intensify the brilliancy of the light many times its normal candle-power, each segment acting as an independent reflector. Several types of tail-lamps were also shown, including one in which the electric fitting is interchangeable with a paraffin vessel, enabling either electricity or oil to be used as convenient. For burning paraffin many good designs were exhibited, a side-lamp which also gives a serviceable light for driving purposes being the Modele de Luxe, which is unaffected by vibration and gives a pure white light of great intensity, which is projected in the form of an arc. The oil reservoir is secured by the firm's patent spring locking device. We may add that Mr. C. Hooydonk, 6, Leather Lane, E.C., who is the London agent for the Dependence lamps, was in attendance throughout the week.

M. CHARLES VERMOT, for whom Mr. C. Fonteyn is the British agent, had a well-arranged stand for the display of axles and springs for motor-cars and heavy vehicles. These were of remarkably fine finish and secured the favourable notice of experts in the trade.

(To be continued.)

CORRESPONDENCE

[Letters to the Editor should be addressed to the office,
87-88, Charing Cross Road, W.C.]

MORE COMPARATIVE IGNITION TESTS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have just finished some further tests relative to the b.h.p. of a six-cylinder Napier engine with synchronised ignition, and with Eisemann magneto ignition also, with the same types of ignition but with two plugs in each cylinder. The Eisemann magneto was used because it appeared to give the greatest amount of power. The accumulator and coil system was the standard Napier synchronised. The accumulator registered 4.2 volts, and during the whole period of the tests everything except the ignition remained the same, so that no outside conditions would be allowed to vary the result.

The result of these tests appears to further confirm the fact that, providing one has a correct spark, no further power is gained by additional heat in the spark or by having ignition occurring in more than one place in the cylinder at one time. The tests were taken as follows:—The engine was first run for some time to get all

The above illustration depicts the 40-h.p. Siddeley Car at present undergoing a long-distance trial at the point where it broke the previous record for a non-stop road run. The vehicle still continues its unbroken record, having now made a total, to Saturday the 13th inst., of 4,698 miles absolute non-stop, the total distance covered in the trial being 7,610 miles. As the picture indicates, the two drivers are very jubilant over their success, as their task has been a most difficult one owing to the heavy roads and bad weather experienced since the trial started on February 15th. A "Mascot" horseshoe is, it will be observed, attached to the rear spring hanger.

the conditions up to an average as regards temperature, &c., then two minute tests were taken:—

Napier Synchronised.		Eisemann Magneto.	
1 plug.	2 plugs.	1 plug.	2 plugs.
71.74 b.h.p.	69.15 b.h.p.	68.92 b.h.p.	68.74 b.h.p.

The net result of this was to show that the synchronised ignition gave on an average some 2 to 3-h.p. more than the magneto, although on an engine that can develop over 70-h.p. I do not attach very much importance to this. The great point that the results have shown is that there is apparently no b.h.p. gained with the magneto. The point of firing was found to be later with the magneto than with the synchronised ignition to give the best power. The magneto broke circuit with the piston one-fourth of an inch previous to reaching dead centre at top stroke. The synchronised ignition was advanced to $1\frac{1}{4}$ in. from top of stroke to get the best result. It seems, therefore, on the face of it, that increased heat in the spark merely enables one to delay the point of the ignition, but does not increase the power, and the table shown above also seems to make this definite and clear. It seems to me probable that when drivers have apparently got more power

from switching on to magneto the cause has been through their accumulator system either being in bad order or faulty design.—Yours truly,
S. F. EDGE.

MAKERS' DISTINGUISHING MARKS ON CARS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Up till a year or so ago a well-informed motorist had no trouble in telling the names of nearly all cars encountered on the roads. Most of them were radically different in appearance, and even those bearing a general resemblance possessed features that enabled one to identify them without difficulty. The coming, and finally the practically universal acceptance, of the four-cylinder vertical motor has changed all this, with the result that for three years, at least, cars have been getting more and more alike externally. Perhaps as a protest against this monotony of design, and in response to a demand for individuality in detail, there is very noticeable at present a trend toward distinctive features, especially about the front of the car. Of course this usually means the radiator. Hence the appearance of radiators in a wide variety of shapes—square, round, octagonal, oblong, oval, &c. Some of these radiators have been frankly designed solely to make the car to which they belong conspicuous. There is plenty of scope for originality and for departure from traditional lines. The expected result has occurred, for nearly all of the cars referred to can be told at a glance. Nevertheless, there are many makers who have held aloof from this movement. Other considerations than the mere evolving of a distinctive radiator or bonnet have actuated their designers, and for this reason it is still difficult to distinguish, from the front view alone, quite a number of cars. It is only when they get nearer, and the eye is able to trace peculiarities of body design or other features, that identification is possible.

It is this approach to uniformity in radiator and bonnet design that is largely responsible for the tendency, to which reference was made in the last issue of the *M.C.J.*, to place on the front of the radiator some symbol, whether it be an initial or the name in full, that tells the make of the car. It occurs to me, however, to ask whether motorists want their cars labelled in such a fashion as this? Some people want publicity of this character. They do not object even if the letter is large and gaudy. The better the name of the car, the more conspicuous do such owners desire it to be. But there are others, and probably a considerably larger number, who object to going about with their cars placarded, although they have no special objections to a neat and inconspicuous name plate which will enable any one interested to tell the name of the car.—Yours truly,

DEVONIAN.

IN PRAISE OF BATH.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—When touring the country and calling at different garages one is so often treated in an off-hand and casual sort of way, that I feel I should like to place on record the extreme courtesy which I received, when in trouble during the Easter holidays, from Mr. W. Whiting Milk Street, Bath.

I planned out a tour for the holiday, and on Sunday, when about a mile the other side of Bath, my car stopped, and on examination I found it was owing to a broken pin in the magneto. While I was trying to find out where the trouble lay, Mr. Whiting came past on a car, and immediately pulled up to see if he could be of any assistance. He then towed me into his garage, and not only placed his repair shop at myself and man's disposal, but himself personally assisted me in every way he possibly could.

Should any motorist require assistance of any kind when in Bath and district, I can confidently recommend him to go to Mr. Whiting, and he would be sure of receiving both courteous and careful attention. I may mention that I have no interest in Mr. Whiting's business, this being the first time that I have ever met him.—Yours truly,

H. H. STERNEY.

VARYING PETROL CONSUMPTION.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was in hopes that my letter in your issue of the 6th inst. would evoke some information from several owners of cars. But only one, Mr. O. Carter, writes and gives the consumption of petrol for a single-cylinder 8-h.p. De Dion car at about thirty miles to the gallon. This works out at about the same relative consumption per h.p. as mine, but not nearly such a good result per h.p. as the 40-h.p. Napier car I quoted. I believe that the lower priced motor-cars are, as regards the carburettor, simply slung together, there being no attempt to obtain any real economy in petrol consumption. The makers of my car state they can run some 34½ miles to the gallon on an "official trial," but does anyone know how these "official" results are arrived at, and to what extent the cars are doctored as regards weights of individual parts, as they certainly used to be to the extent of substituting cardboard for metal in bonnets, boring holes in all parts made of metal where possible, and, in fact, artificially reducing weights in all kinds of ways. My car nominally weighs when empty about 12 cwt. In these days, when the price of petrol is so high, the smallness of its consumption is most important; and, as showing how badly cars may differ, a gentleman living near me tells me he finds his car, a single-cylinder 10-h.p., uses as

much sometimes as one gallon to sixteen to eighteen miles, and driven by a skilled driver. Is there any one form of carburettor which is more economical than another? Mine consists of a simple float feed single chamber, with one inlet from the tank, and two small apertures in the base of the float chamber leading to the two spraying chambers of the two cylinders, which are $3\frac{1}{2}$ in. diameter by $4\frac{1}{2}$ in. stroke.

I shall be glad of any suggestions which may throw light on the much smaller consumption of petrol in the Napier 40-h.p. car in proportion to its horse-power. What is the experience of anyone with a four-cylinder 14-h.p. Coventry Humber car? I mean an amateur driver.—Yours truly,

D 2804.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—For economy in fuel consumption I think the 8-h.p. De Dion engine thoroughly tuned up would be difficult to beat. I have used for pleasure only during the past three years an 8-h.p., two speeds and reverse, with tonneau and Cape hood, weight, with two children, wife and self and general sundries, 16 cwt. 3 qrs. Under ideal conditions I have driven forty-six miles to the gallon. My longest journeys have been Manchester to Scotland and back, several runs to London and back, and tours through Wales. On these runs I have regularly done forty-two miles to the gallon. These results are not dreams but actual solid fact, the tank, carburettor, and piping being drained before starting and the petrol carefully measured and mileage recorded. There is not a ball-bearing on my car, plain everywhere, so a good deal is absorbed in transmission, nevertheless I can jog along all day comfortably at eighteen miles an hour, and have never jibbed at any hill. I do not think the majority of single-cylinder owners pay sufficient attention to the condition of their valves, and compression, and the perfect tuning up of the engine with the carburettor.—Yours truly,

WM. COTSWORTH.
Assoc. M. Inst. E. E.

THE PREVENTION OF CARBON DEPOSIT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be much obliged if you or any reader of the *M.C.J.* would tell me the best way to prevent carbon deposits from forming on the cylinder heads and pistons of the engine of my car? I am careful to use the proper mixture of gas, as well as good oil, and not too much of it, but the carbon forms just the same.—Yours truly,

BERGAMO.

[Since the only possible cause of the incrustation of combustion chamber and piston head can be due to the deposit of carbon, in consequence of the incomplete combustion of hydro-carbons introduced; and as the only hydro-carbons that enter are contained in the "mixture" and lubricating oil, it follows that, in spite of the care that "Bergamo" claims to exercise in this respect, an excess of one or the other must at times occur in his engine, seeing that he is troubled in this manner. Perhaps he is using a compound oil instead of one with a solely mineral base; there are several brands of oil which are mixtures, and which will not stand the great heat of a high speed internal combustion motor. Or perchance his system of lubrication is faulty, or the pistons let by too much of the oil, this latter especially if there is pressure in his crank-chamber. Changing from one oil to another is bad practice, and when necessary all the old oil should be thoroughly rinsed out from the engine, oil pipes and tank. Let "Bergamo" assure himself that he has a really first grade lubricant, guaranteed by a firm of repute as being pure mineral only, and also let him see that his crank-chamber has a free vent and his piston rings a good fit, and that he exercises sufficient care at no time to have an excess of lubrication or too rich a mixture; he will not, we think, be further troubled with incrustation.]

AN ACCUMULATOR CHARGING QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having been a reader of your valuable journal for a long period, and seeing you supply information on accumulator charging, I should be glad if you could assist me in the following matter. In addition to our works and garage, we have just acquired a show room in which the town's electricity is available. We do not intend to use it for lighting purposes, but what I want is to get the current adaptable for charging accumulators without using lamps or wire for resistance if this is possible. I should be glad if you could tell me if that can be arranged, and if so, in what way?—Yours truly,

H. PYLE.

[If the electricity supply is "continuous" current, our correspondent can instal a motor transformer, which is a machine to reduce the high voltage to a low one, suitable for charging accumulators. For instance, if the supply is 220 volts pressure, and a current of 1 amp. was being taken to charge a battery, through lamps, about one fifth of a unit per hour is being wasted, but the motor transformer reduces the high voltage to say 10 volts, and at 1 amp. the battery will only use one-hundredth part of a unit per hour. The motor transformer gives a much lower voltage, and a much higher current for the same power, for the same money. If, however, the electricity supply is not "continuous" but is an

"alternating" one, there will be more difficulty in obtaining a machine and it will cost more. The machine in this case will be called a motor generator, and consists of a dynamo driven by a motor worked by the supply current. That is to say, a 220 volt motor is driven by the current, which in its turn drives a dynamo which can be arranged to give the necessary pressure and current desired.

INVITING DISASTER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Mr. A. W. White's letter in the *M.C.J.* of the 9th ult., re careless bus drivers, I, too, saw a gross piece of carelessness, fraught with considerable danger, a few days ago. A car was drawn up outside a tobacconist's shop near Waterloo Station, S.E. It was quite unattended and there was a perceptible smell of petrol in the air. An examination showed that the driver had fixed a two-gallon tin of petrol in such a way that it should have emptied itself into the tank of the car. Of course, the moment his back was turned, the can had slipped, and instead of the liquid passing into the tank, it was saturating the wood work of the car and dripping on to the ground. I made it my business to search out the driver and threatened to report him for his carelessness, for, had anyone chanced to throw down a match, the car would have instantly been in a mass of flames.—Yours truly,

W. C. J.

THE LICENCE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should like to know the experience of your readers with regard to the conduct of the police, so far as the licence of the driver is concerned. In the crowded streets of the metropolis I have been stopped in order that a constable might examine my licence, while a

The 28-h.p. Daimler Car recently supplied to Mr. Christopher Wade, of Kirk Ella Hall, Hull, by the Hull City Garage, Ltd.

gaping crowd assembles to enjoy themselves at my annoyance. Can a policeman really demand to see the licence and to take note of the declarations on the back? This, it seems to me, is manifestly unfair, for in the event of the licence being freely endorsed, the policeman might feel better able to get up a case against a victim. In the police court the convictions against a prisoner are not mentioned until he has been found guilty, but evidently a different rule prevails in the case of motorists. For obvious reasons I do not give my name for publication, but enclose my card.—Yours truly,

A. B. C.

[The police officer has no right to do other than look at the licence, and we have recollections of a case where the magistrate reprimanded a constable who thus exceeded his duty.]

LOSS OF POWER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Recently I purchased a double-cylinder 10-h.p. Pick car, three speeds forward and reverse, central chain drive and short chain to countershaft. I cannot get more than sixteen miles per hour on a flat road, and I shall be obliged if any of your readers can tell me if that is about the capabilities of the car. Any suggestion to increase the speed will be greatly appreciated.—Yours truly,

M.R.C.S.

[It is to be assumed that "M.R.C.S.," having only recently become possessed of it, has purchased his car second-hand, otherwise it would be more in the province of the maker to assign a reason for its poor performance. Considering the great number of causes that may conduce to the bad running of a car, it is only possible to hazard a guess in view of the lack of data furnished by our correspondent. If, for instance, the

car climbs hills fairly well and the engine races on the level, it would show that the gearing on top speed is too low. If it jibs at hills, then either the engine is not giving anything like the power that it should, or something in the running gear may be binding. If it is one of the old Pick cars with horizontal valves, the trouble is in all probability to be sought for there.]

SECRET COMMISSIONS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR.—Having heard there is a Corrupt Practices Act or "Secret Commission Bill" about to come into force, I would ask whether this Act will make a chauffeur liable to fine or imprisonment for accepting a secret commission, or would the giver of the commission or tip be the man liable to fine or imprisonment? When does this Act come into force? It is time there was a little more honesty and fair dealing connected with the running of motor-cars.—Yours truly,

COUNTRYMAN.

[The Prevention of Corruption Act is already in operation, and the first case under the same came before the courts last week. Both the giver and receiver of an illicit commission is liable to proceedings being taken against him.]

SERPOLINE OILS.—A correspondent asks for particulars of the Serpoline oils.

A MOTOR tyre on a Stepney wheel has been picked up near Newbury, and can be obtained on sending particulars as to size, &c., to Messrs. Stradling and Plenty.

THE ACME RUBBER AND TYRE COMPANY, 343, St. Vincent Street, Glasgow, inform us that by their process they can satisfactorily repair burst tyres and guarantee the same for at least 1,000 miles.

PAINT FOR RENOVATING CAPE CART HOODS.—Replying to "J. B. M.'s" inquiry in the last issue of the *M.C.J.*, a correspondent writes that Messrs. J. and A. Woolley, of Rutland Street, Nottingham, make a paint or dye suitable for the purpose required.

A FLEXIBILITY TRIAL.—Mr. D. M. Weigel writes stating that he is willing to accept Mr. S. F. Edge's challenge for a comparative trial of a six-cylinder vehicle against a four, and will pit his 40-h.p. Weigel against a 40-h.p. Napier. The conditions he proposes are:—(1) Slowest speed on top gear over one mile, 100 points; (2) fastest speed on top gear over one mile, 100 points; (3) Fastest up a hill to be chosen, 100 points; (4) Non-stop run to Brighton and back, every change of speed to be the loss of 100 points.

ADVICE WHICH SHOULD NOT BE FOLLOWED.

ONE of our readers has kindly written to inform us that up to the present he has missed in our columns that series of replies which are given to correspondents whose inquiries are not at the same time inserted. There is certainly, as he points out, a weird interest about such columns, somewhat like hearing a person at one end of a telephone when one is wondering what the other end is saying. For the benefit of the "Indian Motor News" our correspondent kindly forwarded a list of answers to several burning subjects—not necessarily for publication—but they are so good that we have decided to reprint them.

J. W. B.—No, we do not advocate lemonade as a substitute for acid.

A. H.—Use graphite for the hands and face when retiring to rest at night.

GARAGE.—Your mistake. The pit is not intended to store the car in.

MECHANIC.—Text Books say that you should go over every nut before taking your car out. The operation can be done in twelve hours.

PUZZLED.—The symptoms tend to show that you have applied treacle as a lubricant. It is not so suitable as coal tar.

FLYER.—Etiquette of the road suggests that you should inquire if you can assist. But this is only a form of courtesy, as you will be out of hearing when the answer is given. Therefore always do it.

B. M. C. C.—Price depends on the audacity of the seller. With such a variety of infirmities we can only give you one advice, sell it to a friend. Follow the U.S. system of swabbing all the machinery with aluminium paint, and if this does not suffice, gild the Cape cart hood.

DOLLY.—No, the colour of the body would not match her complexion.

GEORGE.—The 18 in. side entrance door is made to carry a coat of arms or monogram of that dimension. Not on the back panels as well; you might be mistaken for a circus.

ENQUIRER.—You can readily ascertain if the current is on by feeling the sparking plug.

MESSRS. CARR BROTHERS AND ASH, of Johannesburg, have just taken delivery of an Austin car.

THE Earl of Rothes has just taken delivery of his new car, a 20-25-h.p. Mercedes, supplied by the sole importers, Ducros Mercedes, Ltd.

MESSRS. SIMPSON AND COMPANY, of 38, Dover Street, W., have been appointed London agents for the cars and tri-cars of the Riley Cycle Company, Ltd., Coventry.

THE Continental Tyre Company states that at the Motor Exhibition at the Agricultural Hall, London, its pneumatic tyres were fitted to 35 per cent. of the cars.

CLUBS AND ASSOCIATIONS

ROYAL A.C.

THE following are the stewards of the Club, as elected at the meeting of the General Council held last week:—The Duke of Sutherland, K.G., Earl Russell, Lord Stanley, C.B., Sir David L. Salomons, Bart., Sir J. H. A. Macdonald, K.C.B. (Scottish A.C.), Sir W. G. D. Goff, Bart. (Irish A.C.), the Hon. Arthur Stanley, M.P., Col. H. C. L. Holden, R.A., F.R.S., Mr. C. D. Rose, M.P., Mr. E. H. Cozens-Hardy, Mr. Charles Hardy (Nottinghamshire A.C.) and Mr. Philip S. Foster (Midland A.C.)

CAMBS. AND ISLE OF ELY A.C.

THE Committee of this club in presenting the first annual report is glad to be able to record satisfactory progress. It has only been formed eight months, but already embraces a membership of 54, the members coming from all parts of Cambridgeshire and Isle of Ely.

It is a subject of warm congratulation to the committee of the club that Mr. C. D. Rose, M.P., one of the members, should have been elected to the chair of the Royal Automobile Club, and also of the Motor Union of Great Britain and Ireland.

Among the various questions which have engaged the earnest attention of the Committee the following may be briefly mentioned:—(1) The application for a speed limit for Newmarket, and for the purpose of obtaining information on this question the committee appointed a sub-committee, who went very fully into the matter, taking a census of all the traffic, and obtaining a plan of the road showing the dangerous points, and who recommended that, considering the extraordinary nature of the traffic using the roads in Newmarket, the application should not be opposed. (2) Another question looked into were the tolls charged at Hermitage Bridge, Earith, but while they appear high, being at the rate of 3d. per wheel, the committee hardly feel that they have any serious ground of complaint, as the charge is the same for all vehicles. (3) The repair of roads, especially the bridges over the Great Eastern Railway, is a matter which is being looked into, as these sections of road, which are, it appears, not under the authority of the county road officers, are much neglected, large heaps of sharp flints being shot on them, sometimes at the dry periods of the year, and, therefore, never having a chance of getting in. This nuisance is especially noticeable on the Suffolk side of Cambridgeshire, and the question is now being given the direct personal attention of the chairman of the company, Lord Claude Hamilton.

NOTTINGHAM A.C.

MEMBERS of the Nottingham A.C. arranged formally to inaugurate their summer programme on Saturday with a run to Ye Olde Bell Hotel, Barnby Moor, near Retford. Unfortunately the weather broke down for Saturday's event, and only two cars attempted the trip. The president of the club, Mr. Chas. Hardy, had intended to accompany Mr. and Mrs. P. L. Huskinson on a 28-h.p. Daimler limousine, but owing to the inclement conditions, put off the run. However, about half-past two o'clock the rain ceased, and, making a start, they had a good run, without the usual accompaniment of dust. Upon arriving they found Mr. and Mrs. Jesse Boot and their son on a 30-40-h.p. Daimler. They had also started in the hope that the weather would improve. This was not the case, however, for rain fell continuously all the time they were at Barnby. During their stay there the Siddeley long distance trial car, under the observance of the Royal A.C., turned up, expecting to meet Mr. Siddeley, who had arranged to drive to the meet from London. The Nottingham members have been circularised to the effect that another meet at Barnby Moor will take place to-day (Saturday), when it is to be hoped more favourable weather will be in evidence.

INSTITUTION OF AUTOMOBILE ENGINEERS.

THE Council of the Institution of Automobile Engineers have approved of a scheme to establish a Graduates Section, which will hold separate meetings to read and discuss papers. In addition to papers by the graduates themselves, the Council have arranged for a series of lectures to commence in October next, giving technical instruction on carburation, electricity as applied to ignition, gearing and materials of construction, by Mr. Leslie H. Hounsfield, to enable the graduates to get a sound knowledge of the subject. Prizes will be offered for the most deserving papers read by graduates during the session, and at the graduate meetings the chair will be taken by a member of the Council of the Institution.

The annual subscription for graduates is half a guinea. Gentlemen joining at the present time may do so on payment of the annual subscription, which covers membership of the Institution as a graduate until the end of 1908.

Graduates are to be persons between the ages of seventeen and twenty-six who are being trained as pupils to an automobile engineer.

or are studying engineering as applied to mechanical locomotion, or who otherwise satisfy the Council that there are special circumstances which, in the opinion of the Council, entitle them to admission.

THE AUTOMOBILE ASSOCIATION.

AN Executive Committee meeting was held on Tuesday, at which were present: Colonel Bosworth, Sir Archibald Macdonald, Mr. L. Schlentheim, Earl Russell, Mr. Walter Gibbons, Mr. Charles Jarrott, Mr. S. F. Edge, Mr. D'Arcy Baker, Captain Benett-Stanford and Mr. Charles Temperley.

Members to the number of 190 were elected, prominent among them being—the Earl of Dudley, Earl Cairns, Baron Wassenaer, Sir Henry Norman, M.P., Sir C. B. Lowther, Sir Ernest Cable, Lady G. St. Laurence, the Hon. Mrs. Hylton Philipson, Sir John Bell, Sir C. H. Elliott, Sir Ralph Gore, Major Burt, Captain Percy Balfour, Captain Waring, Major Collis Browne and Captain Guy Gaunt, R.N. It was pointed out that a large number of these was due to the Cordingley exhibition, at which space for a stand was kindly granted by the proprietor. A vote of thanks to Mr. Cordingley for his kindness was carried unanimously.

The secretary reported that the road manager had, on the previous

THE CRYSTAL PALACE A.C.

THE Crystal Palace A.C. has been granted a permit to hold a race meeting on the Bexhill track on Whit-Monday and Tuesday. The programme of events will include a handicap open to touring cars; a race limited to cars with engines and chassis of the dimensions similar to the Kaiserpreis; 100 yards, slow speed (on top gear); standing half-mile, any speed (on top gear); flying quarter-mile, any speed; competitors may take any of their speeds and term that the top speed, providing every speed above it is properly locked; scratch race for four-seated touring cars, chassis price up to £700; scratch race for four-seated touring cars, chassis price over £700; handicap for motor-cycles; scratch race for motor-cycles.

KENT A.C.

THE first meet of the season took place at the Royal Crown Hotel, Sevenoaks, on Saturday. About forty members and friends were present. Amongst these were Mr. C. J. Morgan, the chairman, and Mrs. Morgan, Dr. and Mrs. Firth, Mr. Owen Firth, Mr. and Mrs. Nash, Mr. and Mrs. Wyllie, Mr. A. Gurney Preston and Miss Preston, Mr. W. Willis, Col. Latter, Mr. and Mrs. R. Waddington, Mr. and

Part of the Fleet of Motor Vehicles belonging to the Austrian War Authorities lined up for the inspection of a Commission from Bulgaria. *(Allgemeine Automobil Zeitung.)*

Saturday, started on an inspection tour of the A.A.'s patrols, district managers, and local agents, which will extend over 2,000 miles.

The chairman referred to the fact that succeeding meetings will be held in the Association's new offices, Princes Buildings, Coventry Street, W., which are being prepared for immediate occupation.

THE COMMERCIAL MOTOR USERS' ASSOCIATION.

A MEETING of the executive committee was held at 1, Albemarle Street, Piccadilly, W., on the 10th inst. The officers of the Association were re-appointed as follows:—Chairman, Col. R. E. Crompton, C.B.; hon. treasurer, Mr. E. Shrapnell Smith; solicitor, Mr. T. W. Staplee Firth; secretary, Mr. Rees Jeffreys. The following were added to the committee:—Capt. Wilfred Dumbell (London General Omnibus Company, Ltd.), Messrs. W. M. Hodges (the City and Suburban Motor Cab Company, Ltd.), Iltid Witherington and E. G. Brewer.

The question as to the methods of increasing the membership and proposals re extending the Association's activities were considered. It was resolved to prepare a list of users of commercial vehicles, and members and others in a position to furnish names for the list are requested to send particulars to the secretary.

Mrs. Jones, Miss Pain, Mr. Cobham, Mr. and Mrs. F. Bailly, Mr. and Mrs. Batchelor, Mr. and Mrs. Neate, and the hon. secretary and Mrs. Kenyon.

LADIES' A.C.

THE Ladies' Automobile Club was invited by Mr. and Mrs. Charles Cordingley to visit the Automobile Exhibition at the Agricultural Hall, London, on the 10th inst. Quite a number of the club members and their friends were able to inspect the new models on view and the novel exhibition of model flying machines. After the various stands had been visited, the members were made welcome by Mrs. Cordingley in a cosy, quiet room, where tea was served. The Ladies' Pompadour Band, dressed in quaint, old-fashioned costumes, discoursed lively music.

Amongst those who accepted Mr. and Mrs. Cordingley's invitation were: Mrs. Auerbach, Miss Blaker, Miss B. C. Burns, Mrs. Buttener, Miss Jessie Cadman, Baroness Campbell von Laurentz, Lady Edward Spencer Churchill, Mrs. St. John Coventry, Miss Davies-Cooke, Mr. Ernest Esdaile, Mrs. Louis Fagan, the Hon. Mrs. Chas. Forester, Mrs. Foster, Mrs. Gordon, Mrs. Lesmoir Gordon, Mrs. C. Greenall, Mrs. Griffin, Mrs. Gunston, Mrs. Paul Hardy, Mrs. Russell Harper, Mrs. and

Miss d'Esterre-Hughes, Mrs. McBride Legh, Mrs. Sydney Leo, Mrs. Manville, Mrs. J. Biddulph Martin, Mrs. Moore-Brabazon, Mrs. P. Morel, the Marchioness of Ormonde, Miss Orpen, Mrs. Piggott, Miss Pilcher, Mrs. G. Pitman, Mrs. and the Misses Riley, Mrs. Chas. E. Shaw, Lady Katherine Somerset, Mrs. Benett Stanford, Miss V. Stubbs, Mrs. Wm. Whitaker and Miss Zula Woodhall.

HERTFORDSHIRE.

THE venue for the Hertfordshire County A.C. hill-climb was changed from Aldbury to Aston Hill on Saturday. The weather was fine, and the event passed off without accident of any kind, but the surface was in a rather loose condition, and care had to be exercised at the bends. The fastest time of the day was made by O. C. Godfrey on a twin-cylinder Rex, his time being 56½ sec. The machines were divided into five classes. The results on formula will be announced later.

THE ROADS IMPROVEMENT ASSOCIATION.

THE annual general meeting of the Roads Improvement Association (Incorporated) will be held at 1, Albemarle Street, Piccadilly, London, W., on Thursday, April 25th, at 5 p.m. As soon as the business of the general meeting has been disposed of an extraordinary general meeting will be held for the purpose of considering and, if thought fit, passing an alteration in the articles of association. A further extraordinary general meeting will be held to confirm this alteration on May 14th.

THE Kent A.C. will hold a touring car competition on the 25th prox.

THE annual meeting of the Automobile Club of North Wales will be held at the Waterloo Hotel, Bettws-y-Coed, on the 6th prox.

THE Northern Motor-Cycle Club is being formed, with Mr. J. B. Foster, Nevill's Cross, Durham, as hon. secretary *pro tem*.

MR. FRANK DEACON, 4, Fatherson Road, Reading, the hon. secretary of the Reading Motor-Cycle Club, is anxious to arrange inter-club runs with other southern organisations.

LORD HARLECH has been elected president of the Shropshire A.C.

THE Newcastle Motor Club will attend a Whitsuntide meet of clubs at Barnard Castle.

THIS year the British Motor Boat Club's opening Thames meet will take the form of a cruise and garden party. It will be held at Eel Pie Island, Twickenham, early in June.

AFTER the last meeting of the East Lancashire Motor Cycle Club, Mr. A. C. Beard, of Blackburn, gave an interesting talk on tyre repairing, exhibiting an instrument for repairing a tyre by vulcanisation.

BEFORE the Yorkshire A.C. Mr. F. Thoresby has been lecturing on the Evolution of the Motor-car.

THE fourth annual Reliability Trials for motor vessels, organised by the Motor Yacht Club, will take place at Southampton on July 30th and 31st.

WE regret to hear of the death of Mr. G. W. Blackaller, who was prominently associated with the Cardiff Motor Club.

SCOTTISH RELIABILITY TRIAL, 1907.

THE following firms have now entered cars:—John A. Peacock (Chenard and Walcker), Walter Gutman (Chenard and Walcker), Reo Motors, Ltd. (Reo), Albion Motor Car Company, Ltd. (Albion), New Arrol-Johnston Car Company, Ltd. (New Arrol-Johnston), John S. Napier (New Arrol-Johnston), T. C. Pullinger (Beeston Humber), Rolls Royce, Ltd. (Rolls Royce), Rennie and Prosser, Ltd. (Siddeley), W. Watson (Berliet), St. Vincent Motor and Cycle Company, Ltd. (St. Vincent), Frederic Eastmead (Sunbeam), Argyll Motors Ltd. (Argyll), Capt. F. Vernon Westworth (Daimler), Belsize Motors, Ltd. (Belsize), Mrs. Ed. A. Riley (Belsize), Thomas Shaw (Dundee), Ltd. (Siddeley), Western Motor Company, Ltd. (Argyll), Walter Phillips (Coventry Humber), Buchanan Shiell (Mercedes), Adams Manufacturing Company, Ltd. (Adams Hewitt), Thos. Shaw (Ariel), Frederic Coleman (White steam car), Horsfall and Bickham (Horbick), Buchanan Shiell (De Dion), J. E. Hutton, Ltd. (Berliet), De Dion-Bouton, Ltd. (De Dion), J. W. Stocks (De Dion). The entries, which now number 37, close on the 14th prox.

IN reply to correspondence re cost of tyres several correspondents have written recommending tyres of various makes; what the original inquirers apparently wished to know, however, was the cost of running, &c.

OWING to the development which has taken place during the last year in the motor department of the Vauxhall and West Hydraulic Engineering Company, Ltd., it has been found necessary to create a new company to cope with the increasing demand for Vauxhall cars. The new concern, Vauxhall Motors, Ltd., have taken over a large portion of the premises belonging to the old company, which stand upon ten acres of land at Luton, Beds. Every process connected with the manufacture of motor-cars is carried on there, from the making of a small bolt to the upholsterer's last tap of the hammer. Vauxhall Motors, Ltd., have appointed Mr. Tom Williams assistant manager and secretary. This gentleman was for some years with Messrs. Friswell, 1906, Ltd., as secretary, having resigned his position with that firm to take up the new post.

CASES UNDER THE MOTOR CAR ACT.

—♦— DANGEROUS DRIVING.

Lord Vernon, of Poynton Towers, Cheshire, has been summoned before Mr. J. M. Yates, K.C., at the Manchester County Police Court on three charges of driving a motor-car to the danger of the public at Levenshulme in March. Mr. John Crofton prosecuted for the police, and Lord Vernon was represented by Mr. J. G. Barclay.

Mr. Crofton said that on the afternoon of March 24, the defendant was driving a motor along Stockport Road, Levenshulme, in the direction of Manchester, at a speed estimated at from thirty to thirty-five miles an hour, and on the same day he returned along the road at a similar speed. On the following day he was driving along Wellington Road, Heaton Chapel, at a speed also estimated at from thirty to thirty-five miles an hour. At the times named the traffic on the road was fairly heavy, and important thoroughfares led on to Stockport Road, so that the speed was dangerous to the public. Mr. Barclay urged that Lord Vernon was not conscious that he was committing an offence. Mr. Yates said that a fine of 20s. and costs in each case, with a guinea extra costs, would be imposed. This altogether was £8 18s.

Two cases of alleged reckless driving came before the Uckfield justices one day last week, and, by a curious coincidence, the death of a dog figured in each. In the first Joseph Alfred Fisher, Steinhilme, Warlingham, was summoned for recklessly driving a car at Danehill on January 12th, and evidence was given to the effect that on that date a dog belonging to Elias Baker was run over by defendant's car and killed.

The owner of the animal and another witness, named Thomas Turner, who were on the road at the time, estimated the speed of the vehicle at from twenty-five to thirty miles an hour, and further alleged that the defendant did not stop. Afterwards, however, the defendant, whose absence abroad accounted for the delay in the proceedings, called on Baker and offered to recompense him for the loss of the dog. The defendant strongly denied the allegation of reckless driving and asserted that his attention was fixed on some children playing lower down the road rather than on the dog, and that the reason he did not pull up was because he neither knew that an accident had happened nor that anyone called out to him. In the end the Bench decided that the summons had not been proved, and dismissed the case.

In the second case a fox-terrier, belonging to a carman, fell a victim to a car driven by Henry Joseph Watts, chauffeur, of The Mount, Ifield, on the East Hoathly-road on March 20th. Giving evidence in support of the summons against Watts for driving at a speed dangerous to the public, Rogers and two other witnesses estimated that the vehicle was travelling at thirty miles an hour. They further stated that the defendant drove on after running over the dog. The Chairman said the Bench were of the opinion that the car was driven at a speed dangerous to the public, and the case was certainly made worse by the defendant driving away. He would be fined £5 and £1 5s. 10d. costs.

At Accrington, George Stevenson, of Burnley, has been fined 40s. and costs for driving a motor-car to the danger of the public. It was given in evidence that the defendant had run into a crowd of people, knocking several of them down.

EXCEEDING SPEED LIMIT.

On Saturday, at the Chichester County Bench, before the Duke of Richmond and Gordon and other magistrates, Chas. James Huxtable, Reading, was summoned for driving a motor-car at a speed exceeding twenty miles an hour, at Westhampnett on Good Friday, and fined £5 and costs. William Henry Keys, a driver, 14, Park Street, London, W., was also summoned, the speed alleged being twenty-five miles an hour, on Saturday, 30th March. He was fined £3 and costs. Claud Edward Woakes, 52, Harley Street, London, was similarly summoned for a speed of twenty-six miles an hour, and was fined £3.

AERONAUTICS.

THE race for the Harbord Cup, presented by the Hon. Mrs. Asheton Harbord, under the Aero Club's International Federation Rules, will take place at the Ranelagh Club, Barnes, S.W., weather permitting, on Saturday, May 25th, at 4 p.m. Members desiring to compete are requested to advise the secretary on or before Wednesday, May 22nd. The winner will be the competitor who lands nearest to a point designated, prior to the start, by the Organising Committee of the Aero Club on the ground. Balloons over 40,000 cubic feet must carry at least two persons in addition to the competitor. Balloons under 25,000 cubic feet need only carry the competitor.

LECTURING at the Royal Institution on "Wings and Aeroplanes," Professor G. H. Bryan has likened the butterfly in efficiency to the dirigible balloon. They only appeared in calm weather, and could make no headway against a strong wind. Another aspect of the problem of flight was that of the sailing birds. It would be no use for anyone to rely on obtaining any results of practical importance by means of imitating the gymnastic feats of sailing birds. These did sometimes go a long distance, but they had to go where the wind took them to a certain extent, and when they wished to go in a particular direction without reference to the wind they had to use their wings.

VAPOUR EMISSION COMPETITION, 1907.

THE Committee appointed to conduct this competition on behalf of the Royal A.C. have to report that the competitive experimental enquiry into the quantity, duration, and composition of the smoke and products of combustion discharged from the exhaust pipes of the engines of petrol motor vehicles was carried out on March 19th and 20th in accordance with the regulations issued by the Club, dated January 3rd, 1907, and the gases collected were analysed during the next succeeding days. The object of the enquiry was set forth as follows in the particulars and regulations covering the competition:—

"The competition has been inaugurated by the Club with the object of encouraging the improvement of the design of existing petrol-driven motor-cars, in order to diminish the nuisance caused by foul exhaust. The trouble generally arises from two causes:—First, from an improper mixture, giving an excess of poisonous carbonic oxide in the exhaust gases; secondly, from excessive lubrication, causing an emission of blue smoke, due to the lubricant finding its way into the upper parts of the cylinders."

Twelve cars out of the thirteen entered were presented for trial, as follows:—

- | | | |
|--------------------------------------|-----|-----------------------------|
| 1. Mr. Walter Gutmann | ... | 16-20-h.p. Chenard-Walcker |
| 2. Messrs. S. F. Edge, Ltd. | ... | 40-h.p. Napier |
| 3. Sturmeys Motors, Ltd. | ... | 30-35-h.p. Lotus |
| 4. De Dion Bouton, Ltd. | ... | 24-h.p. De Dion-Bouton |
| 5. The Pilgrims Way Motor Co., Ltd. | ... | 32-h.p. Pilgrim |
| 6. Mr. J. T. Newell | ... | 22-h.p. Clement (withdrawn) |
| 7. Ariel Motors (1906), Ltd. | ... | 35-45-h.p. Ariel |
| 8. The Albion Motor Car Co., Ltd. | ... | 16-h.p. Albion |
| 9. The Albion Motor Car Co., Ltd. | ... | 24-h.p. Albion |
| 10. The Austin Motor Co., Ltd. | ... | 18-24 h.p. Austin |
| 11. Messrs. Straker and Squire, Ltd. | ... | 25-h.p. Straker-Squire |
| 12. The Belsize London Agency, Ltd. | ... | 26 h.p. Belsize |
| 13. The Lanchester Motor Co., Ltd. | ... | 20-h.p. Lanchester |

The exhaust silencers of all these cars (except No. 6, which was not tested) were fitted with screw unions for the attachment thereto of a pipe for drawing off into a receiver a quantity of the discharged products. The receivers were specially made for this purpose of thin copper with the necessary pipes and cocks, each vessel being approximately of 900 cubic inches capacity.

The first part of the competition consisted in placing each car on an incline of one in seven both up and down grade and running the engines light during ten minutes, a portion of the exhaust being all this time passed into the receiver. The contents of these receivers were then transferred to the glass vessels of the analytical chemist for analysis.

The second part of the competition consisted in running the cars under ordinary conditions, but with an observer on each car, to Daventry and back, the receivers being again connected and the exhaust again collected during ten minutes while the cars ran from Barnet Hill bottom to a place about 3½ miles therefrom. During the runs to and from Daventry observations were also made as to the character of the exhaust of the several cars, i.e., if visible and objectionable.

The results of the analysis of the exhaust discharge and of the road and motor-house observations of smoke from the several cars have been carefully examined and considered, and have enabled the judges to place the cars in the following order of merit:—

- | | | | |
|------------|-----|----------------------------|-----------------------|
| 1. No. 5 | ... | 32-h.p. Pilgrim | } equal. First award. |
| No. 13 | ... | 20-h.p. Lanchester | |
| 3. No. 9 | ... | 24-h.p. Albion | Second award. |
| 4. No. 8 | ... | 16-h.p. Albion | |
| 5. No. 12 | ... | 26-h.p. Belsize | |
| 6. No. 1 | ... | 16-20-h.p. Chenard-Walcker | |
| 7. No. 2 | ... | 40-h.p. Napier | |
| 8. No. 10 | ... | 18-24-h.p. Austin | |
| 9. No. 7 | ... | 35-45-h.p. Ariel | |
| 10. No. 4 | ... | 24-h.p. De Dion Bouton | |
| 11. No. 11 | ... | 25-h.p. Straker-Squire | |
| 12. No. 3 | ... | 30-35-h.p. Lotus | |

The order of merit reflects the result of the analyses. From 33 per cent. of the cars the carbonic oxide discharged was, on the average of the trials of the two days, under 2 per cent. of the whole. The quantity discharged from the other cars was over 2 per cent., and in some cases was considered excessive.

As a result of the competition the judges recommend the following awards:—

- | | |
|---|-----------------------|
| Car No. 5, the Pilgrims Way Motor Co., Ltd. | } Equal. Gold Medals. |
| Car No. 13, the Lanchester Motor Co., Ltd. | |
| Car No. 9, the Albion Motor Car Co., Ltd. | |

MR. M. ORMONDE DARBY informs us that he has severed his connection with the firm of Reid, Darby and Company, and that his temporary address is Thames Ditton, Surrey.

FROM the Laystall Motor Engineering Works, Ltd., of 27 and 29, Laystall Street, Rosebery Avenue, London, E.C., comes an illustrated list giving particulars of their facilities for repair work. The company makes a speciality of this—in fact, they confine themselves to repairs. The works are adequately equipped for anything in this line, and country motorists are assured of prompt attention to instructions.

THE USE OF THE "DAIMLER" NAME.

THE Master of the Rolls, Sir Gorell Barnes, and Lord Justice Kennedy, in the case of the "Daimler Motor Company (1904) Limited v. the London Daimler Company, Limited," have heard an appeal by the plaintiff company against the refusal of Mr. Justice Buckley to grant an injunction to restrain the London Daimler Company, Limited, from using or carrying on business in a manner or way, name or style, which included the word "Daimler," or which so nearly resembled it as to be calculated to induce the public to believe that the business was the same as that carried on by the plaintiffs, or in connection with motors, chassis, motor-cars, or carriages, manufactured, sold, or offered for sale by the defendants.

The Master of the Rolls, in giving judgment, said that the learned judge had held that the name "Daimler" could be honestly used by the defendant company without suggesting that they were connected in business with the plaintiff company. On behalf of the plaintiff company, it was argued that this could not be, and, further, that the word "Daimler" had acquired a secondary meaning in this country, and now denoted cars manufactured only by the plaintiff company.

While he agreed with the decision of the learned judge as to the right of the defendants to use the word "Daimler" in the name under which they traded, he thought that the plaintiffs were entitled to succeed in this appeal as to the second part of the injunction, namely, the use of the word "Daimler" in connection with motors, chassis, motor-cars, or carriages manufactured or sold by the defendants. With this limitation the appeal would therefore be granted.

The other members of the court concurred, and the appeal was accordingly allowed.

Mr. John Hall, the old Civil Engineer who walked to the Cordingley Show from Eye, in Suffolk, with his model Aeroplane. Mr. Hall has been studying the question of aerial navigation for thirty years.

COMPANY NEWS.

NEW COMPANIES REGISTERED.

GOLDSCHMIDT MOTOR ACCESSORIES.—£1,500. To adopt an agreement with Mr. G. Goldschmidt. First directors: Messrs. G. Goldschmidt and G. Grundy. £5. 61, Cleveland Street, W.

MORSE TAPE BALL BEARING COMPANY.—£2,000. To acquire and turn to account provisionally protected inventions for improvements in ball-bearing joints for levers and for improvements in similar joints for machinery of all kinds where usually a straight pin has been used, and to adopt an agreement with Mr. S. G. Mason, 6, Cherry Street, Birmingham.

F. H. SMITH MOTOR ACCESSORIES.—£25,000. To acquire from Messrs. F. H. Smith and H. Coates the benefit of certain inventions relating to carburettors for petrol motors. Mr. F. H. Smith is managing director. 5, Old Queen Street, S.W.

HIDE TYRE AND MOTOR SYNDICATE.—£2,000. To acquire and turn to account the patents known as the "Unpunck" tyre. Registered without articles.

VICI MOTORS (1907), LIMITED.—Capital, £60,000. To carry on the business of mechanical, electrical and general engineers, manufacturers of steam, electrical, oil, spirit and other motor-vehicles, and their parts and accessories. 64, Salisbury Road, West Kilburn, N.W.

BRITISH ELECTROMOBILE COMPANY.—£25,000. To acquire the business of electrical engineers and motor carriage makers carried on by the Carl Oppermann Electric Carriage Company, Limited, to acquire from Mr. C. T. J. Oppermann, and other certain inventions relating to electric appliances, &c. First directors: Messrs. R. Mickel, A. Kennedy,

D. Watson, C. T. J. Oppermann, and C. F. G. R. Schwerdt, 1, Queen Victoria Street, E.C.

A. B. C. CAR.—£100 (£1). Manufacturers of and dealers in motor and other cabs, &c. The first directors are: B. M. Goode and F. Goode, £5.

ROAD REPORTS.

WEYMOUTH.—The roads in the vicinity of Weymouth are in a very bad condition for motor traffic, and the Roads Improvement Association have made a formal complaint to the Weymouth Rural District Council on the matter.

DORSET.—A motorist in the locality informs us that the road between Wareham (Dorset) and Corfe Castle, Isle of Purbeck, is in a very loose condition—not because of motor-car traffic but apparently due to the heavy traction engines that use that road so freely.

WITTINGTON.—With a view of minimising the dust nuisance for motor-cars passing through Wittington, near Manchester, the Special District Committee of the Corporation has passed a resolution recommending that an application be made to the Local Government Board to draw up a regulation limiting the speed of the cars in the district.

NORTHUMBERLAND.—The County Surveyor of Northumberland says the reason why so many surveyors have failed in the use of tar-macadam is because they do not fully understand its manufacture. The quality of tar and the proportion of pitch are important factors in its success. The time the material is stacked and when laid upon the road are also of importance. It is almost impossible to succeed unless the material is laid upon a strong foundation composed of material equally as hard as the surface material.

YORKSHIRE.—The Eserick Rural District Council is laying down about three miles of road between Fulford and Eserick (high road from York to London) with tar macadam. It is expedient that as little traffic as possible should go over this road, and the Clerk to the Council asks motorists to avoid this road as far as possible. This they can do by changing their route, say from Selby, and approaching York through Naburn, or by coming to York on the west side of the river.

PUBLIC MOTOR SERVICES.

THE Great Western Railway motor-omnibus running from Slough Station to Beaconsfield and Windsor recently carried 1,500 passengers on one day.

A MOTOR char-a-banc service is to be established between Weston-super-Mare and Bristol by the Tramways and Carriage Company of the latter city.

MOTOR-BUSES are now running in public service between Whitchurch and Cardiff.

A STRIKE has occurred among the drivers of the cabs belonging to the United Motor Cab Company.

A MOTOR char-a-banc—one of the Albion Motor Car Company's latest types—is now plying between Ballachulish and Fort William in connection with the Mac Brayne service of steamers. The combination of land and water trips will be appreciated by visitors to the Highlands this season.

THE North Eastern Railway Company have been making experimental tests with a motor-bus in the Blyth district.

THE difficulties associated with the motor-bus section of the business has, according to the report of the company, operated adversely on the profits of Messrs. Thomas Tilling, Ltd., for the past year.

THE Town Clerk of Brighton has been asked to report to the Watch Committee with regard to a suggestion for the revision of bye-laws at an early date, with a view to giving the authorities greater power over the running of the motor-buses in the town, more particularly in the direction of regulating the time tables.

THE Merthyr Tydfil Borough Council is being asked to establish a service of public motor vehicles in the district.

THE motor passenger traffic between Folkestone and Hythe is assuming considerable proportions.

MOTOR-CAR ACCIDENTS.

A WORKMAN named Duddridge has been crushed to death on the premises of the British Motor-Body and Wheel Works, Limited, King's Cross. A motor-bus, intended for exhibition at the Agricultural Hall, was being lowered from the upper floor of the building to the chassis awaiting its reception on the ground floor when the pulley chain gave way. The omnibus crashed to the ground and was wrecked, and Duddridge was so terribly crushed that he died almost immediately.

WHILST a motor-car belonging to the Marquis of Salisbury, and in which Lady Selborne, Lord Howick, and Lord Wolmer were riding, was near Quaker's Lane, Potter's Bar, en route for Hatfield House, about midnight on Sunday, it knocked down a hackney carriage driver named Harding, living at Frampton Road, Little Heath. Dr. Jackson, police surgeon, was quickly called by the police to see the unfortunate man, whom he found dead.

AT Westminster, on Monday, Mr. John Troutbeck inquired into the cause of death of William Kirk, 52, employed by the Westminster City Council, and lately living at Pimlico, who, while working in Ebury Street the previous Thursday, was knocked down and killed by a motor-car

belonging to Mrs. Gilliot, of Upper Belgrave Street. The chauffeur has since been arrested and charged with manslaughter at the Westminster Police Court, and has been remanded for a week. Giving evidence on his own behalf, the driver said he tried to pass the deceased man on the right hand side, but the man moved back into the way of the car, which knocked him down, and the front wheels went over him. The jury returned a verdict of "Accidental death," and added that they considered there was a certain amount of negligence on the part of the chauffeur, but not sufficient to make it criminal.

POLICE TRAPS.

THE Southwick police trap is reported to be in thorough working order.

POLICE traps may soon be expected in and about Deal, the high rate of speed indulged in by some drivers passing through the town having caused local public men to direct police vigilance towards motorists.

THERE is a measured quarter of a mile on the Chichester and Arundel road at Westhampnett. Two policemen armed with stop-watches are in charge.

NEWS comes of the renewal of police-trapping enthusiasm in Buckden and Alconbury—two villages on the Great North Road, of which many motorists have unpleasantly expensive memories.

BUSINESS NEWS.

MESSRS. S. F. EDGE, LTD., have sent us a photograph of a small and convenient feature of the 18-h.p. Regent car, viz., a slide rail adjustment to the support of the radiator fan spindle, allowing of the instant adjustment of the belt by merely slackening one nut. This is a matter of convenience in actual use, as it very often happens that in cutting a belt too much is taken off, with the result that it has to be forced on, throwing excessive strain on the bearings.

THE ACETYLENE ILLUMINATING COMPANY, LTD., 268, South Lambeth Road, London, S.W., have taken on lease the adjoining premises, No. 270, South Lambeth Road, with the factory buildings in the rear. This large addition to their working space has been rendered necessary by the rapid growth of the business in motor-car lighting by dissolved acetylene, and in the repair of broken parts, such as gear cases, &c., by their welding process, and will enable them to give more prompt delivery than has sometimes been the case hitherto.

THE GRACILE MOTOR CAR COMPANY, LTD., 66 and 66A, Great Russell Street, London, W.C., inform us that by an agreement between the J.P. Motor Company, Ltd. and themselves, the two companies have amalgamated and will in future trade as the Gracile Motor Car Company, Ltd. They will continue to hold the sole agency for J.P. cars, as also for Gracile cars, and will use their premises at Great Russell Street for the purpose of showrooms, and those at 24, Mortimer Market, W., as a repair shop and garage. Messrs. E. Brun and A. D. Barton, of the J.P. Motor Company, Ltd., have joined the board of the company, and will take over the complete management of the wholesale, garage and repair business of the joint companies.

THE ORACLE MOTOR COMPANY, of 187, Gray's Inn Road, W.C., are taking over the castings and motor specialities of the London Autocar Company.

MESSRS. HUMBER, LTD., have just issued a new catalogue, which should be in the hands of all users and prospective owners of Humber cars, the production being one in every way worthy of these popular vehicles. A tribute to the excellent organisation and great output of the Humber factories is seen in the fact that they are well capable of coping with the demand for these cars, it being stated that prompt delivery can be given of any model to any part of the country. Full particulars are given of the different Beeston and Coventry Humber models, these being accompanied by drawings which should enable the novice to follow how every part of the machines works. The booklet concludes with a list of Humber successes in 1906, and a number of testimonials from satisfied users.

AMONG the recent purchasers of the "Windham" sliding detachable motor bodies are Sir Henry Norman, M.P., Vice-Chairman of the Royal Automobile Club, Major Ponsonby, C.B., C.V.O., Equerry to His Majesty the King, and Mr. Gerald W. Balfour.

FROM the Rennie Manufacturing Company, Brighton, comes a copy of their new catalogue, in which particulars are given of the four models of Rennie cars now being turned out—10-12-h.p., 12-15-h.p., 25-30-h.p., and 30-h.p. The first three are fitted with four-cylinder motors, while the large vehicle has a six-cylinder engine. The company had intended to show several of the cars at Cordingley's Exhibition, but were unable to do so at the last moment owing to a fire at their factory.

AS a result of a Daimler car climbing Cudham Churchill Hill, near Brasted, Mr. N. A. Sanderson has placed an order with the Daimler Company for a 30-h.p. vehicle.

ON the 9th inst. the Siddeley car now undergoing trial by the Royal A.C. equalled the record held by the Dennis car (4,007 miles) for these long distance trials. The total distance run to the night of the 10th inst. was 7,135 miles.

FROM the E. R. Thomas Motor Company, of Buffalo, New York, U.S.A., comes a very elaborate catalogue of the Thomas 60-h.p. and 40-h.p. cars, the details of which are described at length as well as illustrated by numerous photographs.

THE Motor-Car Journal.

VOL. IX.]

LONDON, SATURDAY, APRIL 27, 1907.

[No. 425.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

ON Tuesday evening the Motor Club was inaugurated in its fine premises in Coventry Street, Leicester Square, London, W.C., with a dinner and concert typical of the social element which is to be the main feature of this latest entrant into the club life of the metropolis. Colonel W. J. Bosworth, who has rendered automobilism service as chairman of the Automobile Association, presided, being supported by Sir Archibald J. Macdonald, Mr. Harvey Du Cros, M.P., Mr. Sidney Straker, and a gathering which included the best known gentlemen in the motor trade. The Colonel, in the course of a pleasant speech of welcome, declared that the objects of the Motor Club were to provide a central, comfortable, and convenient place of meeting for all motorists. It was the intention of the committee to leave the politics of motoring and questions of automobile policy to existing institutions which had previously guarded our rights and privileges. Subsequently a tour of the extensive establishment was made by the guests, who were pleasantly surprised at the sumptuous character of the place. Numerous rooms for the entertainment of guests are luxuriously fitted, while the apartments generally could not have been better suited to their purposes had the place been specially designed. Prince's Building, in which the club is housed, has a fine appearance from the street, the internal arrangements being quite in keeping with the exterior. The affairs of the club will be administered by a committee, the members of which have already the confidence of the automobile world. The new institution should rapidly become a rendezvous for motorists generally. We wish long life and much prosperity to the Motor Club, which has certainly made an excellent start.

A New Competition.

It is intended to hold a competition (a hill climb) of a somewhat novel character, for which members of the Royal A.C. only will be eligible. The entrants will be kept in a state of pleasing uncertainty as to the locality of the hill on which they will be requested to display the hill-climbing capabilities of their cars. The hill chosen is exceptionally steep, and no one will be permitted to have a trial run. The maximum gradient will, however, be advertised and the entry fee will be limited to one guinea. On the day fixed the competitors will be invited to meet at a certain spot, and the cars will then travel in procession to their destination.

Unauthorised Restrictions.

Two or three instances have lately come under our notice where the police or local authorities have taken upon themselves the privilege of imposing restrictions upon motorists which are not only contrary to the intention of the Motor Car Act, but are also in some cases opposed to the expressed view of higher powers. In the course of an inquiry into an application by the County Council of Perthshire for regulations prohibiting and restricting motor-car traffic on certain roads, it has transpired that a road surveyor has been

setting up notices indicating the restriction of speed to ten miles an hour in places where he had no permission to do so. Two years ago a similar inquiry took place, when the Secretary for Scotland declined to prohibit traffic on the road where the local authorities now desire to limit the speed of vehicles. Apparently this has not deterred this road surveyor in the Eastern District of Perthshire from setting up these notice boards, and it will be interesting to know how far the practice has extended in Scotland. During the last Reliability Trial in Scotland scores of road signs were observed in certain localities, so freely placed as to occasion surprise and questioning as to whether they were really authorised. The matter is one into which the Scottish Automobile Club might make investigations, and we trust the Secretary for Scotland will show his disapproval of such methods.

Police Presumption.

IN some parts of England the police seem to be inclined to adopt the spirit of the Scottish authorities, carrying it out by methods peculiar to themselves. At Shipston-on-Stour a batch of motorists was brought before the magistrates a few days ago and charged with driving over a measured distance at a speed dangerous to the public. In the course of the evidence it transpired that, as is generally the case, no pedestrians were about, nor was traffic on the road impeded or endangered by the motor-cars. The police sergeant, however, in an unguarded moment mentioned that his merry men stopped all cars that were travelling at more than fifteen miles an hour, this being the limit of speed so far as his view was concerned. If the police are thus to set up their own standard as to the rate at which cars may be driven, there is no need for any supervision of the Local Government Board, and the farce of holding inquiries into the reasonableness of applications might be dispensed with. Such confessions as that of the Shipston sergeant should be noted for use when discussion takes place in the House of Commons.

The Taxes on Motor-Cars.

IN his Budget speech Mr. Asquith made a reference to the motor-car, and while he thought he ought to be disposed to raise the tax on automobiles, he refrained, as we have declared he would, from making such a suggestion. As a matter of fact, he showed the inconsistency of the present method of imposing a duty on automobiles, and brought forward a very good reason for making the maintenance of the highway a national charge, towards which some of the taxes now obtained from motorists should be devoted. We have often pointed out that motorists use the roads away from home as well as those in the counties in which they are registered, so that it may happen that the district which has the most wear and tear from motor-cars passing along its highways receives but a small amount from the registration and licensing fees paid by the owners and drivers of cars. As Mr. Asquith rightly said when introducing the Budget, "nothing could be more illogical or unjust than that distribution of the matter." His own dismissal of the proposal was emphatic. "I have been pressed very much," he said, "to alter and raise the duty on motor-cars. I

ought to be very much disposed to do so. I think a tax on motor-cars is almost an ideal tax, because it is a tax on a luxury which is apt to degenerate into a nuisance. But it is no good, as long as this system prevails, for me or anybody else to put an additional duty on motor-cars. Where does the duty go? It goes to the local authority, by whom these duties are collected, that is, as a rule, the local authority within whose area the person to whom the motor-car belongs resides. Suppose I pay, under a new addition to the motor duty, as I should do in London, an extra duty on my motor-car, the benefit of it goes entirely to the London County Council. It is not, however, the streets and roads of London to which my motor-car does any injury, but the rural districts of England and Scotland."

The Highways Bill.

Bill which will be re-introduced by the Hon. Arthur Stanley. This is supported by motorists on both sides of the House,

RECOGNISING the force that lies in the contention of the Chancellor of the Exchequer with regard to motorists and the roads, the Government should not be slow to give facilities for the passage through the Commons of the Highways

The 15-h.p. Coventry Humber Landauet built for the Hon. H. Gibbs. As will be seen, the body is luxuriously finished, the vehicle being a handsome specimen of modern British automobile production.

including Sir Alfred Hickman, Sir William Bull, Sir Henry Norman, and Mr. Tennant, and seeks to create a central department for the purpose of assisting the local highway authorities, at the same time increasing the highways powers of the county authorities. The measure also provides for the construction of new main roads through and out of the large urban districts, and would generally endeavour to secure an improvement with regard to the construction and maintenance of the great highways of the country.

The Conference on Roads.

ON Friday of last week an important conference of road makers and road users was held at the Building Exhibition in London, when various matters were discussed. Mr. A. Dryland, the County Surveyor of Wiltshire, advocated the use of tar in road construction; Mr. E. J. Lovegrove, the Borough Engineer of Hornsey, expressed himself favourable to the formation of a State Road Department similar to that in operation in France; Mr. H. T. Wakelam, the County Engineer of Middlesex, urged that street widening should be carried out on a systematic plan; Mr. Howard Humphreys set forth some points of the road bridge problem; Messrs. Douglas Mackenzie, and Shrapnell

Smith dealt with skidding on roads; Mr. Rees Jeffreys urged the formation of a central highway authority for the Metropolitan area; and Col. Crompton dealt with a subject of special interest to motorists—viz., the design of modern motor-vehicles in relation to the existing roads.

The Design of Vehicles.

IN the course of his paper Colonel Crompton said it was most desirable that constructors of road vehicles should endeavour to distribute both weight and driving strains over as large a number of wheels as possible, such as was being carried into practice in the Renard train which was shown at the recent exhibition. The Renard train not only distributes the weight over four vehicles instead of one, but it makes these vehicles six-wheeled, and uses the centre pair of wheels of each as driving wheels with compensating devices so arranged that about half the weight on each vehicle is brought on to the central pair of wheels, the front pair and the back pair only carrying the remaining half between them. Another point of importance to designers of road vehicles was the consideration of the steering gear, on which Col. Crompton said:—"So long as the steering gear was of the old traction engine type, where the leading axle is pivoted at its centre, the damage done to the road by the act of steering was practically nil, but since the general introduction of the Ackermann system of steering, the two front wheels being each of them attached by vertical pivots to the two ends of the front axle, it is evident that unless the vertical pivot is directly over the centre of the tread of its wheel considerable strains are brought on the road surface by the act of moving the wheels through an angle, and this is particularly the case with heavy motor wagons. With lighter vehicles also, if the steering wheels are out of adjustment so that the axis of both wheels when the vehicle is being driven straight forward are not truly in line, one or other of the steering wheels must be always slightly slipping sideways, with results disastrous to the rubber tyre, but also hurtful to the road. This side movement at high speed has the effect of stirring up an extra quantity of dust or the loose particles lying on the surface of the road, with the result that they are blown away by the great draught or air current which passes under the body of the vehicle when it is driven at any considerable speed or even at a very low speed when meeting a head wind."

Cars for the Cape.

ELSEWHERE we publish a letter from a correspondent in Cape Colony, who also sends a suggestion which we make public for the benefit of those members of the British trade who intend to cater for the colonial trade. Dr. Roger Chew says it is practically a universal error on the part of makers of automobiles to allow insufficient clearance for the rough and sandy roads of South Africa. This is not confined to English makers, but seems to be an oversight of Continental builders as well. The point is of considerable importance to those who go long journeys, and is one upon which Captain Cuttle will be found a true adviser. Makers should certainly "make a note" and carry the precept into practice.

Cars in Hyde Park.

IN our correspondence columns Sir Wroth Lethbridge, Bart., expresses the view that is generally held by motorists with regard to the prohibition of petrol vehicles from Hyde Park during the season. As he rightly suggests, there may have been reasons for not allowing such automobiles to make use of the Park a few years ago, but recent advances in the design and construction of the petrol car have secured it a place in Society. Should the authorities not see their way to granting the reasonable request that petrol cars should be placed in the same category as other vehicles using the Park, Sir Wroth Lethbridge proposes that the road from the Powder Magazine

to Hyde Park Corner and that from Victoria Gate to Marble Arch might be taken from the present area of restriction. There is no doubt that the prohibition is a deterrent to many fashionable ladies who would otherwise adopt the petrol vehicle, but who cannot understand why such should be refused admission to Hyde Park. Now the matter has been so prominently brought forward we trust that Sir Wroth Lethbridge will continue the agitation, in which he will have the support of all who favour the free development of a movement which must secure its universal way in the long run.

A Speedy Premier.

THE automobile education of the Colonial Premiers is being conducted in the fullest fashion, and they are not exempt from prosecution at the instance of the police. The other day the Hon. F. R. Moor, Premier of Natal, was enjoying a run through Richmond Park. There were no other vehicles about at the time, and no one was in danger from the motor-car. Alas! for the unalloyed delights of

Speed at Slough.

AN instance of what may be regarded as a new departure on the part of the authorities in dealing with the regulation of motor-car traffic comes from Slough. It was reported at last week's meeting of the Automobile Association that attention had been drawn to the practice of driving motor-cars furiously through Slough, which has recently caused considerable annoyance to the residents. The secretary (Mr. Stenson Cooke) had at once investigated the matter, interviewed Superintendent Pearman, and also consulted with one or two prominent members of the Urban District Council, as a result of which two senior patrols were ordered on special point duty at either end of Slough for the purpose of regulating and, when necessary, restraining the speed of motor-cars through the town. The Clerk of the Council was informed of this, and the A.A. Committee's offer to erect warning notices at the expense of the Association has been received by the authorities. To that letter a reply had been received wherein the clerk tendered to the Automobile Association the thanks of the Council for the efforts

M. Naudin on the Sizaire-Naudin Car on which he won the Voiturette Race in Sicily. (See page 181.)

a Colonial statesman! Park-keeper Ballam was on duty and timed the motor-car over a measured quarter of a mile, from the White Lodge to a point on the middle road, discovering that the rate of progress was $20\frac{1}{2}$ miles per hour—rather more than double the regulation speed allowed in Royal parks. The result was the appearance of the driver at the Kingston County Court on Thursday of last week. Captain G. R. Richards, who said that he was present at the request of the Premier of Natal, pointed out to the Bench that no one was inconvenienced, and expressed regret for any offence that might have been committed by the defendant, who was a most careful driver, and had driven the Prime Minister of Natal since his arrival in England. The Chairman said that the Office of Works having issued the summons the Bench had no option but to treat the defendant in the same way as others summoned before them, and they could make no exception in his case. The defendant was then fined £3 and 8s. 6d. costs, but in the special circumstances his licence would not be endorsed. Probably the experience will convince the Hon. F. R. Moor that in some matters, at least, the Old Country might allow its people to go a little faster than is now permitted.

to reduce the speed of motor traffic through the town, adding that "The Council has noticed an improvement, which it is hoped may continue."

Bridge Tolls for Motor-cars.

WE are officially informed by the directors of the Widnes and Runcorn Bridge Company that the tolls for motor-cars have been reduced, and that they are now 8d. for the single journey, and one shilling for the return journey. The directors have thought it desirable to make no distinction between the size of the cars, but to carry all at a uniform rate—a suggestion that should be followed on the minimum basis. The bridge is open on week days from 5 a.m. to 10 p.m., and on Sundays from 9 a.m. to 10 p.m. It affords a great convenience of communication between the two counties of Lancashire and Cheshire, and the company trust that with this reduction of tolls it will be found attractive to motorists generally. How profitable bridge tolls are in some places may be ascertained from the experience at Sandwich during the Easter holidays. Three hundred motorists are reported to have

paid toll on this well-known bridge on the Dover-Margate coast road.

Speed Indicators on Motor-Buses.

WE entirely agree with the remarks of Mr. Lane, the magistrate at the West London Court, with reference to the case of a motor-bus driver which came before him last week. The driver in question was summoned for exceeding the legal limit at Shepherd's Bush, and in reply to the charge said he had no idea he was disobeying the law—neither, probably, did the policeman, but that did not prevent the case coming before the magistrate. Mr. Lane said it was putting a very serious burden on the drivers to expect them to judge what was the speed of their vehicles without the assistance of any indicator or other means, and he thought that the bus companies should consider the question of providing their buses with such instruments. The point is one which the organisers of public motor services should consider, as the expenditure of a few pounds in such a way may ultimately result in their saving fines amounting to considerably more than the cost of indicators.

Police Traps.

POLICE animosity towards motorists has broken out again in the Horsham district, as the police court has lately proved, and traps are in daily operation in the locality. Particularly would we issue a warning to motorists going through Cowfold, where the inhabitants have sent a petition to the authorities asking to be delivered from the motorists who travel hurriedly through the place. In Crawley, too, police activity has become very pronounced, and on both sides of the level crossing that runs across the main London road are quarter of a mile stretches which have been measured, and are now being watched by the police not only on Sundays and at the week end, but practically every day as well. We mention these instances, hoping that our readers in trap-infested areas will keep us informed of police devices and machinations, so that motorists may know where danger lies.

The Commercial Vehicle Trials.

It may now be taken for granted that the Commercial Motor Vehicle Trials, which have been promised and then postponed for three or four years past, are really to take place after all. The committee which will be responsible for their organisation is composed of representatives of the Royal A.C., the Society of Motor Manufacturers and Traders, and the Commercial Motor Users' Association. We understand that the vehicles will be tested over a course which will include the principal industrial centres of England and possibly of Scotland, so that the public will have an education as to the widespread use of commercial delivery vans such as they had in earlier days with regard to the motor-car as a pleasure or touring vehicle. Several makers have notified their intention of entering for the Trials, and as the regulations will be sufficiently comprehensive to include all motor vehicles, a valuable as well as an interesting competition should result.

The Dangers of Petrol.

THE fatal accident at a London motor establishment—to the proprietors of which no blame can in any way be attached—has brought strongly to the front the dangers of the improper use of petrol. A motor fitter was cleaning the floor of the depot, when a fire broke out, causing his death. At the inquest, on Tuesday, Mr. W. H. Allen, Inspector of Explosives for the L.C.C., stated that he was of opinion that the deceased had some petrol, and, knowing the properties of the spirit, he thought he would clean the floor quicker, and mixed the petrol with water. The danger would not only be in the room itself, but in the adjoining premises, and if he struck a

match an explosion would follow. The coroner said it was always found when there was a new industry that all dangers were not recognised at once, but had to be discovered by degrees. They had now heard of a new danger, and there could be no doubt that the trade would welcome any new regulation that would keep their men under control, which was one of the difficulties employers of labour had to meet. It was clearly laid down that petrol must be used only for the purpose of charging tanks, but in this case that had not been observed, and the deceased man, who was in charge, had paid a terrible price for his indiscretion. It was hoped that this case having occurred and exposed the dangers of the use of petrol for cleaning purposes, it might be useful to prevent accidents of this kind in future. He did not know that it was recognised that dreadful results might follow the improper use of petrol. The jury returned a verdict of accidental death, and added a rider to the effect that firms dealing in petrol should prohibit the carrying of matches and cigarettes by their employees.

In the Suez Canal.

THE fact that the directors of the Suez Canal have, on the representation of Sir Marcus Samuel, the chairman of the Shell Transport Company, withdrawn their prohibition of the passage of petrol in bulk along their waterway is a tribute to the growing power of Motorism and also a matter of congratulation to motorists generally. Hitherto, cargoes from the East have had to come via the Cape of Good Hope, involving a lengthening of the journey by twenty days and causing a reduction in the carrying capacity of the steamers engaged in the service. Some of the regulations which the Suez Canal directors are imposing seem somewhat conservative in view of the policy of France in allowing steamers to discharge in the Seine as far as Rouen; but the concession of passage through the canal is to be welcomed. Vessels carrying petrol in bulk are to have a sufficient dead weight on board of non-inflammable materials to enable them to be lightened by their discharge, in case of necessity, by a depth of 20 in. without touching the inflammable cargo. It is calculated that dues to the amount of £60,000 per annum will be paid by this traffic through the canal.

WE learn that Mr. W. T. Lord, who was until recently outside representative of Messrs. Argylls London, Ltd., has just been appointed by Messrs. Sidney Straker and Squire, Ltd., to the management of their light vehicle department. New show-rooms and offices have very lately been opened at 75, Shaftesbury Avenue, London, W.C., where the firm handle the French built "C.S.B." (Cornilleau and St. Beuve) car and the new Straker Squire all-British vehicle.

DURING the last few months, both abroad and at home, we have been riding about a good deal on our friends' six-cylinder Napier cars, and certainly have enjoyed the smoothness of running and also noticed the wonderful flexibility of the car on top speed. Our last ride was with Mr. Cecil Edge, and was to Acton Vale, to revisit the works where these cars are made. It is now nearly two years since our last visit, and the expansion of the works we found to be truly remarkable. Nearly three thousand men are employed, and the works' management showed, like the car, its smooth running.

A MEETING of the Council of the Society of Motor Manufacturers and Traders was held on Thursday of last week, Mr. Sidney Straker in the chair. There were also present Messrs. Burford, T. B. Browne, R. Burns, Clarkson, Coleman, Edge, Gascoine, Goodchild, H. Johnson, C. Johnson, Lanchester, E. Powell, Sturme, Swindley, Stocks, F. R. Simms, and W. G. Williams. The uniform scheme of decoration for the November exhibition, prepared by Mr. Collett, President of the British Architects' Institute, was approved, and it was resolved to call an extraordinary special meeting to alter the portion of the articles of association governing the method of election of President of the society.

THE VAGARIES OF MOTOR VEHICLES.

BY A. J. MCKINNEY.

(Concluded from page 148.)

MUCH trouble was caused recently by the induction pipe becoming fractured just inside the flange where it is connected to the carburettor. The effect of the extra air taken in by this opening was not apparent until full gas was given or a high speed was reached. Then, owing probably to the increased amplitude or a certain synchronisation in the vibrations, the mixture would be disturbed and a series of gurgles and splutterings took place. This took over a week to discover, owing to the situation and nature of the crack. A friend removed his petrol tank from under the front seat to the back one, placing it at the same height above the frame as before. The first time he came to a hill of 1 in 9 the car stopped; the carburettor was empty, and yet there was a good supply in the tank. He was unable to fathom the mystery until it was pointed out to him that he had decreased the head of the liquid when the car was ascending an incline by this increase of the distance between the tank and the carburettor. Another friend, connected with a well-known Belgian car, was driving one up a hill in Surrey when the fuel

who had been compelled to spend three nights at a Sussex village because his machine would not fire in spite of all that could be done. I found that he had a De Dion coil, which was fixed to the frame of the machine. His mackintosh was strapped round it and was wet owing to a heavy storm through which he had ridden. This was the cause of the trouble, as the damp garment caused a short in the coil casing, and the flash could be seen from behind, while the rider vainly pedalled the machine on the stand.

An engineer recently asked one of his men to take down the live axle of his car for cleaning purposes. When re-assembling, the mechanic interchanged the two portions of it, so that the left hand portion was put on the right hand side, and *vice versa*. This gave three speeds backwards and only one forwards!

Owing to a leak appearing between the induction pipe and the carburettor, so that little gas could be drawn into the engine, a local man from a village in Kent was requisitioned to cut a new washer. He was very eager to help and most obliging, and worked like a Trojan for two days trying his very best to make the engine fire. But when the owner returned to drive his car home this man had to confess that he had not met with any success. The whole laborious operation was gone through again, until finally the induction pipe was disconnected from the carburettor,

The Duke of Bojano on the Benz Car he drove in the Targa Florio Race.

(See page 180.)

supply fell too low to enable it to reach the carburettor. He was a smart man, for he immediately turned the car round and went up triumphantly—backwards.

Further troubles are caused by the lubricating system. Sometimes a cock shakes open, or a leak is sprung, or the feed pipes become choked or refuse to pass the oil in cold weather. Nearly two years ago I carried about with me an envelope with a little grey dust in it, which I displayed to wondering friends. This represented the crank-shaft and big end bearings of a twin-cylinder engine, which had been reduced to this state either through some fault in the system adopted on that machine for its lubrication, or owing to the bad quality of the oil. Many a time, too, has the ardent motorist been delayed by the vagaries of the ignition system. It may be the hard-working magneto that strikes, or the coil that shorts, &c. One weak feature is the use of a chain for driving the magneto. If this breaks or jumps off, in most cases it is very difficult to replace exactly, owing to there being no indication of the correct timing given to meet such a case. A leak in the petrol tank washed some of the paraffin wax from the inside of a coil, which gave rise to weeks of trouble owing to the innocent appearance of this member. About seven years ago I came across a motor-cyclist

when the cause of the trouble was discovered. The local repairer had used a disc of soft copper for the washer, and had forgotten to cut the centre out!

There are numerous other troubles which occur when motor vehicles are used that are very familiar to most of us; yet, after all, they are simple enough to the man who understands his machine, especially when the cause is found out, but there is now little that is mysterious, as a knowledge of petrol engines is very widespread and enables us to laugh at what once was the source of great irritation and annoyance.

AN attractively illustrated booklet comes to hand from Mr. W. F. Peare, who has been identified with the motor movement in Ireland since 1899, when he commenced motor-car repair work at Waterford. In the following year he supervised the overhauling of a Panhard car for Sir William Goff, Bart., the present chairman of the Irish Automobile Club, and since then he has advised many of the Irish nobility in motor matters. The booklet contains some interesting photographs of motoring scenes about Waterford, and an account of Messrs. W. F. Peare and Co.'s establishment for the repair and storing of automobiles.

THE TARGA FLORIO RACE.

THE second race for the trophy known as the Targa Florio, presented by the Chevalier Vincenzo Florio, was run off on the Island of Sicily on Sunday last. The conditions under which the event was held provided for four-cylinder cars having a minimum cylinder bore of 120 mm. and a maximum of 130 mm., or for six-cylinder vehicles of minimum and maximum cylinder diameter of 85 mm. and 90 mm. The weight of the machines was in proportion to the bore, at the rate of 1,000 kilogs. for 120 mm. bore, with an additional 20 kilogs. for each mm. above this. For six-cylinder cars the weight was 1,000 kilogs. for 85 mm. cylinder diameter, and 40 kilogs. per mm. in excess. The contest was held over a 150 kilometre course, which, starting at Bonfornello, took in Cerda, Castelbuone, Petralia, Castellana, and Caltavuturo, this being covered three times to give the total distance of 450 kilometres. Much greater interest was taken in the event than last year, when there were only ten starters, for no less than fifty-four entries had been received, and of these the following forty-six actually started in the order named:—

No.	Car.	Driver.	No.	Car.	Driver.
1.	Pilain	Salvioni.	24.	Isotta-Fraschini	Minoia.
2.	Opel	Opel.	25.	Junior	Gremo.
3.	Darracq	Wagner.	26.	Bayard-Clement	Gauderman.
4.	Zust	Maggioni.	27.	Berliet	Porporato.
5.	Rapid	Ceirano.	28.	Lorraine-Dietrich	Gabriel.
6.	Isotta-Fraschini.	Trucco.	29.	De Luca-Daimler	Hemery.
7.	Junior	Tolotti.	30.	Radia	Marnier.
8.	Bayard-Clement.	Garcet.	31.	Suddeutsche.	
9.	Berliet	Rigal.		Fabrik	Hubel.
10.	Lorraine-Dietrich	Duray.	32.	Gobron	Faure.
11.	De Luca-Daimler	Ison.	33.	Fiat	Nazzaro.
12.	Diatto-Clement	Buzio.	34.	Itala	Fabry.
13.	Radia	Gaste.	35.	Benz	De Bojano.
14.	Suddeutsche.		36.	Zust	De Zara.
	Fabrik	Hieronimus.	37.	Rapid	Carliolano.
15.	Gobron	Dureste.	38.	Isotta-Fraschini	Sorel.
16.	Fiat	Lancia.	39.	Junior	De Martino.
17.	Itala	Cagno.	40.	Bayard-Clement	Collinet.
18.	Ajax	Caspar.	41.	De Luca-Daimler	Hubertot.
19.	Benz	Erle.	42.	Gobron	Douet.
20.	Pilain	Pizzagalli.	43.	Fiat	Weillschott.
21.	Darracq	Hanriot.	44.	Benz	Spamann.
22.	Zust	Conti.	45.	Zust	Capuggi.
23.	Rapid	Gallina.	46.	Isotta-Fraschini	Tamagni.

The start took place at 5.40 a.m., a little later than at first arranged, owing to the light not being good, but as the day wore on the weather improved considerably. The cars were sent away at intervals of three minutes, the last man being off at 7.55, just 2 hrs. 15 min. after Salvioni on the Pilain, who was first away. Tamagni had only just left when the approach of a competitor was heralded; it proved to be Opel, who had started second, with Wagner close on his heels. Nine cars broke down in the first round, among them being Hieronymus (Suddeutsche Fabrik car) with three broken wheels; Porporato (Berliet), broken axle; Rigal (Berliet), who had been a strong favourite before the race, with a damaged wheel; Hubel (Suddeutsche); and Salvioni (Pilain); the latter abandoning owing to running into a ditch. The times for the second round gave Trucco (Isotta-Fraschini) first, with Lancia (Fiat), Cagno (Itala) and Nazzaro close up in the order named, the first French car—the Darracq driven by Wagner, being sixth. The latter was, however, travelling well, and was the first to complete the second round, although he was still, on time, about three minutes behind Nazzaro, who had run into the premier position, with Lancia third and Duray fourth, the latter having advanced from twelfth place at the end of the first lap. The last circuit unfortunately saw the retirement of Wagner and several other competitors. Duray (Lorraine Dietrich), who had started eleventh, was the first to actually complete the race, he being followed by Lancia, Garcet (Bayard-Clement) and Nazzaro, the final classification, however, having regard to the starting and finishing times, being as shown in the appended table:—

No.	Driver and Car.	Time.
1.	Nazzaro (F.I.A.T.)	8 17 36
2.	Lancia (F.I.A.T.)	8 29 29

No.	Driver and Car.	Time.
3.	Fabry (Itala)	8 32 40
4.	Duray (Lorraine-Dietrich)	8 39 7
5.	Cagno (Itala)	8 39 16
6.	Gabriel (Lorraine-Dietrich)	8 39 46
7.	Tamagni (Isotta-Fraschini)	8 41 45
8.	Weillschott (F.I.A.T.)	8 42 52
9.	Sorel (Isotta-Fraschini)	8 52 52
10.	Garcet (Bayard A. Clement)	8 53 14
11.	Minoia (Isotta-Fraschini)	8 53 19
12.	Maggioni (Zust)	9 0 7
13.	Ison (De Luca-Daimler)	9 1 22
14.	Dureste (Gobron)	9 10 24
15.	Erle (Benz)	9 11 15
16.	Gremo (Junior)	9 13 38
17.	Spamann (Benz)	9 15 56
18.	Buzio (Diatto-Clement)	9 20 5
19.	Gauderman (Bayard-Clement)	9 29 4
20.	Hubertot (De Luca-Daimler)	9 32 20
21.	Collinet (Bayard-Clement)	9 38 25
22.	Gallina (Rapid)	9 50 10
23.	De Bojano (Benz)	9 52 40
24.	Hemery (De Luca-Daimler)	10 16 20
25.	Capuggi (Züst)	10 32 30
26.	Gaste (Radia)	10 33 25
27.	Faure (Gobron)	11 17 25
28.	Pizzagalli (Pilain)	11 21 53

Nazzaro, whose time works out at 33½ miles per hour, secures the Targa Florio, as also a money prize of £600; the second man receives £320; the third, £160; the fourth, £80; and the fifth, £40; while all who finished will receive a replica in silver of the Targa as a souvenir of the race. The subjoined table shows the number of cars of each nationality that started, as also those that finished, from which it will be seen that the contest was a keen struggle for supremacy between France and Italy, the result of the race being, however, a distinct victory for the Italian vehicles, which secured four of the first five places, the honour of the first two falling to the credit of the Fiat Company. The performance of the De Luca-Daimler cars, which were built in Coventry, and run by the De Luca-Daimler concern, which is preparing to build the Daimler vehicles in Italy, is also noteworthy, especially when it is remembered that the machines were practically 30-h.p. touring car models equipped with racing bodies.

AN ANALYSIS OF THE RESULTS.

Car.	Number Started.	Number Finished.
Fiat	3	3
Itala	2	2
Isotta-Fraschini	4	3
Zust	4	2
Rapid	3	1
Junior	3	1
Diatto-Clement	1	1
Total Italian cars	20	13
Pilain	2	1
Darracq	2	—
Bayard-Clement	3	3
Berliet	2	—
Lorraine-Dietrich	2	2
Radia	2	1
Gobron	3	2
Total French cars	16	9
Opel	1	—
Suddeutsche Fabrik	2	—
Benz	3	3
Total German cars	6	3
De Luca Daimler	3	—
Total British cars	3	3
Ajax	1	—
Total Swiss cars	1	—

UP to the 17th inst. the 40-h.p. Siddeley car now under observation by the Royal A.C. had travelled 8,069 miles, of which 5,155 miles had been run without an involuntary stop.

CONTINENTAL NOTES.

A Voiturette Race in Sicily.

The automobile meeting in Sicily opened on Thursday last week with a race for voiturettes having single-cylinder engines of from 85 to 120 mm. bore, or two-cylinders between 70 and 90 mm. bore. The contest was held over the Targa Florio course, two laps being made to give a total distance of 300 kilometres (187½ miles). Twenty-two entries had been received, but of these only fourteen started, viz., eight De Dions, three Lion-Peugeots, two Sizaire-Naudins, and a Florentia. The event proved a victory for one of the Sizaire-Naudins, which, driven by M. Naudin, covered the distance in 7 h. 47 min., equal to an average speed of twenty-four miles per hour. The second, third, and fourth places were all taken by De Dion vehicles driven by Count Vincenzo Florio, M. Stabile, and M. Mollica, the times being respectively 8 h. 2 min., 9 h. 10 min., and 11 h. 31 min. Out of the fourteen starters, only four succeeded in making the two rounds.

A Spring and Elastic Wheel Competition.

The annual spring and elastic wheel competition organised by the "Auto" commenced on Monday last, and will extend

The A.C.F. Grand Prix Race.

The ballot for the order of starting in the Grand Prix race on July 2nd next took place last week, with the result as shown in the appended table. It was also decided by the Sporting Commission of the A.C.F. that the vehicles shall bear a distinctive sign on the day of the race in order that they may be readily recognised, this being given in the fourth column.

Order of Starting.	Car.	Driver.	Distinctive Sign.
1	Fiat	Lancia	F-1
2	Corre	D'Hespel	C-1
3	Darracq	Wagner	D-1
4	Lorraine-Dietrich	Duray	L-1
5	Porthos	Stricker	P-1
6	Dufaux-Marchand	F. Dufaux	DM-1
7	Bayard-Clement	A. Clement	BC-1
8	Motobloc	X.	MB-1
9	Renault	Sisz	R-1
10	Germain	Degrais	GE-1
11	Panhard-Levassor	Le Blon	PL-1
12	Walter Christie	Christie	WC-1
13	Mercedes	Jenatzy	M-1
14	Weigel	Lee Guinness	W-1
15	Gobron-Brillie	X	GB-1
16	Aquila-Italiana	Richat	A-1
17	Brasier	Barillier	B-1

Nazzaro, the winner of the Targa Florio Race, on his Fiat Car.

until the 25th inst., during which time the cars to which the arrangements are fitted will be driven from Paris to Nice and back, a total distance of 2,080 kilometres. Altogether thirteen entries were received as follows:—

No.	Tyre or Wheel.	Car on which same are fitted.
1.	Soleil wheel	Rochet-Schneider.
2.	Ducable tyre	24-h.p. De Dion.
3.	Sider tyre	Mors.
4.	Elastes tyre	Berliet.
5.	E L wheel	Gobron.
6.	Securitas tyre	Radia.
7.	Cosset wheel	Panhard
8.	Ducable tyre	Mors.
9.	Elastes tyre	Cornilleau Ste. Beuve.
10.	E L wheel	Delaunay-Belleville.
11.	Ducable tyre	8 h.p. De Dion.
12.	Elastes tyre	Motobloc.
13.	Elastes tyre	Demester.

Each car is carrying an observer, who is required to keep a record of all stops and breakdowns. Nice was safely reached by eleven of the competitors on Thursday, the 18th inst., who were given two days' rest, the cars meanwhile being placed on exhibition. The return journey was commenced on Sunday, and by the time these lines are in print the vehicles will be safely back in Paris.

18	Fiat	Nazzaro	F-2
19	Darracq	Hanriot	D-2
20	Lorraine-Dietrich	Rougier	L-2
21	Bayard-Clement	Garcet	BC-2
22	Motobloc	X.	MB-2
23	Renault	Edmond	R-2
24	Germain	Roch-Brault fils	GE-2
25	Panhard-Levassor	Heath	PL-2
26	Mercedes	Werner	M-2
27	Weigel	Weigel	W-2
28	Brasier	Baras	B-2
29	Fiat	Weillschott	F-3
30	Darracq	Demegoot	D-3
31	Lorraine-Dietrich	Gabriel	L-3
32	Bayard-Clement	Gauderman	BC-3
33	Motobloc	X.	MB-3
34	Renault	Riches	R-3
35	Germain	Perpere	GE-3
36	Panhard-Levassor	Dutemple	PL-3
37	Mercedes	W. Poegge	M-3
38	Brasier	Bablot	B-3

The first car will be sent off at 6 a.m., the others following at minute intervals. The vehicles which the Brasier Company are building for the contest will be fitted with four-cylinder engines, 165 mm. bore by 140 mm. stroke. The cars are nominally rated at 110-h.p., and will be fitted with low-tension.

magneto ignition, three speeds and reverse and side chain transmission.

Imprisonment for Emitting Smoke.

The police authorities in Paris are taking energetic measures to put a stop to the unpleasant emission of smoke by motor-cars owing to careless lubrication, and quite recently M. Fallot, a director of the Peugeot Co., has been sentenced to a day's imprisonment for causing a nuisance of this kind. As M. Fallot was not driving the car and was not responsible for the smoking, the matter has been brought before the French Chambre Syndicale d'Automobile, which has adopted a resolution protesting against "such abusive extension of employers' responsibility," and has decided to take the necessary steps to bring the injustice before the notice of the authorities.

A Calais-Boulogne Automobile Meeting.

In conjunction with the Belgian Criterium International, which is to be held in July next, the Automobile Club du Nord de la France is organising a series of motor events, which will take place near Calais and Boulogne. During the course of the run from Ostend on July 17th there will be a flying kilometre trial on the level at Gravelines, and a hill-climbing competition over the same distance for the Hector Franchomme Cup. On the following day a touring contest for the Caramain-

A Swiss Hill-Climbing Competition.

The Swiss Automobile Club is organising a hill-climbing competition for motor-cars and cycles for the Monod Cup for May 28th. The course is from Allstatten to the Ruppenhohe, the distance being $8\frac{1}{2}$ kilometres, and the average gradient 6.7 per cent. The rules provide that single and double-cylinder cars must carry two persons, and those having engines with more than two cylinders four persons. The classification will be

made on the formula, $M = \frac{T \times C}{P}$ where T is the time in seconds occupied in making the ascent, C the total cylinder capacity in litres, and P the total weight of the car in running order and including passengers. The first place in each category will be awarded to the vehicle which shows the lowest value for M.

Motor Car Regulations in Madrid.

Some new regulations with regard to motor-car traffic have just come into force in the Spanish capital. They provide, among other things, that all drivers of motor vehicles must procure a licence, that the speed in crowded thoroughfares must not exceed 10 kilometres ($6\frac{1}{4}$ miles) per hour, and that the pace must be slowed down when any frightened horses are encountered. The use of glaring headlights and noisy sirens is prohibited.

The Two Motor-Buses recently supplied by Messrs. Stoewer Gebrüder, of Stettin, Germany, to the Allgemeine Potsdamer Automobil Omnibus Gesellschaft. The vehicles made the journey from Stettin to Potsdam, near Berlin, by road, the photo from which the above illustration is reproduced being taken en route.

Chimay Cup will be run off near Boulogne, and on July 19th there will be a hill climb at Tuigny and a run to Calais.

Belgian Motor-Car Imports and Exports.

The value of the motor-cars and parts exported from Belgium during the first quarter of the current year only amounted to £78,640, as contrasted with £91,452 in the corresponding period of last year. There has also been a falling off in the imports of foreign automobiles and components into Belgium from £40,880 in the first three months of 1906 to £37,456 in the quarter recently ended.

A German Light Car Touring Competition.

The German Motor Union is organising an international touring competition for light cars for the 6th, 7th and 8th May. The competing vehicles, which must be in touring trim, will be divided into three classes, as follows:—(1) Cars listed up to £150; (2) cars listed from £150 to £225; and (3) cars listed from £225 to £300. The first day's run is from Dresden to Nauen (Berlin) 270 kilometres; the second from Nauen to Kiel, 285 kilometres; and the third from Kiel to Hanover, 240 kilometres. We may add that the entry list closes on the 30th inst., and that full particulars of the competition can be obtained from the Deutschen Motorfahrer Vereinigung, 2 Viktoriastrasse, Munich 23.

Public Services in Germany.

A concession has been granted to run a motor-omnibus service between Karlsbad and Pirckenhammer. A company is also being formed to establish a similar service between Bremerhaven and Geestemünde.

Miscellaneous Items.

A syndicate has been formed at Castelnau-Magnoni (Hautes Pyrenees) to establish a public motor-car service between that town and Auch.—A Werner 7-h.p. two-cylinder car is at present engaged on a tour of France. So far it has covered 1,500 miles without trouble of any kind.—L'Association Amicale des Automobilistes Militaires du Gouvernement Militaire de Paris is the name of a new society which has just been formed in the French capital, the membership being confined to those motorists and motor-car drivers who are on the French territorial army reserve list.—It has been decided that the start of the race for the Kaiser's Prize on June 14th shall take place at 6 a.m., so that the contest can be finished not later than 3.30 p.m.—The Municipal Council of Paris has appointed a special commission to visit England to inquire into the various types of motor-omnibuses in service in London, and the cost of operation of the same.—The marriage took place at Neuilly on Friday last week of M. F. Charron, of the C.G.V. Company, to Mlle. Jeanne Clement, the daughter of Mr. A. Clement, the builder of the well-known Clement-Bayard cars.

ON Monday a 30-h.p. six-cylinder Brooke car started on a thousand miles Long Distance Trial under the observation of the Royal A.C.

A NEW company, on the directorate of which are Messrs. J. C. Shannon and A. J. Llewellyn, of Walsall, has been formed with a capital of £60,000, to introduce the motor industry into the town of Walsall.

THE Fiat Company have just made delivery of a six cylinder car to King Alfonso of Spain.

THE public library authorities of Chicago have placed their fifth motor-van in service for the distribution of books to the sub-stations.

A VISIT to four of the leading coach-builders just before Easter showed that they had on their premises 130 motor chassis awaiting delivery.

LORD PLUNKET, the Governor of New Zealand, and the Attorney-General, the Hon. Dr. Finlay, both own Argyll cars, the former generally driving himself.

MR. J. C. BEADLE, of Dartford and Foot's Cray, has a spacious garage, with inspection pits and repair works, in Lowfield Street, in the former town.

THE six-cylinder Hotchkiss car which has made a 10,000 kilometre journey through France will shortly undertake a long-distance tour in this country under official observation.

THE Lancashire Steam Motor Company have just supplied two steam wagons to the British Admiralty for use in connection with the conveyance of sailors' kits to the railway stations at Portsmouth.

THE City Tyre Company, of Brooke Street, Holborn, E.C., are agents for the Avon motor tyres, and are also undertaking the repair of tyres of all makes—work for which they have excellent facilities.

THE value of the motor-cars and parts exported from France during the first two months of the current year amounted to £908,960, an increase of £9,600 over the corresponding period of 1906.

MR. J. ORDE, the Secretary of the Royal Automobile Club, in company with Mr. Wylie, the Traffic Superintendent of the London and Brighton Railway, on Sunday last visited the course, near Dieppe, on which the race for the A.C.F. Grand Prix is to be held.

MESSRS. BROWN BROS., LTD., have despatched four of their Brown 20-22-h.p. cars to Ireland for the use of the Royal Commission on Congestion, which cars, with the members of the Commission, were at Sligo up to April 24th, and will be at Carrick-on-Shannon up to April 29th.

THE value of the motor-cars and parts exported from the United States of America during February last is returned at £88,740, as against £66,542 in the corresponding month of last year. The United Kingdom heads the list as being America's best customer, this country being responsible for £20,012 of the total.

AMONG the sales recently effected by the Kellow Motor Company, of Melbourne, were the following:—A 10-12-h.p. Talbot, to Mr. Beddome, of Tasmania; and three 10-12-h.p. Coventry-Humbers, to respectively Dr. Wolfhagen, of Tasmania, Dr. Horne, of Broken Hill, and Professor Lyell, of the Melbourne University.

FOR the third time within the last eighteen months the New Motor and General Rubber Company, Ltd., of 374, Euston Road, London, N.W., have taken larger premises, and in their factory at Harpenden will manufacture a special tyre as well as the Rub Metal Non-Skid with which they have been so favourably identified. Here the company have an experimental room under the supervision of an expert, whose services will be at the disposal of the trade in connection with the development of new ideas. The works are complete throughout, and, in fact, it may be said that the New Motor and General Rubber Company, Ltd., do everything for the tyre with the exception of growing the rubber.

THE recent increase in the price of petrol in this country is being reproduced in India, and a further rise is, we learn, not unlikely.

CONVENIENTLY situated for visitors, being opposite the Post Office at Canterbury, the new garage of the Canterbury Motor Company will doubtless be appreciated by many visitors to the Cathedral city.

THERE are few who are more devoted to motoring or who make more use of their motor-cars than the Rt. Hon. Lord Battersea, who, owing to the satisfaction derived whilst making many extended tours through Europe, during the last two years, in his six-cylinder Napier, which is fitted with a comfortable five-seated touring body, recently ordered and has just taken delivery of one of the latest type 40-h.p. six-cylinder chassis of the same make. The vehicle is, as will be seen from the accompanying illustration, fitted with a luxurious two-seated body, which was specially designed by the owner for touring on the Continent, and gives evidence of the latest type of touring car coming into vogue, for those who are really keen on motoring for the enjoyment and sport they obtain from driving.

It seems likely that we may in the near future see a larger number of this type of simple touring carriage in use amongst the ever-increasing number of motorists who have discovered the delight and freedom to be obtained from travelling about from place to place and seeing to the best advantage the many beauties of different countries by means of their touring motor-carriage. It will be noticed that the back portion of Lord Battersea's car provides ample closed-in space for personal luggage, and that it is built on graceful lines. The vehicle is painted in a shade of light grey, relieved by dark lines and mouldings, and the light canvas hood can be so arranged by the addition of side-curtains as to entirely protect the occupants from the weather when required.

THAT there are many things which may happen to a car without putting it out of commission, if a little ingenuity be exercised, was, states the "Automobile," of New York, well proved by a rural motorist in Michigan during one of the cold snaps of the past winter. He was located eight miles from the nearest repair shop, and one night the radiator of his car froze solid. He wished to use the vehicle the next morning, but did not care to run the risk of increasing the damage, so he rigged up a home-made cooling system. A cider keg full of water was placed on one of the front seats and a piece of garden hose led from it to the cold water intake of the cylinder jackets. The drain cocks of the latter were opened sufficiently to let the water drip out of them fast enough to keep the engine cool, so that the trip was made successfully, and another "useful hint" added to the breviary of the automobilist.

MR. ALBERT HOUSE held his monthly motor-car auction at the Oak Lane Garage, Bradford, on Tuesday last.

EVERY event of the Hertfordshire Motor Cycle Club's Hill Climb at Aston Hill, near Tring, was won on Dunlop tyres.

MESSRS. J. THOMSON AND SON, of the Castle Works, Lady Lawson Street, Edinburgh, are the Scottish agents for the Harvey Frost vulcanisers and vulcanising materials.

A View of Messrs. West's, Ltd., Erecting Shop. (See page 185.)

MR. CHARLES CORDINGLEY has been elected to the Board of Messrs. Wyman and Sons, Ltd., the well-known Government publishers and printers.

THE East Indian Railway Company have arranged to import a considerable number of petrol lorries for use in connection with their line.

THE Palmer tyres fitted to the 40-60-h.p. Gobron-Brillie car used on the London-Paris motor service behaved excellently on the inaugural run.

H.H. THE MAHARAJAH SCINDIA has recently placed an order for two more cars, the first being a 14-16-h.p. Fiat with a special landaulet body, and the second a new Siddeley car.

MOTOR-CARS are no respecters of persons. The other day the Bishop of Ely was motoring to officiate at a wedding when the car broke down and prevented his arrival at the church in time for the ceremony.

A MOTOR fire engine belonging to the London Fire Brigade was shown by Messrs. H. Simonis and Co., in the yard of the Manchester chief fire station. It consisted of an ordinary horse engine converted into a motor-vehicle.

THE hill out of Llangollen on the direct road to Glyn Cerriog is said by Mr. W. P. Cook, of Liverpool, to have not yet been surmounted by a motor-car. The distance is three miles, roughly divided into one mile climb, one mile level, and one mile descent, and the hill is very steep (about 1 in 4), with two awkward corners to add to the difficulty.

FROM Messrs. Archibald Ford, Ltd., 109, Bold Street, Liverpool, come interesting pamphlets concerning their British School of Motoring, their tyre accessory department and Darracq agency. Each department is under the direction of an expert, with Mr. Archibald Ford generally supervising the whole concern, which has also a branch at 292, Deansgate, Manchester.

THE Touring Club of Italy is issuing a series of sectional maps of the country, which can be well recommended to any motorist contemplating a tour in Italy. Each of the maps is accompanied by an alphabetical index to the towns, with an indication to facilitate reference to the same. The maps we have received are those referring to the districts surrounding Genoa, Turin, Milan, and Venice.

THE second automobile show in Montreal, under the auspices of the Automobile Club of Canada, was held last month.

CONGRATULATIONS to Mr. T. Overton on his marriage with Miss Hills, at the Parish Church, Sutton, on Wednesday of last week.

IT is reported that the Kaiser has placed an order with the German Daimler Company for a Mercedes six-cylinder car, which is to be fitted with a landaulet body.

MESSRS. ASHFORD AND PITT have opened the Central Marylebone Garage at 300, 302 and 304, Marylebone Road, London, W. This establishment is near the Great Central Hotel, and will accommodate nearly fifty cars. Messrs. Ashford and Pitt inform us that they will devote special attention to repair work, and have been appointed by the patentees to fit the Gillett-Lehmann carburettor controller.

WE mentioned in a recent issue that as a result of the increasing demand for the Iris cars made by Messrs. Legros and Knowles, Ltd., of Cumberland Park, Willesden Junction, a new company, with the title Iris Cars, Ltd., had been formed to establish a depot in London, where the sales department of the business will in future be conducted. After some delay extensive premises were secured in Bird Street, Oxford Street, W., and these, after having been specially fitted out as motor showrooms, were officially inaugurated on Monday last. The new depot, of which we give an illustration herewith, is situated at the corner of Bird Street and Barrett Street, and is in the same building as the "Times" Book Club. It comprises a spacious showroom capable of taking half a dozen cars. An 18-foot lift has been installed, this being on somewhat novel lines, the central portion being built in the form of a turn-table, thus facilitating the handling of cars. The lift space is independent of the showroom, and has a separate entrance for the cars. On the same floor is a well-appointed board room, the secretary's private office, and a correspondence department. Below is a large basement capable of storing over a dozen cars. A washing space is provided, also a large storeroom and a foreman's office. While the more important class of repairs will still be carried out

at the works at Willesden Junction, plant for effecting small adjustments and replacements is being installed at the new depot, which is well lighted by powerful arc lamps. We may add that the chairman of Iris Cars, Ltd., is Mr. Arthur Dugdale, of Castle Hill, Tutbury, Staffs., a well-known Lancashire cotton-spinner. Mr. Arthur E. Perman, who has been associated with the Iris vehicles since their introduction, is the managing director, while Mr. A. Colbourne has been appointed sales manager.

THE WEST-ASTER CARS.

ESTABLISHED some years, under the works management of Mr. E. J. West, whose connection with the automobile industry extends back to the early days of the modern movement, Messrs. West, Ltd., have already built a large number of vehicles, as well as a considerable quantity of axles, gears, &c., of which they have made a speciality. Hitherto, however, the business has mainly been done with what we may term trade buyers, who have themselves chosen the

Fig. 1.—The West 20-22-h.p. Landulet recently supplied to General Davies, of Elmley Castle, Worcestershire.

names for the cars, with the result that the excellent reputation they have earned for reliability has not, perhaps, made itself so well known with the general public as it has in business circles. The directors have, however, recently decided upon a new policy—that of appealing more directly to private motorists—and, with the view of demonstrating the leading features of the West-Aster cars, and the facilities available for the construction of the same, we were, in company with a number of Press representatives, afforded an opportunity on Thursday, last week, of inspecting, under the guidance of Col. Jopp (one of the directors) and Mr. P. Lamb (the sales manager), the works of the company, which are situated in Foleshill Road, Coventry. Although as yet they cannot compare in size with other important factories in the Midlands we have lately visited, we found a conveniently arranged single-storey building, divided into a number of departments, including a large machine shop well equipped with electrically-driven tools of the latest type, forge, erecting shop, repairs department, stores, &c. The chassis erecting section, of which we give an illustration on page 184, is the latest addition to the works, and at the time of our visit close upon a dozen vehicles were in course of completion.

For the current year four sizes of touring and town vehicles are being turned out—10-12-h.p. two-cylinder and 15-h.p., 20-22-h.p., and 24-30-h.p. four-cylinder. The name West-Aster, by which the cars are known, is derived from the fact that the company have adopted the well-known Aster engines as their standard, although at the same time they are willing to fit an engine of any desired make according to the requirement of clients, evidence of this being found in the fact that one of the vehicles in hand at the time of our visit was being furnished with a White and Poppe motor. Without going on the present occasion into the exact details of the different models, we may state briefly that they are all of the live-axle type, the engine and change-speed gear being carried on a sub-frame suspended from the main frame, which is of the usual pressed steel form. The lubrication of the engine is effected by a small plunger pump, this being located in a small tank fixed on the side of the engine. The pump, which is driven off one of the cam shafts, forces the oil to a neatly-arranged sight feeder on the dashboard, whence it flows to the different parts of the motor. The clutch is of the leather-faced cone type, with cork inserts

the latter, which consists of sections of cork of about the size of a halfpenny piece let in the leather, are claimed to allow the clutch to take up the load gradually and without shock of any kind. The gear-box, the shafts of which run on ball bearings, is adapted to give three speeds forward and a reverse, with direct drive on top speed, through a cardan shaft and bevel gear, to the live axle. The various speeds are controlled by a lever working in a "gate," and connected up to a special gear "selecting" box, which is so arranged that all the bars except the one in operation are locked in position.

The cardan shaft is enclosed in a sleeve which, in conjunction with the anchored springs, acts as a torque rod. It is provided at its forward end with a special form of universal joint, as also a sliding one; the former is illustrated in Fig. 2; a noteworthy feature being the provision for lubrication, which greatly adds to its useful life; an oil well is formed in the centre of the four pivots, which have a small hole in their centre down which the lubricant passes to the bearing surfaces. As the oil is prevented from leaking by means of neatly-arranged cups, it is claimed that one filling of the small well will suffice for about 2,000 miles running. The cardan sleeve is built up with the differential case, and ball bearings are provided at both ends so that the driving pinion is rigidly held up to its work. The cardan sleeve is provided with an arrangement which, acting as a shock absorber, considerably reduces the strains ordinarily thrown on this part of the casing. It consists of a stirrup attached at its lower end to the upper side and centre of the sleeve, and connected at the other with a spring bracket supported in one of the cross members of the frame. The axle itself is a well designed and constructed piece of work; it has only the driving strain to withstand, it being surrounded by a casing on which the road wheels run on ball bearings, the power being transmitted from the axle to the wheels by means of dog clutches in the hubs. The casing is built up in two halves of weldless steel tubing, each half being in one piece with its flange. Other features of interest, and which also show the attention paid to details in the West factory, include the provision of ball joints to the radius rods, and the strong and substantial method of supporting the shoes of the foot-brake.

In addition to pleasure cars, the company are also devoting attention to commercial vehicles, and hope to have their first machine on the road within a few weeks' time. Provided with

Fig. 2.—The West Universal Joint, Brake Drum and Ratchet Surag.

an engine of 15-h.p., and designed for loads up to 30 cwt., it will vary from the touring vehicles in that a worm drive to the rear axle is being adopted.

From the foregoing it will be seen that not only are the West-Aster cars built on modern lines, but that they possess many interesting features of their own, which have only been adopted after exhaustive trial; and now that efforts are being made to bring them directly before the notice of the motoring public, we doubt not that the merits of the West-Aster vehicles will quickly be appreciated.

The Cordingley Show.

(Continued from page 167.)

HEREWITH we nearly complete, with the exception of the petrol-electric vehicles, and other novelties reserved for our next issue, our report of the Cordingley Show of 1907—from the business point of view as successful as ever and full of encouragement to those firms that have already booked spaces for the 1908 display, which will be held from March 21st to 28th, at the same place as all previous exhibitions of this series of pioneer motor shows.

PETROL VEHICLES.

The Riley Cars.

A new comer to the Cordingley Show was the RILEY CYCLE COMPANY, LTD., Coventry, who had on view two interesting vehicles of respectively 9-h.p. and 12-h.p. We give a view of the chassis of the latter in Fig. 52, from which it will be seen that the engine, which is

carried by the axle sleeve. The frame, which is supported on five springs is of pressed steel, the side members being parallel throughout their entire length and raised at the rear to give clearance for the differential casing. The engine and gear-box are carried on a sub-frame of channel steel. A simple but useful feature is found in the fact that the supports for the side steps of the car do not consist of brackets attached to the side members of the frame in the usual way, but of bars which extend from one side of the chassis to the other. The petrol tank is built up to form a dashboard of the curved type. The wheel base of the chassis is such as to permit of a roomy side entrance body being fitted. The car is being put on the market at a moderate price, and is claimed to be not only exceedingly quiet in its operation but also free from vibration, so that it is deserving of close attention. The Riley Company also exhibited one of their 5-h.p. tri-cars, and an attractive two-seated vehicle of 9-h.p. The latter is an interesting production, the tubular frame being supported on inverted

Fig. 52.—Chassis of Riley 12-h.p. Car.

located under the bonnet in the usual way, comprises two cylinders, 4 in. bore by 5 in. stroke, set V shape, that is, at an angle of 90 deg. to each other. The valves are all m.o.v. and are interchangeable; the ignition is by coil and accumulators, and the water circulation on the thermosyphon principle, no pump being employed. The lubrication of the engine is maintained by the pump drive off one of the cam shafts, which forces the oil to a distributor. A single lever on the steering wheel controls both the ignition and throttle, the latter being also automatically acted upon by an automatic governor. The normal speed of the engine is 900 revolutions per minute, so that there is ample margin for acceleration. The clutch, which is of the expanding metal-to-metal type, is connected by a jointed shaft to the gear-box, which is adapted to give three speeds and a reverse, with direct drive on top speed. The gear is of the type in which the various pinions are always in mesh, the various pair being made to transmit the power by means of jaw clutches. The design is exceedingly neat and appears to be both effective and fool proof, as the lever can be passed from notch to notch in the quadrant without any trouble and without fear of stripping the gears. The clutches are actuated by spiral springs, and are held out of work by a sliding bar with notches in its side. As this bar is drawn along by the hand lever one or another notch comes opposite a projecting pin, which under the action of the spring is immediately forced into the notch, the engagement of the desired clutch taking place at the same time. From the gear-box, the shafts of which run on ball bearings, the power is transmitted through a cardan shaft and bevel gear to a live axle, which runs on ball bearings and which transmits its power to the road wheels through dog clutches in the hubs, the weight of the car being

and slightly shortened semi-elliptic springs, somewhat on the lines of the Lanchester vehicles. The engine, which is of the V-shaped twin-cylinder type, is located about the centre of the frame, under the body, which is hinged so that it may be tilted up to give access to the mechanism. The motor is set with its crank shaft parallel to the axle. On an extension of the shaft is mounted a leather-faced cone clutch and a three speed and reverse gear-box of the type above outlined, and a sprocket which, by a single chain, transmits the power to the rear live axle. The whole frame and body are carried within the wheel base, giving a low centre of gravity. The arrangement of the dashboard is somewhat novel; it extends at a sharp angle from the radiator to the steering wheel, the space below it being utilised for the oil reservoir and petrol tank. Altogether this little car is an interesting production and should meet the requirements of a large section of the motoring public.

The Universal Motor.

Prominent in the exhibit of Mr. JOHN GOODE, of Alderman's House, E.C., was a thirty-five-seated double-deck 'bus body built by the British Motor Body and Wheel Works, Ltd., of King's Cross, N., and intended to be fixed on a new chassis built by the All British Car Company, Ltd., which unfortunately met with a serious accident at the works a few days before the Show. One of its principal features is that the transmission gear is outside the frame, thus enabling the 'bus to be fixed considerably lower than usual, as the well of the vehicle occupies the space inside the frame usually taken up by the driving mechanism, thus lowering the height of the 'bus. This necessarily

lowers the centre of gravity, reduces the tendency to overturn, and increases the stability. Mr. Goode also displayed one of Sanderson's "Universal Motors," which is especially intended for use in rural districts, for ploughing, and driving all kinds of farm machinery. The machine is mounted on three steel wheels, the leading pair acting as drivers, provision being also made for the third wheel to be driven when necessary. Three speeds forward, of 2½, 3½, and 7 m.p.h., and reverse, are provided. A small flat platform is fitted to the machine,

so arranged that each may be taken out independently of the others. The carburettor is of a new design, the additional air supply for the mixture being regulated automatically by means of a small conical valve. The apparatus is much smaller and lighter than the one used on the 1906 cars, and is claimed to give more power, greater flexibility, and increased economy of fuel. On the smaller model thermo-syphon water circulation is employed; the larger car, however, has a centrifugal pump. The leather-faced cone type of clutch is retained

Fig. 53.—Chassis of Brasier 25-36-h.p. Car.

on which heavy goods may be carried. A variety of sizes are made, ranging in power from 15 to 50-h.p., the engines being fitted with a carburettor designed to use paraffin as fuel, petrol being employed for starting purposes. At this stand was also to be seen a universal gear, suitable for steering, lifting or hoisting machinery for ship or land purposes, and also for application to machine tools of all kinds. By this gear an indefinite range of speeds can be obtained, either direct or reverse, and the motion can be reversed while the gear is running.

The Brasier and Unic Cars.

The display of Messrs. MANN AND OVERTONS, LTD., included examples of the latest types of the well-known Brasier and Unic cars, for which they are British agents. Of the first-named vehicles those on view comprised a 16-26-h.p. chassis, a 25-36-h.p. landaulet, and a 25-36-h.p. landaulet limousine. A sub-frame of tubular construction is still employed to carry the engine and gear-box; the main frame is,

a double-jointed shaft connecting the clutch with the gear-box. The latter is adapted to give four speeds forward and a reverse, with single operating lever working in a "gate." On the top speed the drive is direct to the differential shaft, from which the power is conveyed to the rear road wheels by side-chains. The steering gear has been strengthened, and the steering column increased in diameter. Ball bearings are fitted to all parts except the engine. Each car is made in two lengths of chassis, so that any type of carriage body may be fitted. Turning now to the Unic cars, those exhibited included a 10-12-h.p. double phaeton with hood, and a 10-12-h.p. motor-cab, the latter being a duplicate of those now in service in London. The vehicle has already been described in the *M.C.J.*, so it will suffice to mention that the engine comprises two cylinders 102 mm. bore by 110 mm. stroke, and that the transmission is through a leather clutch, a ball-bearing gear-box giving three speeds and a reverse, and a direct drive on the top through a cardan shaft and bevel gear to the rear live axle.

Fig. 54.—Plan of Chassis of Royal Starling Car.

however, of pressed steel narrowed in front to increase the lock of the steering-wheels. The cylinders are cast in pairs, with the valves all arranged on one side; the dimensions of the 16-26-h.p. engine are 90 mm. bore by 120 mm., and of the 25-36-h.p. 112 mm. by 130 mm. stroke. The crank shaft is *desaxé*, that is to say, it is slightly out of line with the centre of the cylinders. Ignition is by low tension magneto, the operating shaft being located overhead with the strikers

The Starling and Royal Starling Cars.

The STAR CYCLE COMPANY, LTD., Wolverhampton, had on view a couple of examples of the Starling cars, which, in view of their relatively low price, have become a very popular type. The motive power is supplied by a 6-h.p. single-cylinder engine, driving through a three speed and reverse gear-box and a single chain to a live axle. With artillery wheels and a neat two-seated body, and sloping tool box

it forms a useful vehicle for the man of moderate means. The great feature of interest, however, was the new Royal Starling (Fig. 54) which has just been put on the market, and which throughout follows the lines of large touring cars. The engine comprises two vertical cylinders, $3\frac{1}{2}$ in. bore by $4\frac{1}{2}$ in. stroke, the valves being all mechanically actuated off a single cam shaft. The arrangement of the inlet pipe on is

Fig. 55.—The Back Axle of the Cadogan 16-20-h.p. Car.

somewhat novel lines; the carburettor is located on the right-hand side of the motor and the gas is conveyed therefrom by an oblong-section pipe between the two cylinders, and thence by a short vertical round pipe to the inlet valves. The latter are provided with a variable lift, by means of which the speed of the engine is controlled, this being obtained by a wedge piece which can be slid in and out between the cams and the valve tappets. The transmission is through a leather-faced cone clutch to a three speed and reverse gear-box, the shaft of which runs on Hoffmann ball bearings. The final drive is by a cardan shaft and bevel gear to a well-supported live axle, the latter also running on ball bearings. The wheel base is of such a length as to permit a comfortable four-seated body to be fitted, access to the rear being through a swinging front seat. Altogether the Royal Starling is an interesting addition to the list of moderate price cars.

The Cadogan Cars.

The CADOGAN GARAGE AND MOTOR COMPANY, LTD., of Sydney Street, Chelsea, had an interesting display of three models of the Cadogan cars they have lately put on the market, viz., 14-16-h.p. twin-cylinder, and 16-20-h.p. and 28-32-h.p. four-cylinder, the bore and stroke being respectively 110 mm. by 130 mm., 100 mm. by 100 mm., and 110 mm. by 130 mm. As apart from the engines the general arrangement of the three cars is on similar lines, the following description of the 16-20-h.p. car may be taken as applying to all. The cylinders, as will be seen from Fig. 56, are cast in pairs, with the valves all mechanically actuated off a single cam shaft. Two systems of high tension ignition are provided—Simms-Bosch magneto and coil and accumulators—a separate set of plugs being provided for each. The water circulation is maintained by a pump driven by friction off the flywheel and a honeycomb radiator with fan. The carburettor is of a special automatic type, the hand lever which operates the throttle at the same time varying the amount of petrol allowed to pass through the jet and also the quantity of additional

Fig. 56.—View of Inlet Side of Cadogan 16-20-h.p. Engine.

air admitted. A novel feature is found in utilising one of the engine supporting arms as the air inlet to the carburettor. It may be added that the clutch pedal is so connected with the throttle that as the clutch is withdrawn the speed of the engine is automatically cut down. The cylinders are, we noted, provided with a gun finish, which we are informed is a standard practice in the Cadogan cars. A feature of

the leather-faced cone clutch is that the metal portion of the male part consists of a steel stamping in which slits are made to cause it to spring slightly, and so permit of a progressive engagement. A jointed shaft connects the clutch with the ball-bearing gear-box, which is adapted to give three speeds and a reverse, with direct drive on the top speed through the cardan shaft and bevel gear to the rear live axle, which latter (Fig. 55) has only the driving strain to withstand, the road wheels running on the axle casing. The frame of the 14-h.p. two-cylinder car is of special design, being dropped in the centre to give a low side entrance to the carriage and raised at the rear to give clearance for the differential casing. The back springs, too, of this vehicle are of the double elliptic variety. Taken altogether, the Cadogan vehicles appear to be built on sound lines, and should prove quiet and speedy as well as reliable cars. Needless to say, the chassis can be fitted with any desired type of body, a noticeable one at the show being a 28-32-h.p. landaulet.

The Spyker Cars.

Prominent on the stand of Messrs. SPYKER BROS., whose head British agents are the British Automobile Commercial Syndicate, was a chassis of the latest type of 30-42-h.p. Spyker car, in which an effort has been made not only to render it free from dust-raising proclivities, but also of making it smokeless by preventing any chance of over-lubrication. The engine comprises four cylinders, 130 mm. bore by 130 mm. stroke, cast in two pairs, with the valves arranged on opposite sides. Large inspection doors are fitted to the base chamber. The circular honeycomb radiator is provided with an air-inducing fan mounted on a vertical pillar, fixed or screwed into the crank chamber; around the pillar is fitted a spring, which keeps the belt tight enough to drive the fan, and so does away with the

Fig. 57.—The New Spyker 10-15-h.p. Cab Chassis.

necessity of tightening the belt. To facilitate the starting of the engine a half compression lever is fitted in front of the radiator. The lubrication of the motor is effected by means of a cog wheel pump which draws the oil from a well formed at one end of the crank chamber and sprays it on the moving parts of the engine. Two systems of high tension ignition are provided—magneto and accumulators; the carburettor, which is of the automatic type, has been improved by the addition of a hand-controlled air inlet. The speed of the engine is controlled both by hand and foot levers. The clutch is of the leather-faced cone type, of large diameter. The gear-box is of new design, and gives three speeds forward and one reverse, operated by a lever working in a "gate." A feature of the gear-box is the large and instantaneously detachable cover with which it is fitted. The transmission is to a well-supported live axle through a cardan shaft and bevel gear; the weight of the car is carried on the axle-casing, the live shafts within having only the driving strain to withstand, and transmitting the power to the hubs of the rear road wheels through the squared ends. A foot-brake is now also fitted in front as well as just behind the gear-box. These brakes are independent of one another, and both are operated by the same type of screw-nut mechanism that was formerly used for the single brake. Ball bearings are used throughout, including the engine crank shaft, and the usual four longitudinal springs are supplemented by a transverse one at the rear. Other Spyker cars on view included a 10-15-h.p. side entrance double phaeton, a landaulet of similar power, a 15-20-h.p. chassis, and a useful 20-h.p. delivery van for loads up to 20 cwt. The principal novelty at the Spyker stand was, however, the chassis of the new 10-15-h.p. cab built to pass the requirements of the Scotland Yard authorities, and to which reference was made in a recent issue of the *M.C.J.* We give a view of the vehicle in Fig. 57, and may say that all the well-known Spyker features are retained in this model, the main new departure being the casting of all the four cylinders of the engine in one piece. The bore and stroke is respectively 90 mm. by 90 mm. The gear-box, with gears of the sliding type, provides for three speeds forward and one reverse, which are all operated by one lever working in a "gate."

The "Horse Shoe" Cars.

Among the exhibits of moderate price cars were the "Horse Shoe," shown by the STRAND MOTOR COMPANY, LTD. The vehicles, which are of French construction, can be readily recognised, the radiator casing having been made in the shape of a horseshoe. Two models were shown, 8-h.p. two-seater and 12-h.p. side entrance double phaeton. The smaller vehicle is fitted with an 8-h.p. single-cylinder engine, $4\frac{1}{2}$ in. bore by $4\frac{1}{2}$ in. stroke, having a mechanically-operated inlet valve, coil ignition, and Longuemare carburettor. The speed of the engine is controlled by means of a variable lift to the inlet valves. The transmission is through a leather-faced cone clutch, three speed and reverse gear-box, cardan shaft and bevel gear to a live axle, which on the top speed is driven direct. Springs are inserted between the cone and the leather of the

Fig. 58.—The 12-h.p. "Horse Shoe" Car.

clutch with the object of insuring smooth and gradual contact of the cone with the internal face of the flywheel. The 12-h.p. car (Fig. 58) is also of the live axle variety; the engine comprises two separate cylinders, 4 in. bore by $4\frac{1}{2}$ in. stroke; in other respects the details are the same as in the 8-h.p. vehicle.

The Orion Vehicle.

Messrs. MOSS AND WOODD, of Cricklewood, exhibited two of the well-known Orion motor-lorries, practically identical as to the chassis, one, however, being intended for loads up to three tons, and the other for four tons. These chassis are made by the Orion Gesellschaft, of Zurich, and the 20-22-h.p. engine is of the horizontal opposed type, with two cylinders, 160 mm. diameter by 180 mm. stroke. A change has been made in the inlet valves since last year, the suction type having been adopted in place of those mechanically operated. The whole of the engine is under the body, allowing a large platform area to be utilised for the transport of goods. The carburettor is at the extreme front of the chassis, with gravity feed from a tank which forms the dashboard. The ignition is by high-tension magneto. The cylinders are arranged fore and aft, with the crank-shaft parallel to the axle; a leather-faced cone clutch in the flywheel transmits the power through a Renold silent chain to the gear-box. The gear provides four forward

which time it has covered no less than 57,200 miles. The various parts of the engine and gear had been dismantled to show their excellent condition after such a lengthy service.

The "Little Wonder" Car.

Messrs. SHIPPEY BROS., of King Street, London, E.C., had taken space for a new two-seated car of American construction known as the "Little Wonder," but, unfortunately, it did not arrive in time. As, however, several of the vehicles are now available and can be inspected by application to Messrs. Shippey, we give an illustration of the same in Fig. 59. The motive power is supplied by an 8-h.p. single-cylinder

Fig. 59.—The "Little Wonder" 8-h.p. Car.

horizontal engine of the two-cycle type, with accumulator ignition and water circulation by pump. The change-speed gear is of the epicyclic or planetary type, giving two speeds forward and a reverse, the final drive being by a single chain to a rear live axle. The vehicle is being supplied in several styles at moderate prices, and, with a hood, forms a neat car for doctors' use. Messrs. Shippey also exhibited a range of motor-car accessories, including the Paragon compound "Safety" tyre pump, which is provided with a double barrel and a safety device by means of which the tyres cannot be inflated to a greater pressure than that previously determined. Samples of the new 300 and 600 ampere-hours Gordon battery generators, specially designed for recharging four and six-volt accumulators, were also on view, as well as a pair of Smith-Parfrey's artillery wood wheels, fitted with Clincher rims and Swinchart "Concave" solid tyres, and sections of tyres suitable for heavy char-a-bancs.

Gnome and Mira Cars.

GNOME, LTD., were present with a 10-12-h.p. Gnome car, which appears to combine simplicity of design with sound construction. The vehicle has a pressed steel frame and a four-cylinder engine with

Fig. 60.—Elevation of Chassis of Orion Motor Lorry.

speeds, operated by a hand-lever at the side of the driver, and the reverse is applied by a pedal, when the forward gears are out. The final drive is by roller chains to sprockets on the rear road wheels. A tubular radiator is fitted under the centre of the body, and the water is circulated by a centrifugal pump, gear driven off the crank shaft. The driver is given separate control of the ignition, air and throttle, and the engine can be slowed down to run at a remarkably low speed. The steering is by rack and pinion, and the road wheels are of the artillery type, and are fitted with Polack solid rubber tyres. On a separate stand Messrs. Moss and Woodd had on view an Orion thirty-four seated double-deck omnibus belonging to the Victoria Omnibus Company, Ltd., which has been in service since August 23rd, 1905, at

mechanically-actuated valves. The transmission is through a leather-faced cone clutch to a gear-box giving respectively three forward speeds in addition to the reverse, with direct drive on top speed. Thence the power is conveyed by a cardan shaft and bevel gear to a live axle, squares on the end of the latter driving the rear road wheels. At this stand Milano Motors, Ltd., of Gloucester Road, South Kensington, W., also exhibited a moderate-priced French built car, known as the Mira. The engine, which is of 15-h.p., comprises four cylinders, having the suction type of inlet valves and two forms of high-tension ignition—magneto and accumulators. The transmission is by a cardan shaft and bevel gear to a live axle, the gear-box giving three speeds forward and a reverse with direct drive on the top.

The Churchill Vehicles.

One of the attractions of the show was the huge motor char-a-banc exhibited by Messrs. DURHAM, CHURCHILL AND Co., of Sheffield. The vehicle (Fig. 61) is intended for public service work, and represents a type of which the firm are now making a speciality, and of which a large number are in operation in various parts of the country. It has seating accommodation for twenty-six passengers, the rows of seats being arranged gallery fashion, so that everyone can have a clear view ahead. The motive power is supplied by a 24-30-h.p. Aster four-

Fig. 61.—Elevation and Plan of Churchill Char-a-banc.

cylinder engine with two systems of ignition—high tension magneto and coil and accumulator. The transmission gear consists of a "Champion" friction clutch having metal-to-metal surfaces and a patent change-speed gear. From the gear-box, the shafts of which run on ball bearings, $\frac{3}{4}$ in. balls being used, the power is conveyed by a universally jointed shaft to a differential countershaft, the latter carrying chain pinions which convey the power to sprockets fitted to the hubs and spokes of the rear road wheels by means of roller chains which run in a gear case. The "Champion" gear referred to above is an entirely novel mechanism, giving four speeds and reverse, all changes being obtained by means of one lever. This gear is so constructed that the teeth of all the wheels are always in mesh and it is practically an impossibility for an inefficient or careless driver to damage the wheels in changing from one speed to another, a much-desired feature in the change-speed gear of any public service or commercial vehicle, where absence of repairs means increased earning power. The chain sprockets have very long bosses, which are bushed with phosphor bronze sleeves so arranged as to form oil reservoirs. The steering gear is of considerable strength, and special attention has been paid to the brake power, there being three different sets—a 4 in. wide contracting brake on the differential shaft, internally expanding brakes, 18 in. diameter, working in drums attached to the rear wheel hubs, and emergency shoe-brakes on the back wheel tyres. A special feature of the char-a-banc is the seats, which are made in accordance with Lee's patent, for which Messrs. Durham, Churchill and Co. are the sole licensees. The framing of these seats is rigid, but every passenger enjoys a separate hammock seat, which gives perfect freedom from vibration and road shock, while the back rest is carried by spring steel rods, the whole forming a most restful seat, which goes a long way towards the enjoyment of a long motor coach tour. A 20-h.p. delivery-van for loads up to 2½ tons; this is built on similar lines to the char-a-banc above described. A careful inspection of these "Churchill" vehicles shows that the firm have spared no pains to produce a machine which shall be fully capable of withstanding the difficult work they are called upon to perform. The question of accessibility has not been overlooked, while, as showing the attention paid to the details, we may mention that even the spring shackles are provided with oil holes—a small point in itself, but one which is frequently overlooked. On a separate stand Messrs. Durham, Churchill and Co. also exhibited one of their 12-14-h.p. Hallamshire cars fitted with an Aster engine of the latest type, and with a side-entrance double phaeton body. The clutch is of the champion metal-to-metal type, and three forward speeds and a reverse, with a direct drive on top speed, are available, the power being transmitted through a cardan shaft and bevel gear to a live axle. The latter has only the driving effort to withstand, the weight of the car being taken by the sleeve, the power being transmitted to the road wheels through dog clutches in the hubs. Examples of the Churchill steering and change-speed gears for cars and reversing gears for motor-boats were also on view.

The Halley Commercial Motor Vehicles.

HALLEY'S INDUSTRIAL MOTORS, LTD., of Yoker, Glasgow, confined their exhibit to the chassis of a 20-h.p. vehicle, suitable for us

as a delivery van or lorry for loads of from 30 cwt. to 2 tons. The engine is of the twin-cylinder vertical type, 5 in. bore by $5\frac{1}{2}$ in. stroke, the normal speed being 850 revs. per minute. The valves are all mechanically-operated and are arranged on opposite sides. A governor is provided, this acting automatically on the throttle, which can also be controlled by hand ignition or by low-tension magneto. The lubrication of the engine is effected by a pump, while a feature of the radiator, which is of the framed ribbed-tube type, is that it is hinged, and can be lifted clear of the engine to give free access to all parts of the latter for the purpose. The power is transmitted through a leather-faced clutch and a long universally-jointed shaft to the gear-box, which is adapted to give three speeds forward and a reverse, the various pinions being always in mesh. The different speeds are controlled by a lever working in a "gate"; a safety stop being provided to prevent the reverse being engaged by mistake. From the differential shaft the power is transmitted to the rear road wheels by side chains. The Halley vehicles appear to be well suited for the hard work they are intended to perform; the dimensions of the various working parts are liberal, and we notice that the crank chamber and gear-box are made of gun metal in place of the usual aluminium.

The Porthos Car.

A vehicle which attracted considerable attention was the 24-30-h.p. Porthos car (Fig. 62), exhibited by Messrs. COLIN DEFRIES, LTD., on the stand of Messrs. Windover. The frame, which is of pressed steel, narrowed at the front to increase the lock of the steering wheels, is supported both at the front and rear on three-quarter elliptic springs. The engine comprises four separate cylinders, 110 mm. bore by 130 mm. stroke, with the valves arranged on opposite sides. The ignition is by high-tension magneto, while the carburettor is of a special automatic type, the extra air valve being opened by means of a leather diaphragm, on which the suction of the engine acts. Another feature of the carburettor is that the vaporising and mixing-chambers are separate; the petrol is supplied by pressure to a small reservoir on the dashboard, which contains an ordinary float chamber through which the petrol must pass before reaching the carburettor, thus preventing pressure in the latter. A tap is fitted for shutting off the flow of spirit, and at the same time the pressure. The lubrication of the engine is effected by a small pump built in connection with and operated by one of the exhaust valve tappets. The transmission is through a leather-faced cone clutch, four speeds and reverse gear-box, with direct drive on top, cardan shaft and bevel gear to a live axle. The latter forms a somewhat novel departure from the ordinary practice, the usual design being practically reversed—that is to say, the power is transmitted to the road wheels through hollow sleeves, which, instead of being fixed as usual, rotate in ball bearings. The weight of the car is carried by a solid shaft which extends in one continuous piece from wheel to wheel, and which also rotates with the wheels. The

Fig. 62.—Chassis of Porthos 24-30-h.p. Car.

differential is of the parallel-pinion type, and the intermediate pinions have been made much longer than usual, so that the driving gear is, to a certain degree, free to move laterally on the driving sleeves and so adjust itself to any strains which might otherwise tend to disturb the correct meshing of the bevel gears. This "floating" action is facilitated by the absence of torque rods, the natural tendency to turn being resisted by the casing provided around the cardan shaft. From the foregoing it will be seen that the Porthos cars, which are of French construction, comprise a number of special points, the behaviour of which, in practice, will be watched with interest.

MISCELLANEOUS EXHIBITS.

Sawyer Non-skid Bands.

The Motor Stores was showing the well-known "Sawyer" bands; the inventor, however, is still identified with his non-skid. These devices are made in three styles: (a) leather vulcanised band; (b) leather detachable band; (c) "combination" leather and rubber vulcanised band. The first of these is a chrome leather outer cover, vulcanised over the outside of any pneumatic tyre, which is completely enveloped, thus being afforded complete protection. The suppleness and strength of the leather combine to give the band durability and also enable it to withstand any sudden violent strains to which motor-car tyres are constantly subjected. The detachable band is of the same character as the vulcanised type, but can be taken on or off when desired with ease. The tread of the band is fitted with clips, so that it can be easily attached. Firstly, the tyre should be deflated, and the clips then inserted under the wheel rim. The re-inflation of the tyre will do the rest. In the Sawyer "combination" leather and rubber vulcanised band we have, as the name implies, a band in which leather and rubber are both employed. The tread which has to encounter the road surface is of stout chrome leather, and carries the hardened steel studs. This is attached to a heavy rubber crescent-shaped band, beneath which an intermediate band of leather is provided to which the shanks or rivets are attached. The chafing of the tyre by these is prevented by another leather band being vulcanised on the rubber tyre. The Sawyer non-skid bands are maintaining their reputation despite competition.

The Coventry Simplex Petrol Motors.

THE COVENTRY SIMPLEX MOTORS, LTD., a new comer to the Show, had an interesting display in the Gallery of the four and six-cylinder petrol engines they have lately introduced. As we gave an illustrated description in a recent issue of the *M.C.J.*, we need only mention that two sizes are made, 16-h.p. four-cylinder, and 25-h.p. six-cylinder, the bore and stroke of both being 3½ in. by 3½ in. Special care has been taken in the selection of the material for the various parts, the crank-shaft being made from a solid steel forging, while, in addition to it running on ball-bearings, a separate compound ball thrust bearing is provided. A special form of automatic carburettor is being supplied for use in these motors, the extra air-valve being provided with a dashpot. The jet and other parts of the device, too, are so fitted that they can be readily taken apart for cleaning purposes.

The Cave Tyre and Non-Skid.

Among those particularly interested in tyres, the new type shown by the CAVE PNEUMATIC TYRE PATENTS was of considerable interest in the fact that, dispensing with rubber in the outer cover, it suggests an economy in the running of automobiles which naturally appeals to all owners of cars. The tyre is made of a fabric and is formed of layers of material which is rot-proof. It has a wired edge and locks into the rim, being maintained in position without the use of security bolts. Although the cover has no rubber, it is remarkably resilient and should prove durable in use. The Cave removable non-skid tread was another novelty at this stand. This consists of a row of studs embedded in leather or rubber, and placed on each side of the tread, so that the non-skid only comes into use when actually wanted. The "Nolevah" section rim was also on view. It is adjustable to any wheel and is suitable for all descriptions of tyres. A section of the rim is removable practically instantaneously, and the tyre can then be taken off without the assistance of a lever in a few minutes—a saving of labour and time that will be appreciated when motoring.

"Necessaries."

Under such a designation Messrs. F. S. NICKELLS AND CO. showed several useful novelties for motorists of all degrees, including patent electrical nuts and fasteners, universal valve connectors, the Eclair connector and combined tyre meter, a patent tell-tale lamp, &c. The ingenious valve connector was favourably commented upon in the *M.C.J.* in October last, and mention may now be made of the firm's connector and combined tyre meter, a very simple and satisfactory device. With the system adopted by Messrs. Nickells and Co. all likelihood of shock to the gauge is avoided, while at the same time there is a free passage to the gauge from the inner tube. The tell-tale lamp on the stand was another notable exhibit, being both dust and soot proof. In this there is a slightly concave plate in the dome of the lamp, the concavity in which is increased by the heat from the flame, thus breaking contact with an insulated set screw in the dome. Upon the lamp going out contact is made and warning is given to the driver by a small glow-lamp fixed in any convenient position in the front, and worked from the accumulator in use. If preferred, an electric bell can be fitted under the seat, and also worked from a dry cell. By the aid of Messrs. Nickells and Co.'s patent terminals the device is instantly detached for lighting in windy weather.

Mobiloids.

THE VACUUM OIL COMPANY, LTD., has become a familiar name to motorists by reason of the Vacuum mobiloids for water and air cooled engines, gears, &c., for motor-cars as well as chain lubricants and oils for all types of commercial vehicles. Vacuum A mobiloid is for cylinder and crank case lubrication; Vacuum C mobiloid is a high-grade oil for gears perfectly free from foreign matter, and with no tendency to corrode or "gum up," the oil leads to the bearings. Special oils were also shown as prepared for steam and electric cars, while the Vacuum graphite

grease and the Vacuum mobilubricant are of recognised merit. The latter is for use in pressure cups for all purposes where grease or solidified oil is required. A speciality of the VACUUM OIL COMPANY is an oil for leather-lined clutches which will keep the leather pliable and protect it from the hardening influence of moisture as well as prevent both "slipping" and "fierceness."

Parsons' Non-Skids.

THE PARSONS NON-SKID COMPANY had a good representation of their Grippa non-skids, sparklet inflators and other specialities. The "Parsons Grippa" detachable non-skid is a very efficient and convenient device, and has the further advantage of economy in cost. The Parsons Non-Skid with wire side hoops and zig-zag cross chains was one of the earliest attempts to preserve motorists from the serious dangers of side-slip. The principal feature of the new type is the substitution of chain for wire in the side hoops. After careful experiment it has been found that the chain can be relied upon for strength. Indeed, it has the advantage over wire in this respect, as it is not affected and weakened by rust. The adoption of chain hoops has made the non-skids much easier to attach. It has also overcome a difficulty with regard to fitting, as it is easy to shorten the chains should the Non-Skid be too large, and the company are purposely sending them out when new with the hoop chains a little too long, to meet the case of re-treaded or extra size tyres. With the chain hoops the non-skids collapse into a much smaller space, and can be carried in the car in a small canvas bag, which can be conveniently stowed in the tool box or under the seat.

Clothing.

MESSRS. CHARLES BAKER AND COMPANY'S STORES, LTD., have come well to the front in connection with motor clothing for ladies and gentlemen, and their selection of raiment for summer and winter motoring was conspicuously complete and stylish. A glance at the articles disposed on their stand gave evidence of the great advance that

Fig. 63.—Baker and Co's Motor Coats for Ladies.

this department of motoring has made in recent years, and in overcoats, ulsters, waterproofs, and similar garments for both ladies and gentlemen, the firm have paid regard to appearance as well as utility. Their selection of gloves, aprons, caps, rugs, leggings, puttees, &c., was as extensive as their range of tailoring materials, and their presence at the exhibition will doubtless result in their further recognition as tailors conversant with the needs of motoring as well as familiar with the arts of the cutter.

The Beresford Rim.

Since its introduction at the last Stanley Show, the Beresford Patent Motor Rim has made considerable advance in public favour. This motor rim overcomes many of the disadvantages which attend the satisfactory attachment and detachment of tyres, saving labour and time. It has no complicated mechanical details, so that it is not only free from liability to get out of order but is able to be manufactured at a price which cannot fail to prove a factor in its adoption. The detachable flange is sprung over the rim in such a way that the inflation of the tyre locks it into the outer edge or flange of the rim itself. To get at the tube all that is necessary to do is to deflate the tyre, spring the flange over the rim, and slide the tube and cover off, reversing the operation to replace. This is the work of a few seconds, and, requiring no great muscular effort, constitutes one of the great claims made by the BERESFORD RIM COMPANY, LTD., who are introducing the device.

Flooring for Garages.

THE CORK ASPHALT, LTD., had some specimens of their pavement on view. This pavement has the quality of non-absorption, and evidence of its value on this account can be furnished in the courtyards of many of the royal palaces as well as at several important railway stations. It is a compound of bitumen and other materials, including cork; and being durable, elastic and non-absorbent to moisture, is hygienic and sanitary in use. It is of a non-slippery nature, so that the necessity of sprinkling the surface with sand is obviated—a decided advantage in the case of motor garages and similar establishments.

The Windham Detachable Bodies.

The WINDHAM SLIDING DETACHABLE MOTOR BODY COMPANY, of Clapham Junction, S.W., had on view several examples of their detachable and interchangeable bodies as built for Daimler, Renault and Star, and, in fact, for any modern type of car. Apart from the advantage of the detachable body in giving access to the differential shaft of chain-driven cars and to the live axle of gear-driven vehicles, and the brake mechanism of both, its main feature is, of course, the facility it affords of converting a car to different purposes. Thus, with one chassis a motorist may have on hand a side entrance double phaeton, landaulet for town use, or shooting brake body, any one of which can be placed in position in less than a minute, or a luggage-carrier can be fitted converting the vehicle into a two-seated touring car. Again, for tradesmen's use, the pleasure body, either closed or open, may be readily replaced by a delivery van, the spare bodies all being stored on their own legs, the height of which is so adjusted that the lower edges of the bodies are on a level with the sitch-plate guides on the chassis. It may be remembered that we gave an illustrated notice of the system in the *M.C.J.* of November 18th, 1905; as, however, since that time various improvements have been effected on it, the following description may be of interest:—Briefly, the system consists in fitting to the side members of the frame of the chassis a small and light steel sitch plate. When in position this forms an L-shaped guide, the vertical and horizontal surfaces of which measure only about an inch. The lower edges of the sides of the body, which are provided with a long brass strip, are made of corresponding shape, so that the latter may slide into position from the rear. The guide plate is at intervals slightly countersunk, to receive rollers, which facilitate the sliding action of the body. The fit is so accurate that it is impossible to detect that the body is of the detachable type; the extreme forward portion of the bottom part of the body is cut aslant, and abuts closely to the rear ends of the woodwork of the front seats. When quite "home" the body automatically locks

Fig. 64.—A Limousine and a Side-Entrance Body, both made detachable on the Windham system, for a Renault Car.

itself in place by means of two special catches, in such a way that there is no danger of its becoming accidentally detached. To ensure additional rigidity of the body, and to prevent any tendency to rattle, the rear ends of the guide plates are formed with V grooves in which fit corresponding projections on the rear of the body in such a way that their existence is hardly noticeable. Another recent improvement is a safety catch in connection with the side doors, which prevents the body being slid back unless these are locked, so that there is consequently now no danger of the varnish of the door panel or the mudguards being inadvertently damaged. Another important factor of the Windham system is the provision of wooden legs with rubber-tyred castor wheels; these are intended to be kept in the garage, but can, if desired, be so arranged that, as the body is drawn from the chassis along the guides, the rear pair of legs shall fall automatically into position, thus enabling the body to be withdrawn by one man, and without the use of any lifting tackle. The forward pair of legs can be fixed in place ere the body is entirely clear of the chassis, after which it may be wheeled away to its place of storage. The illustration given herewith (Fig. 64) depicts a Renault car which has recently been provided with two detachable bodies on the Windham system. While it is impossible to detect where the rear part is joined up with the forward fixed section, by simply opening the tool chest at the rear and lifting the safety catches it is possible to pull the detachable portion to the end of the guides in a few seconds, this without the use of any tools. Altogether the Windham arrangement is a step forward in motor-body construction, and one that has already met with recognition at the hands of carriage builders, it having been adopted amongst others by such well-known firms as Messrs. Holmes, Mulliner, Alford and Alder and Holland and Holland. We may add that it is applicable to all sizes and types of chassis, and that existing bodies can be adapted to the sliding detachable principle.

Motors.

Mr. F. C. BLAKE occupied a stand with his 6-h.p. double-cylinder marine motor set, 25-h.p. four-cylinder marine motor sets, and other well-designed exhibits of special interest to those concerned with the development of the motor-boat. One of his specialities is a 12-h.p. four-cylinder engine designed for use in launches up to 35 ft. The cylinders are cast in pairs with water jackets in one piece, eliminating head joints. This motor is fitted with high tension electrical ignition, Blake's patent high speed trembler coil and distributor and Longuemare carburettor. All the parts are automatically lubricated by splash lubrication and the doors fitted to the crank chamber are commendably large.

Cape Cart Hoods.

MESSRS. S. SWAN AND CO. had a good display of cars and accessories, the latter including Cape cart hoods, wind screens, lubricators, &c. Special attention may be drawn to the firm's Cape cart hoods and glass screens made in their own factory and possessing many points of distinction. A special type of fitting was that arranged for side-entrance cars made with brass fittings complete with the side and back curtains. There is a mica window at the back. The necessary straps and irons for fitting are supplied, making the whole device a very complete addition to the car. Folding glass screens in walnut and mahogany were also on view. Tyres, valves, electric buzzers, accumulators, horns, lamps, axles, &c., were included in the comprehensive exhibit of Messrs. Swan and Co.

The O.S. Speed Indicator.

Mr. W. S. SEARLE limited his exhibit to a couple of really notable specialities, one being the Schulze manograph, which is coming largely into service in British as well as foreign motor-car works, the other the O. S. speedometer, a reliable and durable instrument that is attracting considerable attention. This is simple in construction and accurate and reliable, and won the first prize in the trials of the French Automobile Club last year. Accuracy is gained by the use of the magnet system, the magnet turning in a closed circuit to give an immediate indication and prevent demagnetising. The system of transmission in the O. S. speedometer is a departure from the ordinary method, and all the working parts are hidden under the body of the car. We propose to describe the ingenious apparatus in an early issue.

The Validus Non-Skid.

An effective display was made by the "VALIDUS" NON-SKID MOTOR TYRE COMPANY, whose specialities have been well thought out before being placed on the market. Among the exhibits we noticed a new feature in retreading, viz., the Validus rubber retread, canvas studded. This is particularly designed for front wheels and secures a much firmer grip on the road than does the ordinary rubber retread, and acts practically as a non-skid. The Validus rubber combination non-skid is composed of a rubber and canvas band with a leather studded tread on the surface. The speciality of the company is fitted with a renewable tread—a point in favour of the economy of the device which should not be overlooked.

Cort's Non-Skid.

The detachable non-skid motor tyre band introduced by Mr. W. S. CORT, of Market Harborough, has been successful in preventing skidding, while, at the same time, preserving the tyre from punctures. Should it ever become loose on the tyre it can be quickly tightened by a nut specially provided for the purpose. In attaching or detaching no screwing is required, as the band is fitted with clips which fit into the rim. In the case of tyres without bead, the clips are made to fit round the spoke, so that provision is made for the adoption of Mr. Cort's non-skid on any type of tyre.

The Vulcan Specialities.

MESSRS. GEIPEL AND LANGE drew special attention to their speed indicators and odometers known as the Vulcan. The former are simple in construction and reliable in operation. They are electrically-operated, the apparatus consisting of a small magneto dynamo driven from the car's front wheel, connected to a dial which is actually a voltmeter, the needle of which follows the variations in current generated by the magneto in proportion to the varying speeds of the road wheel. An entirely new feature is introduced this year in fitting a phosphorescent dial, which allows of the indicator being read at night time. The dial is extremely luminous and requires but a short exposure to daylight to render its surface active. The Vulcan Odometer is a hub-cap mileage recorder. The odometer is arranged to be fitted to the hub-cap of the "off" front wheel as to become an integral portion of the same. Messrs. Geipel and Lange also had a collection of voltmeters, auto-tremblers, &c., as well as the Vulcan positive-stop lever, which affords a positive stop action for the ordinary type of "straight through" change speed lever. The Vulcan lever ensures that the centre of the gear cannot possibly be passed without a definite looking action. It is impossible for any gear to be passed over without the driver being well aware of the fact and having made a voluntary movement to pass on.

Bent Timber.

MESSRS. BEAVAN, HOGG AND CO. showed a good assortment of their productions in bent timber as supplied for motor-cars, motor-buses, and all descriptions of automobiles. Motor-bus wings and bends, Cape cart hoodsticks, panels for the seats of cars, rails and wings, and, in fact, every description of bent timber for the car, was to be seen on their stand.

Motor Bodies.

Some excellent specimens of modern motor body building work were shown by Messrs. CHARLES S. WINDOVER AND CO., LTD., including a seven-seated limousine. The interior is upholstered in drab cord, has plate glass windows, electric lights, and is fitted with every convenience for the comfort of the most exigent motorist. A neatly designed side-entrance double-phaeton was also shown.

The Prested Battery.

In our issue of February 16th we described and illustrated some of the Prested electrical specialties which attracted interest to the stand of the PRESTED MINERS' LAMP CO., LTD. Among these was the Prested coil fitted with a new patent trembler and cut-out in many types, ranging from that supplied for the 250-h.p. Westinghouse gas engine to the small trembler coil required for a motor-bicycle. The success of the Prested battery has been most marked, and in many competitions it has assisted motorists to distinction. Attention may be drawn to the battery W. T. L., which presents an excellent workman-like appearance. The case is made by special machinery from one solid piece of teak, so that no leaks are possible. By a chemical process the wood is made acid-proof and non-conducting. The plates are seven in number, separated by perforated

Fig. 65.

and corrugated celluloid, making short circuits impossible. After being placed in the cell a composition in a molten state is run along the edges, holding the sections rigidly in their places. The plates and cell consequently form a solid block, which no amount of vibration can possibly affect. The battery is furnished with vents $\frac{3}{4}$ in. in diameter, allowing the plates to be viewed from the top. The Prested Company also showed the neat form of test lamp illustrated in Fig. 65.

T. and M. Accessories.

Messrs. TRIER AND MARTIN, LTD., had some good specimens of high-grade mechanical work on their stand, including the T. and M. lubricator, a tyre-tester, and the T. and M. patent multiple-jet carburettor, which we described and illustrated on page 150 of last week's issue. The lubricator shown on the stand had a smart appearance and works by pressure from the exhaust. Each of the drip tubes are separately removable for cleaning purposes by simply slackening the lock nut and cup, and the filling hole is of a diameter large enough to insure rapid filling with no spilling or waste of oil. In the new tyre tester brought out by Messrs. Trier and Martin, Ltd., the motorist is provided with a ready means of testing his tyres in a minimum of time, and with an instrument both accurate and durable.

"Eclair" Pump Connection.

Mr. H. J. HARDING made a special feature of the "Eclair" instantaneous pump connections for motor-cars and motor-cycles, which have previously been described in the *M.C.J.* This is automatic in action and will fit all types of valves, thus dispensing with the necessity for special adapters. As a simple, durable and airtight connection the "Eclair" has points of advantage which were evidently appreciated by many visitors to the Motor Car Show.

Tyre Repairs.

The DEFIANT NON-SKID AND TYRE ACCESSORIES COMPANY had a selection of their detachable non-skid bands and "Gnaviter" steel studded leather and rubber treads for renewing non-skid covers, as well as a selection of specimens of tyre and tube repairs. The "Gnaviter" tyre gauge was also on view, this being an excellent device, inasmuch as it is impossible to exceed a determined pressure in the tyre. The Defiant Company is specialising on tyre work, and its bands have features of a distinctive character.

The Gare Wheels.

The "Gare" tangent wheels attracted attention to the stand of the TANGENT WHEELS, LTD. The novelty of this system of building the wheel consists in the line of each spoke passing to one side of the axle, or tangentially to it and to the hub. Every spoke is of full width at the nave and at the felloe, the ends being wedge-shaped instead of being made with shoulders or butt ends. Steel plates are employed to strengthen and secure the spoke ends and the several felloe sections. The plan adopted gives strength and assists the resilience of the wheel—two important considerations that will appeal to every motorist of experience. Tangent wheels of the open spoked type can be made of any ordinary size, and for any usual load, and suited for either horse-drawn or motor-propelled vehicles. They can also be made to take any ordinary form of solid or pneumatic rubber tyre.

New Lubricator.

An interesting type of pressure feed lubricator was shown for the first time by Messrs. W. D. FAIR AND CO., of Knightsbridge, S.W., in which some distinctly good points were incorporated. The appearance of the device is not far dissimilar from the ordinary pattern of lubricator. The oil tank has a gauge into which air is pumped, forcing the oil upwards through the sight feeds, which are filled with water to a point within $\frac{1}{2}$ in. of the top. Thence the oil issues through perforated brass discs lifting celluloid discs resting on these and flowing into holes leading into the lubrication pipes, from whence it is communicated to

the working parts. The device is simple and effective, and provided an undoubted attraction to the display of Messrs. W. D. Fair and Co.

The ADVANCE MANUFACTURING COMPANY, LTD., showed a range of 3 to 9-h.p. engines, and also their cycles fitted with these motors. The company have attained a large measure of success in connection with this branch of motorism, and their machines are constructed on thoroughly up-to-date lines and with good workmanship evidenced on their part.

Mr. H. W. SOUTHALL, jun., showed the Gibson Power Indicator, by means of which both the compression and explosion pressures developed in each cylinder under the actual working condition on the road can be ascertained. The Southall tyre gauge was also shown—an accurate and reliable instrument, the good points of which have already been made known to readers of the *M.C.J.*

Messrs. KOSSUTH AND CO., the famous Parisian art printers, gave English visitors some idea of the excellence of their work by the display of a series of coloured posters suitable for drawing attention to motor-cars, &c. Some notion of the excellence of their work has been obtainable on the hoardings of late, the posters of the Cordingley Show having been executed by this firm from the special design of a leading French artist.

The ZENITH MOTOR ENGINEERING COMPANY showed their new Zenith tri-car fitted with a 6-h.p. twin-cylinder J. A. P. engine and Longemare carburettor. This is built on the double frame spring suspension principle, a system of construction which the makers claim to obviate all vibration and risk of side-slip. The new Zenith bi-car, with a 34-h.p. Fafnir engine, is constructed on the same principle, the frame absorbing all vibration before it can be conducted to the lower frame, on which the entire weight of the rider and the engine is carried.

The patent seamless serrated copper, brass, and steel oil cans, petrol squirt cans and other specialties exhibited by Messrs. JOSEPH KAYES AND SONS, LTD., occupied a conspicuous position in the Arcade. The firm also showed their patent forced feed lubricating oil cans as well as their oil economiser for lubricating oils for motor-cars. Strength and durability as well as good features of construction characterise the productions of this firm, which is catering with considerable success for the requirements of motor garages as well as of private owners of motor-vehicles.

A large collection of motor trunks, motor clocks, &c., were shown by Messrs. FINNIGANS, LTD., whose specialties include several trunks adapted for the use of motorists going on tour. We particularly noticed two or three types shaped for fixing on the grid at the rear of vehicles, these being obtainable in colours to match the other parts of the car to which they are attached.

Messrs. DAY AND CO. had a selection of two-cycle motor marine engines ranging in power from 14-h.p. to 25-h.p., as well as a motor-launch built by Messrs. Sommers and Payne of Southampton. This was fitted with a 34-h.p. engine and attracted considerable attention, as did also the working model of the Gies reverse gear. This consists of a gripping device, two machine-cut pinions, and a short drive by a steel sprocket chain.

Motor Accessories.

The FRENCH MOTOR ACCESSORIES CO., LTD., had a comprehensive display of electrical fittings for motor-carriages, these being of excellent design and finish. They also showed the head,

side and rear lamps of Ouvrard and Co., of Paris, for whom they are the agents, and with the Clerget non-skids, Fulmen accumulators, and A.V. plugs, made up a really interesting exhibit. Of these we illustrate (Fig. 66) the A.V. plug, the central electrode of which, for magneto ignition, can be expanded to allow for wear of the external electrode. The plug can be obtained for coil ignition or double ignition by coil and magneto. Among the literature distributed at the stand was a splendid catalogue for the 1907 season, extending to more than seventy foolscap pages, and containing reference to nearly 200 accessories stocked by the French Motor Accessories Co., Ltd.

The specialty of FASTNUT, LTD., has been so frequently referred to in connection with exhibitions that it will now suffice to say that it is a guaranteed device for holding nuts, securing them under any amount of vibration.

The LYXAVON COMPANY had on view their grease removing soap—a preparation of interest to the many motorists who have had difficulty in removing the dirt which seems inseparable from motoring.

Baseley's lubricating oils were shown on the stand of Mr. F. C. BLAKE, in the gallery, and secured much attention from expert visitors.

The Desclee patent non-skid and gaiter, as well as other good types of devices for the prevention of punctures, were shown by Messrs. DESCLEE AND CO.

Plugs and igniters were conspicuous on the stand of Messrs. LEO RIPAUT AND CO., which was occupied by a selection of high-class accessories, &c. These included accumulators, synchronised coils, non-skid bands, &c., and the various specialties of La Societe Oleo, for which the firm are the British agents.

(To be concluded.)

CORRESPONDENCE

[Letters to the Editor should be addressed to the office,
87-88, Charing Cross Road, W.C.]

SIX CYLINDERS v. FOUR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The subject of six v. four cylinders is sufficiently important as a technical measure of engine capability to invite examination. The points at issue appear to arrange themselves in the following order, namely, first cost, efficiency, comfort, and flexibility. In the first case, the question is not so much a comparison of existing cars, in which six or four cylinders are involved, as it is whether the cost of the one is greater than the other. As engines, power for power, it is undoubtedly impossible to make a six-cylinder engine as cheaply as a four-cylinder, because, with a correct design, the weight of four cylinders will be less than the weight of six smaller ones of the same power and stroke, and all engineers will recognise this as an ordinary condition, that the incidental machining of six small cylinders will take a longer time than the machining of four a little larger. The difference in the machining speed rates would be very little, but the setting and handling of six cylinders would take just about one-third more time than for the four.

Six sets of valves and the necessary gearing would cost more than four sets for the four cylinders. The weights and different quantities of surface to be machined are practically negligible; therefore the cost

The Double Landulet recently supplied by the New Engine Company to the Marquis of Ripon.

Attention may be drawn to the great depth of the front seats, together with the excellent accommodation for four passengers in the back part of the body. Despite this, and although the wheel base is only 10 ft. 2½ in., the back seat is still well in front of the back axle. It will be seen, too, that side doors have been fitted to the forward portion of the vehicle, adequately protecting the feet of the passengers on the front seats.

again is one-third more for the six. The crank shaft for the six-cylinder would be of lighter section, but longer; and six cranks would take longer to machine than four. Therefore, again, the 6-throw crank would be roughly one-third dearer than for four. Six complete sets of connecting rods, brasses, bolts, &c., would again represent about one-third more cost, because the difference in the weight of the material may be nearly equal, but the cost of machining and fitting is six times in one case to four of the other. Six complete sets of pipe fittings and connections will cost a great deal more than four sets. Extra length of crank case is a necessary condition, meaning extra expense, in spite of the fact that a little weight might be saved sectionally, because of the more equal distribution of the power effect.

As a general conditional workshop measure a six-cylinder engine, power for power, is likely to cost at least 25 per cent. more than a four-cylinder. The flywheel is purposely left out for further reference, and it may be presumed that the difference in size and weight of chassis need not vary much for the two different engine conditions, because, however the power may be distributed at the crank shaft, the fact remains that each revolution, presuming the same strokes to be equal, carries the same amount of power to the driving wheels. It is assumed that in a correct design the speed of revolution of the six and four-cylinder engines are alike. Therefore, the function of the flywheel is an attempt to equilibrate inaccurate movement and unequal forces by storing surplus energy at one period and giving it out at another, and it is obvious that, where the spaces are divided on the flywheel into six parts for the six-cylinder and four parts for the four-cylinder, the weight of the rim in one case can be lighter than that of the other, because there is less surplus energy to store between the intervals. Whatever opinions exist in regard to flywheel weight, it is nevertheless a fact that weight of flywheel represents in some way something more than mere weight or mass resistance

measured at the rim, and this Mr. Dunlop appears to appreciate. Now, it is quite evident that the nearer the impulses are together there must be less variation of speed, and, consequently, smoother running, even for equal powers.

What may be termed the unbalanced thrust of the six-cylinder engine must be less in proportion to the overlap of the six-crank action. Now, the total thrust horizontally of both the six and four-cylinder are equal as to magnitude, but less as to detail. Therefore, the tipping moment of the six-cylinder must be less than that of the four, because the forces are applied six times in one case and four in the other. The advantage for the six-cylinder, in regard to this influence, is, therefore, as 2 is to 3, but there is an overlap in the six-cylinder, which is a part balance for the opposite thrust. Thereby the tilting moment is still further reduced.

The flywheel action and effect is to lift the wheels off the ground on one side, and to push the frame over on the other, the general tendency being to tilt the car to the side to which the top of the wheel is running. It is an obvious conclusion that the heavier the rim the greater the tilting effort, which is proportional to the weight. Now, a flywheel for a six-cylinder engine, diameter and speed being alike, need only have two-thirds of the weight of the rim of the four-cylinder wheel. This may represent 30lb. to 40lb. weight of metal, and the centrifugal force is in proportion. There seems a self-evident fact that the non-necessity of keeping up this centrifugal force gives greater freedom to engine revolution, because there is a less actual resistance, and under a less resistance the speed of the engine can be correspondingly reduced. Efficiency should, therefore, be augmented, unless other conditions intervene to prevent it, such as the increased surface area of cylinder exposed to the same quantity of hot gas, but this does not alter the fact that a lower turning moment means the possibility for a lower speed.

Generally, the above observations include comfort and flexibility, and apparently these receive a decided advantage from the use of six cylinders as against four, whilst the question of efficiency may be equal for both in regard to heat, but in regard to mechanical efficiency it would seem that the six-cylinder is again advantageous. How much these advantages count against first cost, upkeep, and more parts to look after, besides six instead of four sparking periods, are matters users and owners have to decide.

Very many things occur in actual work which are more or less incidental to human care on the one hand or lax inattention on the other, but the previous deductions are, more or less, purely conditional to engineering principles. Frictional resistances present doubtful issues, meaning that increase of surface sometimes means increased loss, whereas increase of surface for equal pressures may mean reduced aggregate resistance, and, looking at the conditions from a practical standpoint, the frictional resistance for six and four cylinders for equal power seems to be a case of six of one and half a dozen of the other.—Yours truly,

JOHN BATEY.

THE SCOTTISH RELIABILITY TRIALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been looking through the rules governing the Scottish Automobile Club's Reliability Trials and the Frome's Hill Climb. The standpoint from which I have been considering them is that of the Ford Junior Car, which is a four-cylinder, two-seated car. The bore of the engine is 3½ in. and the stroke 3½ in. Rule No. 7 of the Scottish Automobile Club's regulations provides as follows:—"Any car showing more than 15-h.p. on the basis of the following formula shall have a seating capacity of not less than four:—

Cylinder diameter in inches $2 \times$ number of cylinders.

25

This formula, as you will observe, takes no account of the stroke of the piston, therefore a car fitted with an engine having a short stroke and comparatively wide bore is unfairly handicapped. For engineering purposes, the utility of which is thoroughly acknowledged by all competent designers, the stroke of the Ford engine is less than the bore of the cylinder, therefore, although we only rate the engine of the vehicle at 15-h.p. according to the above-mentioned formula, it works out as follows:—

$$\frac{15}{4} \times \frac{15}{4} \times 4 \times \frac{2}{5} = 22\frac{1}{2} \text{ h.p.}$$

The Scottish Club hold their trials presumably that the public may ascertain what is the most reliable car in each class, the class being ascertained upon a basis of price, but they consider it necessary to stipulate that when cylinder capacity exceeds their given formula the car must carry four persons, irrespective of price. I already understand that it is necessary to prevent, say, a 60-h.p. Napier car, the chassis of which costs £1,000, competing as a two-seater, and also that the clubs concerned desire to avoid the fiasco as shown under Tourist Trophy conditions, where cars have been specially built for that competition and priced irrespective of their sale value; but what possible object is there in handicapping a manufacturer out of giving the public ample power in a two-seated car, provided that such vehicle is being sold to the general public in hundreds at the same price as a two-seated car equipped with only one or two-cylinder engine?

My point of complaint is that I am prohibited from entering a Ford Junior Car, which is designed to carry only two persons, in either the Scottish Trials or Frome's Hill Climb, in consequence of the authorities

having tacitly admitted that the car is in a class to itself and has no competitors. Now, if the Scottish and Herefordshire Clubs would make an actual instead of the tacit admission, I would be well content; and for the guidance of those persons who pay attention to the awards of the Scottish and Herefordshire Clubs in Class 1 of their competitions, I beg to state that I hereby offer to submit the Ford Junior car to any test, for general reliability, average speed within the legal limit, hill-climbing and economy, based upon a handicap of price.

I contend that price is the real handicap, as in fact the Scottish Club themselves admit by classifying their competition under six heads defined according to price of chassis. There is, in my opinion, nothing more calculative to restrict proper enterprise in the automobile business than for a manufacturer to be handicapped out of giving ample power at a moderate price, and I shall be much obliged if you will publish my views as above expressed upon this matter.—Yours truly,

PERCIVAL L. D. PERRY.

SIX WHEELS OR FOUR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a motorist I have been much interested in the recent Automobile Club Side-Slip and Skid Prevention Competition, and the verdict of the judges appears to be so much at variance with the result of the trials that it is difficult to understand. It was obvious to all who were present at the trials at the Clement-Talbot works that the only device which succeeded in obviating the side-slip was a six-wheeled device entered by Mr. H. B. Molesworth. To quote from one of the subsequent newspaper reports, "With the exception of the three pairs of wheels the efforts of the others might, without exaggeration, be described as floundering."

An extract from another report states that, "Only one device, known as the Molesworth, succeeded in the trials imposed. The roadway used had been smeared with an attractive mixture of Thames mud, soft-soap and other emollients, applied to a thickness of some inches, and as it originally had a very steep camber, was about the thing one negotiates in nightmares. The vehicles contesting had to perform various hair-raising evolutions on this track, with the result that most of them were saved from utter demolition only by grace on the part of the observant angels and the dexterous use of sacks of shavings, applied in fender fashion. The 'bus fitted with the Molesworth device dashed down the course at a good fifteen miles per hour, braked suddenly and continued its course in a perfectly straight line! It waded in and out in a snake-like manner in the steering test, always travelling on its longitudinal axis. In short, it proved that the skidding problem has been solved." In the face of these statements it is difficult to understand how the judges could possibly have arrived at their decision. I enclose my card, and remain—Yours truly,

MOTORIST.

LOSS OF POWER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to "M. R. C. S.'s" query in the last issue of the *M.C.J.*, the speed of this car depends entirely upon the ratio of gears, if, of course, the ratio is only sufficient to give the speed mentioned, with the engine running at its maximum speed. The only remedy would be to raise the gear. This should only be done slightly, as I very much doubt if, with the h.p. mentioned, any great increase could be obtained.—Yours truly,

H. J. T.

CARS IN HYDE PARK.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am glad you are taking interest in the movement I initiated in the hope of getting our motorist friends to be able to use Hyde Park during the season.

Many people have sold their horses this year and depend entirely on their cars for carriage exercise, and it seems a very harsh measure to prevent them from driving in a park which they have used for years with their horses.

Some years ago, when the automobiles were not as perfect as they are to-day, there might have been some ground for such a prohibition, but to-day a well-kept car should be absolutely noiseless, and there is no reason why it should emit any obnoxious smell or vapour. In fact, a good petrol car should be practically just as unobjectionable as an electric car.

Under these circumstances, would it not be possible for cars to be admitted in Hyde Park, during the season, just the same as ordinary horse carriages? But, in any case, if the conservative methods are too strong for these radical changes, could we not arrange for a certain part of the park to be reserved to a certain extent to motor-car owners? For instance, the road leading from the powder magazine to Hyde Park Corner, which was very much used during the bicycle craze for cyclists, would make a very nice show ground for the latest motor equipages, which probably will be the feature of the coming season. Again, the road from Victoria Gate to Marble Arch might be allowed to be used for the same purpose.

Such a permission would mean a great deal of pleasure to the private owners, and, at the same time, would also be very important to the automobile industry generally, and there is no doubt that many ladies object to buying motor-cars for the very reason that they are not

allowed to use them in the park where they have been in the habit of driving.

I feel quite sure that, if you will lend your support to this movement others will follow, and, public opinion being on our side, this regrettable by-law will be removed.—Yours truly,

WROTH P. C. LETHBRIDGE.

A CAR AT THE CAPE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is now three years since my 10-12-h.p. Argyll car arrived in South Africa. She came tuned up and ready for the road. Within three hours of her arrival I unpacked the crate, filled up with oil and petrol, and ran out into the country! Since then she has continued to give every satisfaction, and has been not only useful, but, thanks to her steady running, a source of great pleasure, and has made many motor converts. During this period she has covered a distance of 13,447 miles. I have used her in all weathers, and for the past six months and more, have discarded my horses, using her constantly. Only twice has she failed me; the first time we dashed into a sand pit and damaged the differential gear, new pinions were made locally, but as they were out in cast steel, they were too brittle and did not last long. No blame can attach to the car for this accident. The second time, one of the governor weights broke its moorings and cracked the front of the aluminium casing, interfering with the 2 to 1 gear. Had the governor not been enclosed, I should not have needed help to bring the car home.

A Pekin-Paris Competitor and his outfit. [From a Caricature by "Mich"]

[In the "Auto."]

With these two exceptions, my repair bill has been practically nil, as I do all minor adjustments myself, and most of my "spares," some sent out with the car and others ordered at the suggestion of friends, remain untouched.

I have but one fault to find with the car, one shared by every British and Continental car I have come across so far, and that is, for our rough and sandy roads there might be more clearance.—Yours truly,

W. ROGER CHEW.

M.B. & C.M.Ed.

THE SIDE-SLIP COMPETITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Many of your readers were doubtless interested in the Royal Automobile Club Side-slip Trial Competition, the result of which has been made public.

To those who have followed the fortunes of the various devices through the severe and protracted tests imposed, the report and recommendations of the judges must appear incomprehensible, and quite at variance with the actual results and independent reports of the daily press and trade journals, almost without exception.

The report entirely ignores the results of the preliminary tests at Ladbroke Grove; it was universally acknowledged, and the 1,000 miles trials subsequently proved it to be the only test, so far as actual side-slip was concerned.

It was just as universally acknowledged that the only 'bus that would not side-slip was the Molesworth six-wheel device.

The last clause of the report contains an apologetic reference to this device, in which it says it was presented in a condition that did not do itself justice.

As responsible for the running of the 'bus during the trials, I had the authority of the Club secretary, after the test, that it had conformed in every respect to the requirements of the judges. Again, after the

1,000 miles test no effort was made by the Club to ascertain the merits or otherwise on the points mentioned in paragraph, 13 of the regulations.

To my knowledge not one of the judges even boarded the 'bus during the trials to test its efficiency and effectiveness. There was no official examination of the tyres either before or after the trial, and yet the recommendation specially mentions "the effect on the road and tyres." As regards the brake efficiency of the device, they were not even examined by the official observers, as running events proved. I repeatedly asked that the device be subjected to a separate brake and driving efficiency test without result.

Space forbids going into the other tests mentioned in this report. It is more a matter of regret that the Automobile Club should signalise its royal title by the report of a competition which, instead of discovering a device to prevent side-slip, will effectually prevent any further competition of the kind under its auspices.—Yours truly,

G. SIMPSON TAYLOR.

THE DUST NUISANCE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Is any of the dust raised by an automobile caused by disturbed atmosphere, and, if so, about what percentage; or is it entirely due to the action of the wheels on the road?—Yours truly,

A. C. M.

Messrs. H. M. HOBSON, LTD., ask us to warn all concerned in the motor trade against a man apparently between 25 and 30 years of age, medium height, clean shaven, and speaking with a foreign accent, who commences with a telephone communication to the effect that his principal is hung up in some country place, and that he requires some

The Motor Club.—A View of the Theatre.

tyres and also a space reserved for garage. A few hours later this person puts in an appearance, mentions some well-known name, saying he is disabled with a burst tyre and has been despatched for the purpose of obtaining a new one, and as soon as he gets the tyre fitted will bring the car in to garage on the following morning. Should he succeed in getting the tyre, nothing more is heard of him.

FROME'S HILL CLIMB.—Mr. D. M. Weigel writes that he has not entered a car in the Frome's Hill climb owing to the difficulty of comprehending the value of the formula given in connection with the event.

A CORRESPONDENT writes giving his favourable experience of the Imperial's Company's tyres fitted to the driving wheels of his 8-11-h.p. Peugeot.

THE Cadogan Garage and Motor Company, Ltd., inform us that Mr. Oswald L. Lister, their late managing director, has resigned his position, and has now completely severed his connection with the company. Mr. Frederick W. Moore, late of the Lancaster Motor Garage, has been elected to fill the vacant position.

So many are the sizes and so varied are the styles of finish of the well-known Bowden wire mechanism that it would probably puzzle the average buyer to remember the catalogue numbers pertaining to each without some aid to memory being provided him. This has been provided by the makers, the E. M. Bowden's Patents Syndicate, Ltd., by an ingenious system of numbering in series, the units 1, 2, 3, &c., representing the successive sizes of the mechanism, while the addition of the tens, 21, 22, 31, 32, and so on, describe variations in the style of finish. The system, which is fully tabulated in the firm's catalogue, should prove very handy when ordering.

CLUBS AND ASSOCIATIONS.

THE MOTOR CLUB.

THE Motor Club, which has just been established in premises at Prince's Buildings, Coventry Street, near Piccadilly Circus, London, W., has for chairman Col. W. J. Bosworth, with Sir Archibald J. Macdonald, Bart., as vice-chairman. The executive committee consists of Messrs. D'Arcy Baker, L. G. Dalzell, Harvey du Cros, jun., S. F. Edge, Walter Gibbons, Charles Jarrott, Maurice Jenks, Walter Jenks, J. Amery Parkes, S. Schlenheim, and Charles Temperley. The club has been formed by a number of influential motorists who have recognised the absence of a centrally-situated club house. Although the Automobile Association will have no definite interest in the club, the affairs will be administered in conformity with the spirit of that organisation, viz., "sportsmen working for sportsmen." One side of the building faces Coventry Street, the other Whitcomb Street, a broad side thoroughfare which will be of convenience for members arriving and departing in their cars. Among the attractions of the new club building is a theatre with sitting accommodation for 250 persons, and this will be utilised for entertainments and lectures on subjects of interest to motorists, while "the politics of motoring will be left to those institutions which already exist for dealing with them."

Adjoining the premises are the offices of the Automobile Association, and special arrangements have been made by which the cars of members will be stored, and, if desired, taken charge of at the door by the Club engineer. The terms of subscription to the Motor Club will be, town members five guineas, country members three guineas, foreign and colonial members one guinea. For members of the Automobile Association, the subscription to that organisation and the town membership of the Motor Club will be six guineas, and for country members four guineas for the joint subscription.

THE MOTOR UNION.

At the April meeting of the General Committee of the Motor Union there was a large attendance. Twenty-two automobile clubs in various parts of the country, in addition to the Royal A.C., the Commercial Motor Users' Association, the Auto-Cycle Club, and the individual members were represented.

Mr. C. D. Rose, M.P., Chairman of the Union, presided. It was reported that thirteen essays had been received for the competition on the subject of "Motor Legislation: Preparation for the Forthcoming Parliamentary Struggle."

Forty applications for legal advice and assistance on motoring matters and motoring questions were dealt with.

Mr. Rose stated that the Hon. Arthur Stanley, M.P., and himself had been added to the Standing Committee on Law to which the Lights on Vehicles Bill had been referred, and he expected that the Bill would come before the Committee next week.

A report was presented dealing with various private Parliamentary Bills, and in connection with the Ports-town and Hornsea Light Railway it was decided to oppose the order before the Board of Trade if necessary. It was also decided to approach the local club with regard to the provisions of the Sunderland Corporation Bill, in which it is proposed to inflict a penalty where any person drives any vehicle across any footway.

The Union decided to take fresh action in the matter of the Hayling Island Bridge tolls, information having been received that the lessee had re-imposed the charge of 1s. for motor-cars crossing the bridge.

The membership of the Union was reported to be upwards of 15,000.

YORKSHIRE A.C.

THE Yorkshire Automobile Club held their opening meet at Harrogate on Saturday; 200 members and friends were present and thoroughly enjoyed a very pleasant meeting. The club made the Hotel Majestic its headquarters, where the chairman, Mr. E. H. Hepper, and Mrs. Hepper entertained those present to afternoon tea, the guests including Mr. F. Braine, Dr. and Mrs. Hughes (Halifax), Dr. and Mrs. Williams (Halifax), Mr. and Mrs. J. W. Whitehead, Mr. and Mrs. Cooper (Ilkley), Mr. and Mrs. Comfort, Mr. Levich, Mr. Fred Shaw, Mr. and Mrs. A. W. Woodhead, Mr. and Mrs. J. M. Woodhead, Mr. and Mrs. T. Lea, Miss Shaw, Mr. H. Wood, Mr. Constantine and Mr. Constantine, jun., Mr. Scriven (Bradford), Mr. Waring, Mr. Palmer, Mr. and Mrs. A. Farnell (Bradford), Mr. and Mrs. Scott, Mr. and Mrs. Albert Braithwaite (Leeds), Mr. and Mrs. Walker (Bradford), Mr. Kent (Bradford), Mr. C. J. Tonstall, Mr. and Mrs. Bingham, Mr. and Mrs. J. W. Watson, Mr. and Mrs. Clough, Mr. and Mrs. Maugh (Bradford), Mr. J. E. Rhodes, Mr. Collinson, Mr. Sagar, (Halifax), Mr. Scoby Smith (Middlesbrough), Mr. E. A. Barker, Mr. J. F. Reddel, Superintendent Quest, and Mr. W. H. Hanson (Barnsley), Mr. and Mrs. L. Hey (Leeds), Mr. W. H. Arnold Forster, Mr. H.

Wyles, Mr. Robertshaw (Leeds), Mr. A. Towler (Ilkley), Mr. and Mrs. S. S. Dixon (Bradford), Mr. and Mrs. Pilling (Bradford), Mr. L. A. Whaley (Harrogate), Mr. J. A. Fawcett, Mr. H. Pickles (Leeds), Mr. W. J. Slingsby (Bradford), Mr. W. Tempest (Leeds), Mr. and Mrs. Rhodes, Mr. S. McFarlane and party, Mr. and Mrs. G. W. Blackburn (Harrogate), Mr. and Mrs. Robert Crossley, Mr. and Mrs. T. M. Cloughton, Mr. and Mrs. W. Penrose-Green (Leeds), Mr. G. Barrett (Leeds), Dr. S. and Mrs. Rumbell (Leeds), Mr. and Mrs. J. H. Pickford, Mr. and Mrs. W. Armitage, Mr. A. S. Russell, Mrs. Russell, Mr. and Mrs. R. Winn (Leeds), Mr. and Mrs. E. Faiers (Bradford), Mr. and Mrs. A. W. McLeod (Leeds), Mr. T. A. Hall (Leeds), Mr. H. D. Leather, Mr. R. Hepper, Mr. and Mrs. H. A. Jones (Bradford), Mr. Pickering, Mr. Campbell, Mr. and Mrs. Dunnington, Mr. H. Dunnington, Miss E. Dunnington, Dr. Hargreaves, Dr. Solly, and others.

MOTOR CYCLING CLUB.

A LARGE number of spectators witnessed the open hill climb of the Motor Cycling Club, at Sharpenhoe Hill, near Luton, on Saturday. The timekeepers were Messrs. F. Straight and F. T. Bidlake, and Messrs. Robert Todd, S. H. Fry, and A. G. Reynolds were the judges. The best times in each class were made as follows:—

MOTOR BICYCLES.

Class I. (3 starters).—Scales, $3\frac{1}{2}$ -h.p. Ryto, 1 min. 1 1-5 sec.; Legrand, 2 $\frac{1}{2}$ -h.p. Matchless, 1 min. 1 3-5 sec.; Gainsford, 3-h.p. Advance, 2 min. 3 1-5 sec.

Class II. (13 starters).—Brice, $3\frac{1}{2}$ -h.p. Brown, 46 3-5 sec.; Brodie, 5-h.p. Noble, 49 1-5 sec.; Webb, $3\frac{1}{2}$ -h.p. Quadrant, 54 sec.

Class III. (10 starters).—Genn, $4\frac{1}{2}$ -h.p. Minerva, 41 3-5 sec.; Wells, 5-h.p. Vindec, 45 sec.; Sale, 5-h.p. Vindec, 46 1-5 sec.

Class IV. (4 starters).—Collier, 6-h.p. Matchless, 41 3-5 sec.; Wells, 5-h.p. Vindec, 44 2-5 sec.; Sale, 5-h.p. Vindec, 45 2-5 sec.

PASSENGER CLASSES.

Class V.—Ilsey, 5-h.p. Phoenix, 2 min. 11 1-5 sec.

Class VI.—Montgomery, 5-h.p. Montgomery sidecar, 1 min. 56 3-5 sec.; Osborne, 5-h.p. Rex sidecar, 2 min. 14 3-5 sec.

Class VII.—Montgomery, 5-h.p. Montgomery sidecar, 1 min. 58 4-5 sec.

THE AUTO-CYCLE CLUB.

ENTRIES for the meet in the grounds of Mr. F. S. Philipson-Stowe, at Blackdown House, Fernhurst, on Saturday, May 11th, will be classified as follows:—

BICYCLES.

Class 1.—For machines not exceeding 110 lb. in weight, and with engines having a cylinder capacity not exceeding 300 cubic centimetres. Variable gears allowed. Class 2.—For machines with engines not exceeding 80 by 80, or 402 cubic centimetres. Class 3.—For machines with engines not exceeding 85 by 85, or 482 cubic centimetres. Class 4.—For machines with multi-cylinder engines. Each cylinder not to exceed 500 cubic centimetres. Class 5.—For machines with any size engine eligible in the above classes.

PASSENGER MOTOR-CYCLES.

Class 6.—Re-starting test.—In this competition machines will be sent off in the ordinary way and re-started on a steep portion of the hill. The medals to be awarded to the riders making the best time from the re-start to the finish. Class 7.—For machines not exceeding 100 by 100, or 780 cubic centimetres each cylinder.

In Classes 2 and 3 a silver medal to be awarded to the machine fitted with a variable gear which accomplishes the best performance. Silver and bronze medals will be awarded in each class, a gold medal being awarded for the most meritorious performance of the day.

BERKSHIRE.

THE annual meeting of the Berkshire A.C. was held at the Great Western Hotel, Reading, on Saturday, when Major E. R. Portal presided. It was reported that the membership had reached 120, and the balance in hand was £420. As an indication of the amount of business transacted it was mentioned that the hon. secretary's outward correspondence had amounted to no less than 444 letters, apart from notices of meetings, invitations for club meets, telegrams and other incidental communications, and it had been largely supplemented by that of the hon. treasurer.

The Chairman announced that only three nominations had been received for the three vacancies on the committee, these being in favour of Mr. Chas. H. Dodd, Mr. R. H. C. Harrison, and Dr. Norman H. Joy, whom he declared to be duly elected. It was decided to admit ladies to membership. A lengthy discussion took place on the question of the tar-spraying competition, and disappointment was expressed that the Roads Improvement Association had not seen its way to accept the invitation of the club to conduct these tests in Berkshire. The Chairman, in reply to Mr. J. Fredk. Hawkins, informed the meeting that no effort had been spared, both by offers of financial help and general co-operation, to bring these trials into the county; but the committee of the Roads Improvement Association had been reluctantly compelled, from a variety of considerations, to select a stretch of road outside the club's area. The debate was continued by most of those present, and the following resolution was ultimately adopted unanimously:—"That a sum not exceeding

£100 be spent at the discretion of the club committee in connection with the forthcoming tar-spraying trials of the Roads Improvement Association, provided that the section of the tests upon gravel roads can be held in the neighbourhood of Ascot." It was decided to make arrangements for the holding of a club luncheon, and that this should be on a Saturday about the end of May, if possible. The business concluded with votes of thanks to the honorary officers of the club.

VICTORIA.

THE Automobile Club of Victoria (Melbourne, Australia), held their annual meeting at the club rooms, Collins Street, on March 15th. The annual report and balance-sheet was adopted, and the following officers appointed or elected:—Patron, His Excellency the Governor of Victoria, Sir Reginald Talbot; president, Sir John Madden, Chief Justice and Lieut.-Governor of Victoria; vice-presidents, Hon. Frank Stuart, Dr. Weigall, and Mr. Harry Maddox; treasurer, Mr. E. C. Holmes; auditors, Mr. F. G. Wilson, F.I.A.A., and Mr. Thos. Rollason; committee (in addition to those whose term has not expired), Dr. Vance, Messrs. W. R. Grimwade, J. Beswicke, G. Corlett, and J. Brockelbank. Several important matters were dealt with, including the question of removing to other club premises. The club held a reception the following evening at the club rooms to welcome their president, who has just returned from a lengthy tour round the world.

SOUTHERN MOTOR CLUB.

THIS club will hold an open hill climb on June 22nd under the auspices of the Royal A.C. There will be seven classes for various sized cars, and gold medals and certificates will be awarded in each. A

The Motor Cycling Club's Sharpenhoe Hill Climb on Saturday.

[E. W. Ashworth.

silver medal will be given to the car doing the best performance of the day. One specially interesting class will be that for cars ridden in the Tourist Trophy Race without alteration to the engine or gears used. The novelty of this fixture will be the class for lady drivers only. Entries can now be received by the Sports Secretary, Mr. S. W. Phillpott, 18, Gosberton Road, Balham.

IRISH MOTOR YACHT CLUB.

THE new Irish Motor Yacht Club, which is to be affiliated to the Motor Yacht Club, is rapidly growing in numbers, and is commencing work in a vigorous fashion. A very attractive programme, of which particulars will be published shortly, has been sketched out for the coming season. A fortnight's meeting on the Shannon is proposed, which should attract marine motorists from every part of Ireland, and, doubtless, not a few from this country as well.

ESSEX.

THE season's opening meet of the Essex Automobile Club was held at Braintree. After luncheon a competition followed for the cleanest engine and mechanical parts after running thirty miles. Mr. H. M. Fletcher, of Loughton, offered a silver and bronze medal as prizes, and Messrs. T. Clarkson, Chelmsford, and G. C. Tjou, Woodford, acted as judges. The awards were as follow:—1, Mr. Burnett Tabrum, J.P.; 2, Mr. Gurney Fowler.

THE first meet of the Liverpool A.C. for the season will be held to-day (Saturday), between 3 and 5 p.m., at the Brine Baths Hotel, Nantwich, by the invitation of Mr. Wm. Becket Hill (chairman o

the club) and Mrs. William Becket Hill, who are entertaining members and their friends to tea.

THE Junior A.C. will hold a speed judging test on the 11th prox.

THE Limerick A.C. have inaugurated their season with a speed judging competition.

A CLUB is being formed among the motor-cyclists of Acton, Chiswick, Hanwell, and Southall.

TO-DAY (Saturday) the Leicester, Derby, Nottinghamshire and Wolverhampton A.C.'s will hold their inter-club meet at Ashby-de-la-Zouch.

THE members of the Motor Cycling Club will hold their annual London to Edinburgh run on the 17th prox. This event is open only to members of the club.

THE Sackville Hotel, at Bexhill, will be the headquarters of the Crystal Palace Automobile Club during the races to be held on the Bexhill track at Whitsuntide.

THE Bohemian Motor Club, of which Mr. F. J. Ellis, 40, Genesta Road, Plumstead, S.E., is secretary, will hold a motor-cycle meeting on the Canning Town Track on the 4th prox.

AT a meeting of the Wirral and District Automobile Club held last week, the name was changed to the Cheshire Automobile Club. Mr. J. Alfred S. Hassal, 6, Lord Street, Liverpool, is the hon. sec.

THE fixture list of the Leicestershire A.C. for the season is conveniently arranged for the pocket, and in addition to the usual information contains a suggestion that members should continue to drive with care and consideration for other users of the road.

CASES UNDER THE MOTOR CAR ACT.

EXCEEDING THE TEN MILES LIMIT.

The Kingston-on-Thames borough justices have imposed fines of £3 and 12s. costs on three motorists for exceeding the ten miles an hour speed limit which is in force in the principal streets of the borough, while a motor-cyclist, for a similar offence, was ordered to pay £1 and costs. The Bench dismissed a summons against Herbert Otto, of 125, Evering Road, Stoke Newington, for exceeding the ten mile speed limit with a motor-car, for, although the police, who timed him with a stop-watch alleged that his pace was twenty-five miles and 1,515 yards an hour, defendant said that he kept close behind one of the electric tramcars, which the conductor stated was travelling at about twelve miles an hour.

CASES AT LEEDS.

At Leeds Police Court, Oscar Martin, of Edgerton, Huddersfield, has been fined £5 and costs for driving a motor-car to the public danger, and Harold Chambers, chauffeur, was ordered to pay 20s. and costs for failing to produce his licence. Sergeant Brook stated that on the day in question the car was driven up Briggate at a furious pace—some seventeen miles an hour. Several pedestrians had to hurriedly get out of the way. The car turned round into Upperhead Row. The police afterwards learned that it had gone into Lands Lane, and it was found unattended at the top of the arcade.

NO LIGHT.

J. William Fowler, engineer, Twywell, was summoned at the Thrapston Police Court for being the driver of a motor-car not having a lighted lamp at the rear of the same, at Ringstead, on March 26th. —Defendant said it was quite by accident that the lamp was out. It was a very light night, and it was impossible to detect that the lamp was out. It was re-lighted and burnt quite brightly. He had driven a motor for six or seven years, and had been very careful as regards the regulations. The constable in his evidence said that as soon as he blew his whistle Mr. Fowler stopped the car. The licence was promptly shown and the lamp relit; but that did not prevent a fine of 1s. and 6s. costs—one of those irritating circumstances to which motorists have to submit with as good a grace as they can.

DAINGEROUS DRIVING.

Lord Vernon (a minor) has been convicted by the Bakewell magistrates for driving a motor-car to the danger of the public. Mr. William Nixon, who presided over the Bench, asked the defending solicitor how it was that an admitted previous conviction at Manchester was not endorsed on the licence, and was assured that it was not the practice of the stipendiary to do this unless he considered the case of such seriousness as to warrant it. Mr. Nixon replied that his interpretation of the law was that it gave them no option but to endorse the licence in the case of every conviction, and at Bakewell they could not follow the Manchester stipendiary's example. In imposing a fine of 40s. and endorsing the licence, Mr. Nixon expressed the hope that Lord Vernon would see the propriety of paying greater respect to other people's safety.

William Hicks has been summoned at Brighton Bench for driving a motor-car in a manner dangerous to the public, having regard to all the circumstances of the case, on Grand Junction Road on March 31st. The chief constable (Mr. W. B. Gentle), in his opening statement, mentioned that, in trying to pass another motor-car, defendant drove his car so that, although the constable on point duty jumped out of the way, the wing of the car caught him and "bowed him over like a ninepin." After some deliberation the magistrates imposed a fine of 50s. and costs, or a month's imprisonment.

EXCEEDING LEGAL LIMIT.

Seven defendants were fined sums varying from £3 to £5 each at the Horsham Court last week for exceeding the legal speed. Before the

cases were heard, the clerk read a memorial from the inhabitants of Cowfold on the subject of the dangers of excessive speed, and begging that action should be taken in the matter.

A batch of motorists, stopped in the Arundel district during Easter for exceeding the limit, have been summoned at the Arundel County Bench. Fines of 30s., £4, and £5 were imposed. Ernest Herbert Renton, of Clapham Road, S.W., pleaded guilty to driving a motor-car on March 31st at the rate of 27 miles and 480 yards per hour, at Walberton. P.C. Alce stated that when defendant was stopped another car drove up and the occupant remarked that their scout was at the back and signalled the road "all clear." Defendant submitted that it was hardly fair to place a trap on such a steep incline. He had his brake on going down the hill, perfectly well knowing that in Arundel they regarded the question of the speed limit rather strongly. He had no wish to offend or get into trouble, and he was endeavouring to keep his car down to the limit. When he was stopped a passing tramp remarked that it was a shame. Defendant was ordered to pay a fine of £4 and 9s. costs.

DE DIETRICH DEVELOPMENTS.

ALTHOUGH various rumours have been in circulation during the past month or so with regard to impending developments of the De Dietrich business in this country, we have refrained from referring to the same until the various negotiations had been completed and we were in a position to give accurate and official information. This being now available, we hasten to give publicity to the facts, for which we are indebted to Mr. W. M. Letts. At one time the firm of De Dietrich and Company, of Luneville, was simply known as manufacturers of railway rolling stock, it not being until ten or eleven years ago that they commenced the construction of motor-cars, with Baron de Turckheim at the head of affairs. It was then all one concern, but two or three years ago the railway branch was separated from the motor business, the later being given the title of La Société Lorraine des Anciens Etablissements de Dietrich et Cie, de Luneville, with a capital, we believe, of £200,000. Last year, owing to the development of their business, the capital was raised to £300,000, and just recently, owing to a further and larger increase in demand, and to further contemplated extension in the direction of establishing factories in different parts, their capital has been increased to no less than £600,000, which amount has been very largely over-subscribed, there being consequently no intention of asking the public to subscribe to any of their various enterprises. One of the rumours that have been current has had reference to the Isotta-Fraschini factory at Milan. What has really happened in connection with this is that the De Dietrich concern, wishing to find another factory, as Luneville was not capable of turning out as many cars as they wanted, started negotiations with the Isotta-Fraschini Company, and eventually secured a large interest in that undertaking. The cars which will be manufactured in Italy will all be designed from the central office, the same as those to be built in England, and will bear the name De Dietrich, and carry the Lorraine cross, the trade mark of the Société Lorraine. With respect to England, Messrs. Jarrott and Letts some two years ago secured the manufacturing rights for De Dietrich for this country, but the Société Lorraine, wishing to come themselves and manufacture over here, opened up negotiations with these gentlemen, with the result that they sold the rights back again to the Société Lorraine, and that a company called "Lorraine Dietrich, Ltd.," controlled by the Société Lorraine, of Luneville, has been formed. The capital of £100,000 has all been taken up, so that there will be no flotation here. The following comprise the board of Lorraine Dietrich, Ltd.:— Lord Ribblesdale (chairman), Sir West Ridgeway, Richard de Neuville, Prince d'Arenberg, Baron de Turckheim, M. Ernest Carnot (son of late President of the French Republic), M. Estier (vice-president of the Société Lorraine des A. E. de Dietrich and Company, de Luneville), M. Leon Turcat, and W. M. Letts. The company has purchased the Ariel factory at Birmingham, taking it over with all its machinery, plant, and freehold land adjoining, and the manufacture of De Dietrich cars will be commenced there almost immediately under the direction of Mr. Charles Sangter. Finally we may mention that the general idea of the De Dietrich policy is that the various models which will be manufactured in the different factories will be settled by the different boards, who will all meet either in Paris, London or Milan, as may be necessary, to decide.

THE Rushmore motor lamps are being used in connection with the Entente Cordiale motor service between London and Paris.

AN attractive show card has been issued by Messrs. J. and R. Oldfield, of Birmingham, the makers of the Dependence lamp, a new catalogue of which has just been issued.

THE Electric and Ordnance Accessories Company, Ltd., Stellite Works, Cheston Road, Aston, Birmingham, inform us that they have special machinery for manufacturing high grade springs for motor-cars, and are also well equipped with automatic gear cutting machinery for spur, spiral and bevel wheels.

MR. ARTHUR HOARE, the managing director of the Bombay Motor Car Company, Ltd., is shortly coming to England on a few months' leave. As Mr. Hoare contemplates arranging fresh agencies and otherwise expanding the business of his company in India, it may be useful to mention that British manufacturers can get into communication with him c/o. Messrs. John Birch and Company, Ltd., 3, London Wall Buildings, London, E.C.

ROAD REPORTS.

THE Surrey County Council and the Rural District Council of Reigate have just entered into an arrangement to tar long stretches of the main road before the Whitsun traffic.

THORNS ON THE ROADS.—The Turriff District Committee of the Aberdeen County Council had before them last week a communication with reference to thorns and glass strewn on the highways. The sanitary inspector stated that the nuisance that road users complained of, as well as the scattering of pieces of barbed wire about the roads, cost him on an average twenty shillings per annum for repairs to the tyres of his cycle. It was eventually agreed to instruct the road surveyor to call the attention of people who might lay down the things complained of to the danger they entailed.

OXFORD.—Addressing a recent meeting of the County Council, Viscount Valentia, M.P., the chairman, pointed out that the mileage of main roads in Oxfordshire was 486. The average cost for three years of rural roads was £55 per mile; that of urban roads £130. The total cost of the roads for the past year was £29,731. The Motor Car Act, 1903, which has been extended for another year, imposed considerable administrative work on the council in registering cars and

Council, and the surveyors of the various Rural District Councils in West Sussex. The tar was sprayed on the road under an air pressure of 350 lb. to the square inch. The sprayer has very much the appearance of a water-cart, and consisted of a motor-trolley with a tank attached and an appliance which evenly distributes ordinary coal gas tar over the road, forcing it on to the surface at such a pressure as to drive it well into the macadam. Granite responds most readily to the treatment as it provides a clean surface. The tar is heated as the steam motor is propelled over the road, and the distribution is effected through six nozzles, the nozzles being about one foot from the ground and surrounded by a tarpaulin sheet to prevent the sprayed tar from being spread upon anything but the road. A width of about 7 ft. 6 in. was covered in one operation, and a mile of roadway, one width, can be covered in an hour. The roads were quite dry, and had been prepared by the County Surveyor (Mr. McIntosh) for the purpose of the demonstration.

KENT.—The main road through the village of Dunton Green, in Kent, has been much improved by the application of tar for the purpose of allaying the dust nuisance. Last summer the question of doing this work was raised by members of the Otford Parish Council, who approached the Royal A.C. and the Motor Union with the view that

Motoring in Java.—Crossing a River by the Ferry near Soerabaija.

[De Auto.

cycles and granting and renewing drivers' licences. The total fees for three years amounted to £817 3s., and these fees go to the County Fund.

HARROW.—At Harrow Weald, Sir W. J. Crump, J.P., and Messrs. Gore and Lush propose to treat the highways near their premises with a special preparation to allay the dust.

CAMBERLEY.—At Camberley, through which about three miles of the main road from London to Basingstoke, Southampton, and the south-west of England runs, the effect of motor traffic has been pretty considerable. During one day of the Easter holidays over 500 motor-driven vehicles were counted passing through. The local district council, under contract with the Surrey County Council, maintain five miles and seven furlongs of main roads at a cost of £1,000 a year, which works out at a rate of 4d. in the pound. Before the introduction of motor traffic these roads were maintained at a cost of £5 per mile per year. Now the cost is said to be £200 per mile per year.

HORSHAM.—At Horsham last week a demonstration was made with a Tarspra machine. The experiment took place on about a mile of roadway at Roffey, and was closely watched by many members of the West Sussex County Council, including the chairman, Earl Winterton, Lord Leonfield, and General Godman, officials of the

motorists might assist by contributing towards the expense. The total cost was £80. The Kent County Council agreed to contribute one half and the parishioners undertook to raise £15. The Royal A.C. and the Motor Union then decided to contribute the remaining £15. One coat of tar has already been applied with beneficial results, and the second coating is expected to be completed very shortly. The efforts made have been much appreciated by the villagers, and Mr. A. E. Partridge, hon. secretary of the Parochial Committee in charge of the matter, states in a letter just received that the committee are very grateful for the help of the motoring organisations.

YORKSHIRE.—With reference to the laying of three miles of roadway between Fullord and Escrick with tar macadam, reported last week, we are informed by Mr. F. A. Camidge, the solicitor to the Escrick Rural District Council, that it would be well if all motor traffic were diverted from the road in question for about six weeks.

MOTOR JOBMASTERS, LTD., of Westminster, are furnishing liveried chauffeurs with their motor-cars on hire.

MESSRS. ALFRED HERBERT, LTD., have issued a new edition of their catalogue, Section E., containing full descriptions of their capstan lathes.

COMPANY NEWS.

NEW COMPANIES REGISTERED.

THE BORDER MOTOR AND CYCLE COMPANY.—Registered with a capital of £1,500, and office at Galashiels.

PREMIER ACCUMULATOR COMPANY.—£40,000. To acquire the business of electrical engineers carried on by Messrs. A. Schanschieff and H. Stephens at Northampton, as the Premier Accumulator Company. First directors, Messrs. Stephens and A. Schanschieff. Cattle Market Road, Northampton.

RENARD ROAD AND RAIL TRANSPORT CORPORATION.—£250,000. To adopt an agreement with Edward Surcouf et Compagnie, Renard Syndicate, Limited, and Seymour and Gordon, Limited, and to carry on the business of manufacturers, buyers, sellers, and letters to hire of motor-cars and other conveyances, &c. The signatories include Lord Ribblesdale, Messrs. E. Manville, P. Dawson, Claude G. Hay, M.P., and Major-General J. C. Ardagh, R.E.

THE AUTO-CYCLE CLUB'S TRIAL.

THE Auto-Cycle Club's quarterly trial was held over the usual 125 miles course, starting and finishing at Uxbridge, on the 18th inst. There were nineteen starters, three passenger machines and four motor-bicycles being entered in the new light-weight class. None of the latter made non-stop runs. One of them, the 1½-h.p. F.N., ridden by W. Leamaar, had only one stop, but the other three retired.

The fastest times up Dashwood Hill were made by the following:—M. Geiger, 6-h.p. N.S.U., 1 min. 11 3-5 sec., 1; O. C. Godfrey, 5-h.p. Rex, 1 min. 12 sec., 2; F. W. Applebee, 3½-h.p. Rex, 1 min. 45 1-5 sec., 3. The fastest machine in the passenger class was M. W. Randle's 10-h.p. Lagonda, 2 min. 10 3-5 sec.

Non-stops were made by:—Motor Bicycles: R. Stote Fox, 4½-h.p. F.N.; O. C. Godfrey, 5-h.p. Rex; J. D. Hamilton, 3½-h.p. N.S.U.; S. Foreman, 3-h.p. G.B.; W. G. McMinnies, 5-h.p. Vindec Special; and F. W. Applebee, 3½-h.p. Rex.

Passenger Machines.—M. W. Randle, 10-h.p. Lagonda; G. Aldington, 5-h.p. Kerry Abingdon; C. A. Ringwood, 9-h.p. Riley.

DRIVING ACROSS THE FOOTPATH AT BLACKPOOL.

THE Blackpool magistrates have had before them seventeen summonses against a number of employees of Motors (Blackpool), Ltd., the proprietors of a motor garage on Central Beach, for driving motor-cars across the footpath. Mr. Hodgson, who defended, stated that in view of the decision in favour of the Corporation in the test case taken to Quarter Sessions, it had been agreed to pay a penalty in one case, the others to be withdrawn on payment of costs, which were heavy. The learned chairman of the Quarter Sessions had agreed to state a case, and, without prejudice, in the event of its being carried further, the defendant in the first case pleaded guilty. The Bench imposed a fine of 2s. 6d. and costs in the first case, and costs only in the remainder.

PUBLIC MOTOR SERVICES.

MR. GIBBON BROOKS is making application to the Watch Committee of Cardiff for licences for six motor-cabs, which he proposes to place upon the streets of the town for hire at fares similar to those in vogue in the metropolis.

A PROPOSAL to licence motor vehicles for service in Ramsgate has been placed before the local authorities.

THE Hon. Walter Guinness, L.C.C., speaking at the annual meeting of the Hackney Carriage Proprietors' Provident Institution, said the results attending the introduction of taximeter motor-cabs in Paris showed that such vehicles were not going to have things all their own way. Although they were paying very well in London at present it was doubtful whether they would be so profitable when competition became keener.

THE Lancashire and Yorkshire Railway Company have made a beginning with their motor-'bus services in the County Palatine.

MOTOR-'BUS ACCIDENT.

A REMARKABLE scene was witnessed on Saturday night in Fulham Road. Thirty-seven members of the cyclist company of the 4th Volunteer Battalion Royal Fusiliers were riding in a narrow part of the road, when a motor-omnibus, in order to avoid a stationary cart, deviated to the right and struck one of the cyclists, who was thrown to the ground, one of the wheels of the omnibus passing over his right arm. Thirty-five of the Volunteers, who were riding at the rate of about ten miles an hour, came on, and one after the other were thrown to the ground. Many sustained slight injuries and numerous machines were damaged.

POLICE TRAPS.

IN St. George's Road, Southwark, the police have measured a furlong along which the drivers of motor-'buses are timed.

THE Kingston police trap is now in full working order, to the discomfort of motorists going that way.

SUSPICIONS of a police trap along Briggate, Leeds, have been aroused in the minds of local motorists, owing to the activity of the police against drivers in that thoroughfare during the last few days.

SEVERAL police traps are in operation on the road from Kendal to Windermere, and motorists in the Lake District should take heed of this warning.

INDIGNATION is being freely expressed locally at Henley-on-Thames at the action of the police in trapping motorists on the Fair Mile. It is thought that if the present official attitude is continued it may do injury to the place during the coming boating season.

LATE in the evening the police are amusing themselves by trapping motorists over a measured furlong in Portland Place, Regent's Park.

TIMES have been taken on Hillingdon Hill, near Uxbridge, during the last few days.

BUSINESS NEWS.

DUNLOP tyres were fitted to the Napier car on which Mr. E. A. Paul made his record run to Monto Carlo.

A NEW list of the Sawyer Non-Skid bands has just been issued and can be obtained from the Motor Stores, 315, Euston Road, N.W., where a complete selection of the three styles in which these well-known non-skids are made can be seen.

WE learn that the Bowden Auxiliary Air Inlet, described in our columns towards the end of last year, has been remodelled for 1907. The pattern of the air holes has also been modified to allow of a more minute gradation of the amount of air admitted.

MESSRS. HARVEY FROST AND COMPANY, LTD., 39, Great Eastern Street, E.C., have issued a useful little book on the subject of repairing motor tubes. It is likely to be of service to all motorists, and Messrs. Harvey Frost will be pleased to send copies to readers of the *M.C.J.*

WRITING to the *British Medical Journal*, Dr. A. Howard Pirie states that he began his motoring career as an absolute novice with a Speedwell car a year and seven months ago, and that his expenses for repairs have so far amounted to 17s. 6d. "I drive myself, and have a lad to clean the car. I have the car out almost every day, and have been to Land's End and back with it, and had it with me on two other holiday tours. For reliability and freedom from repairs I think it will be difficult to beat the record of this car. It climbed into and out of Lynmouth last year, and anyone who knows these hills knows how often a horse is required to help a car there. It has never failed to climb a hill or any road so far."

VIEO, LTD., 14, New Burlington Street, London, W., have sent us a photograph of a Hall motor lorry fitted with Vieo wheels, which has now been subjected to the severe test of 9,500 miles, and, according to the users, the wheels have saved them considerable expense, as, when compared with other lorries that they have had in use doing similar work fitted with ordinary wheels, the latter have had to be rebuilt at least three times during the same time in which the pair of Vieo wheels have been running. The lorry weighs three tons unladen, and has been carrying an average daily weight of two-and-a-half tons, at speeds from seven or eight miles per hour, so that they have been used for fairly heavy work. The only repairs which have been effected to the Vieo wheels during the whole of their running are the replacement of the iron tyre on the floating rims owing to their cracking, apparently at the weld, because they were too light in the first instance, some of the rubber rollers have also been renewed, but the wheels now appear quite as fit for their work as they did at first.

THE VULCAN MOTOR AND ENGINEERING COMPANY (1906), LTD., Southport, inform us that their 14-h.p. car which performed in the flexibility trials was of their standard type, supplied to the London and Parisian Motor Company, Ltd., last November, and has run some thousands of miles in various parts of the country since. The car can be inspected at the London agent's garage, Burwood Mews, Burwood Place, London, W.

MR. HORACE WALKER, of Bristol, has written to the Deasy Company stating that his 24-h.p. Deasy car has done 1,500 miles since leaving the works, and that he has had no trouble, nothing having been touched since the first 100 miles, when a few minor adjustments were made.

THE body of the new Leader car illustrated in our last week's issue was, we learn, built by the Waterloo Motor Works, of Chicheley Street, York Road, S.E., and turned out complete within three weeks from the date of order. Since this company's coach-building department was started six months ago the staff in this department has been increased from two to twelve men, orders being at present in hand for ten bodies and several Cape hoods and wind screens.

MESSRS. HUMBER, LTD., will be pleased to send the address of their nearest depot or agent to prospective purchasers of their cars. They ask us to state that their guarantee only applies to cars which are obtained direct from themselves or their duly appointed agents.

THE BARON DE TURCKHEIM, head of the Societe Lorraine des Anciens Etablissements de Dietrich and Cie, of Luneville, has just been appointed a Knight of the Legion of Honour, this distinction being bestowed upon him by the French Government in recognition of his having so largely developed the industrial movement in the east of France. It is also interesting to note that up to eleven years ago the De Dietrich Company was only known in connection with the building of railway rolling stock, and that the Baron Turckheim was instrumental in persuading them to enter the motor industry, since when this branch has developed to an enormous extent.

THE Motor-Car Journal.

VOL. IX.]

LONDON, SATURDAY, MAY 4, 1907.

[No. 436.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

OWING to the fact that the entries for the International Heavy Touring Car Race are not sufficiently numerous to justify the setting apart of a separate day for that race, it has been arranged that it shall take place at the same time as the International Tourist Trophy Race. Instead of the formerly announced dates of these races (the last Tuesday and Thursday of May), Wednesday, May 29th, has been chosen for the double event. The "Graphic" Trophy Race is set down for Thursday, the 30th, and it is possible that the Auto-Cycle Club's big race will also be held on the Thursday. This event will immediately follow the Irish Reliability Trials announced for May 22-25, and which have attracted an entry list of nearly a hundred. Evidently the summer months are to be a busy time for motorists generally.

The Commercial Vehicle Trials.

THE supplementary regulations of the Commercial Vehicle Trials to be held in September next—commencing on the 9th of the month and continuing for about four weeks—have now been issued. As we mentioned last week, the test will take the form of a tour passing through the chief commercial centres of England and possibly Scotland, and will be conducted on the lines of the famous 1,000 Miles Trial of 1900. Entries should be sent in by July 13th, and after August 10th no further entries will be accepted. The classification will be as follows:—Class A, for vehicles carrying net loads of 10 cwt.; B, 20 cwt.; C, 30 cwt.; D, 40 cwt.; E, 60 cwt.; F, 100 cwt.; G, 120 cwt. The approximate mileage per day for each class will range from seventy to thirty, and all the vehicles entered must comply with the Acts of Parliament and Statutory Orders relating to such motor-vehicles. In making the awards the judges will take into consideration the selling price and the performance of the vehicle in regard to: accessibility; adequacy of platform area and convenience for loading; adhesion; ease of manipulation; finish and workmanship; freedom from nuisance to the public, e.g., smoke; general appearance; brakes; condition after trial; cost of carriage per net ton-mile; cleanliness; hill-climbing; manoeuvring; quiet running; repairs and replacements; springs and steering gear.

Frome's Hill.

THE Frome's Hill climb of the Herefordshire A.C. has become an event of considerable importance in the motor-world, and this year's competition, taking place on Friday, the 3rd inst., has attracted 110 competitors with cars and a couple of motor-cycle entrants. The cars range from the 6-h.p. Rover to the 40-50-h.p. Gracile which Mr. C. H. Saunders will drive, and the 40-50-h.p. Richard-Brasier entered by Mrs. A. M. Foster. Count Kolowrat (Laurin and Klement), Viscount Ingestre (Clement-Talbot), Capt. G. L. Hinde-Howell (Iris), Capt. W. E. Owen (Junior), Capt. Hughes Morgan (Daimler), Messrs. C. Jarrott (Sizaire-Naudin), E. Lisle, jun. (Royal Starling), F. Eason (Buick), T. Rimner (Vulcan), H. W. Cranham (Horbiok), H. Luff Smith (Siddeley), W. M. Letts (Sizaire-Naudin), C. Friswell (Standard), J. E. Hutton (Berliet), P.

Brodthmann (Daimler), Cecil Edge (Napier), F. F. Wellington (Spyker), and G. O. Thompson (Straker-Squire) are among the entrants, and, given a day of decent weather, a very enjoyable as well as interesting time should be spent under the auspices of the Herefordshire Club.

Trials at Saltburn.

THE Yorkshire A.C., which, by the way, held the second meet of the season at Boroughbridge on Saturday, has decided to hold some important speed trials at Saltburn on Saturday, the 22nd prox. There will be thirteen events, ten of which will be for touring cars, the remainder for racing vehicles. Several valuable trophies will be competed for, and the Marquis of Zetland, as well as the local Urban District Council, is lending support, while adequate policing arrangements will be made by Major Bower, the Chief Constable of the North Riding of Yorkshire. Intending competitors can obtain further details with regard to this interesting meet from Mr. C. P. Wilson, the hon. secretary of the Yorkshire A.C., Town Hall Chambers, Victoria Square, Leeds.

An Australian Club.

THE annual report of the Automobile Club of Victoria just to hand has many features in common with the yearly reviews which come to us from motoring organisations here at home. The committee found it necessary last year to form a Motor Defence Fund with objects somewhat similar to those of the Motor Union, and its value has been seen in the withdrawal of several threatened actions by the police. The mere existence of such an organisation has had a good effect. The club is fostering an agitation in support of the main roads becoming a national care, and is urging upon local authorities the importance of maintaining the highways in a useable state. Lectures, debates, tours and runs, petrol consumption tests, speed trials, and similar events made up the year's programme of this Australian organisation, which, by the way, has appointed as its official organ the colonial "Punch."

MR. A. W. GAMAGE is so well known to the motor world—both in connection with the popularisation of the sport, as witness the contests he has incited between the North London and the Southern clubs, and as one who provides them with everything they want—that the coming of age of his eldest son is a matter of general interest. So far as Mr. Eric Muir Gamage is concerned he was feted and honoured at a dinner at the Holborn Restaurant, when over 800 guests assembled to offer their congratulations to father and son. It was a happy gathering, with heads of departments and employees genially clinking glasses in honour of the event, and genuinely demonstrating their esteem for the house they serve. The speechmaking was hearty and unconventional, and the way in which Mr. A. W. Gamage testified to the good work done by all about him revealed a touch of that appreciation of the efforts of others which is one of the healthiest factors in business generally.

"Gamage, Holborn."

and has proved of vital value in the development of the great establishment in Holborn. At the festive gathering Messrs. J. Dunn, W. A. Vincent, and J. S. Carter were vice-chairmen, with Mr. A. W. Gamage at the head of the table.

Great Expectations of the Amir.

WE have all heard the story of the man who, apparently "of great possessions," wandered round an exhibition eagerly scrutinised by the attendants and courteously informed by all with cars to sell, ultimately disappointing everybody by buying just nothing at all. Great expectations seem to have been indulged in by the attendants at the various stands at the Calcutta Motor Car Exhibition when the Amir of Afghanistan visited that display during his memorable trip to India. His Majesty decided to devote a morning to inspecting the exhibits, and frock coats and top hats were duly donned for the occasion. "Show polish" was plentiful about the show, and all were craning their necks and smiling their sweetest to beguile the ruler of Afghanistan their way. His questioning at the various stalls was suggestive of great things to come, and he

H.M. the Amir of Afghanistan alighting from the Siddeley Car which he used during his recent stay in Bombay.
His Majesty expressed the greatest satisfaction with the quietness and smooth running of this vehicle, and, as a mark of his pleasure, specially appointed the Wolseley Company's agents in Bombay to his service.

went into the minutest details with regard to the merits of most of the cars. So great was the Amir's interest in the exhibition that the spirits of motor-car dealers waxed high, while one sage attached to the Amir's staff thought it probable that the Amir would purchase the entire exhibition. Such, however, was not His Majesty's intention, for after visiting every stall, sitting in the cars, blowing the horns, and turning on the lubricators, His Majesty announced his choice, and forthwith purchased one acetylene lamp!

'Ware the Whistle.

Not so very long ago motorists were inclined to scrutinise the feet of loungers on the highway, the presence of big boots generally being regarded as indicative of the presence of policemen in disguise. When we had become expert in that point of view the methods of the foemen changed somewhat, and the big boots were secluded behind hedgerows, while handkerchiefs waving in the breeze supplied the motorists with a clue as to the presence of blue officialdom. Again methods have veered, and heed must now be paid to any whistling that seems

to come from the hedgerows. Mr. Max Pemberton, who writes stories as well as drives cars, was found in a police trap at Henley, and duly appeared in the police court. The superintendent acknowledged that the Fair Mile was, as we have recently informed readers, the centre of local police operations. He said he had the distance measured for a trap, and about ten yards was added to the 440 yards to allow a "run in." Then the police constable came forward and told the Bench that he was at the end of the trap, and started his watch the moment the car entered the measured distance on receiving the signal from his brother officer. He had to stand in a barrow in order to see the starting signal. When the car got out of the distance he whistled to another constable to stop the car. Cross-examined, he said he had had experience of timing with Inspector Jarrett, so that he knew the method very well. But after Mr. Pemberton had testified to his knowledge of the existence of the trap and to the presence of a speedometer on the car registering 15 miles an hour when the police stopped him, the magistrates dismissed the case. Not even the whistle of the policeman trained by Inspector Jarrett could secure a conviction.

Motor Cabs in London.

LONDON will soon see a great development in the motor-cab business, which has already done something to improve the aspect of the city. The appearance of the stylish vehicles with their open or closed tops, according to the vagaries of the weather, has certainly made a good impression on visitors to as well as residents in the Metropolis, and that this has sound financial basis was proved by the speech of the chairman of the United Motor Cab Company in London on Monday. He mentioned that the average earnings of the General Motor Cab Company by the taximeter in the first four weeks had been £2 1s. 3d. per cab per day; last week the average rose to £2 3s. per cab per day. Mr. Davison Dalziel says his company has ordered 500 motor-cabs for London, delivery of which will commence early next month, and by the end of the autumn the mechanical "growler" will prove a popular rival to the numerical strength of the London hansom.

Freedom of Choice.

THE output of cars at the leading British works continues to show no diminution; in fact, it grows every month and shows no sign of an early slackening. Judging from the number of entries in the Madrid exhibition, a goodly number of English firms are looking to other markets to take their production; they must also take care they do not close the opportunities of sale in their own country. Every chance of the sale of cars will have to be secured, and in view of the keen rivalry that is certain to come upon the trade before very long new firms in the industry will be well advised in keeping themselves from entangling engagements calculated to limit their choice of trading methods and means of publicity.

Lights on Vehicles.

CAPTAIN RENTON'S Lights on Vehicles Bill has just come before the Standing Committee on Law of the House of Commons, when it was discovered that considerable opposition to the measure had been received from Liverpool and Manchester and very little from the agricultural districts, which it was thought would have been the principal opponents to the proposed legislation. The Liverpool Dock Board and similar bodies had called the attention of the Government to the danger of fire in their warehouses in the event of the provisions of the Bill being stringently enforced; and Mr. George Harwood and Mr. Harmood Banner, representing northern constituencies, described the measure as a "monstrous interference" with business places like Liverpool and Manchester, and moved to omit from the obligation to carry lights on vehicles in all well-lighted areas, a proposal which, although finally rejected,

obtained a considerable measure of support. Ultimately Mr. Herbert Samuel agreed to meet the wishes of Liverpool opponents, with the result that the measure was carried a step further.

The Bedfordshire A.C.

STEADILY the number of county automobile organisations is increasing, and we are glad to hear of the steps being taken for the formation of an automobile club for Bedfordshire. A meeting will be held within the next few days, when the matter will be fully considered, the idea being to found a strong organisation to provide facilities for meetings of Bedfordshire motorists, fostering the interchange of ideas and experience, and discouraging any reckless and inconsiderate driving that may be reported, and generally to extend the influence of the movement in the county. Lord Amptill, Mr.

A Preposterous Proposition.

LORD BRASSEY, addressing the Burnley Chamber of Commerce in his capacity of President of the Associated Chamber of Commerce, announced a few days ago that further taxation on motor-cars would doubtless come next year, and that the annual charge of £10 for vehicles used for pleasure would not be thought excessive, nor would £5 for those employed for professional or business purposes be considered beyond the motorists' ability of payment. We do not know what authority his lordship has for this supposition, but can at once inform him that the amounts mentioned would inflict hardship upon the industry, and bring into opposition to the Chancellor of the Exchequer the fully organised forces of motorists throughout the country. It would be well if public men, when considering means of revenue, would pay some regard to the wider aspects of the question. The man who

The Brooklands Motor Track, Weybridge.—Laying the Asphalte.

Percy Barlow, M.P., Mr. Guy Pym, D.L., Mr. Howard Howard, Mr. Arthur Brown, of Luton, and other prominent motorists are interested in the new club, and Mr. Gregory J. M. Whyley, of Dame Alice Street, Bedford, is acting as hon. sec. *pro tem*.

Vapour Emission Competition.

THE Expert and Technical Committee has agreed to recommend to the committee of the Royal A.C. that the Vapour Emission Competition shall not be held in May, as originally suggested, but shall be postponed until the autumn, when it might be held in conjunction with a town motor carriage competition. The two competitions would, however, be quite separate. A further suggestion is that heavy vehicles shall, if possible, be allowed in the Vapour Emission Competition. The technical committee will shortly publish a statement as to the manner in which the Vapour Emission Competition will be conducted, with suggestions as to the best methods for preventing an excess of carbonic oxide gas being given off at the exhaust.

motors contributes considerably towards various industries without having to be taxed because he sees in a motor-car the means of economy in time and labour. Many subsidiary industries have benefited from the development of Motorism during the last ten years, and those engaged therein, in common with actual motorists, would deplore anything calculated to harass or impede the progress of an industry which, as our export returns have lately shown, promises to become a great factor in the commercial activity of the country.

Scottish Reliability Trial.

DURING the past week the Right Honourable Sir J. H. A. Macdonald, Lord Justice-Clerk of Scotland, President of the Club, drove Mr. R. J. Smith on his Daimler over about 500 miles of the trial route. The roads, which on the upper parts are now free from snow, were found to be generally in very fair order, and the secretary notes that there is a satisfactory advance in the condition of these roads evidenced from

year to year. The arrangements for the trial in outlying parts are now in an advanced stage, and considerable interest is being evinced throughout the route on the subject. The extension of the trial to five days, and the inclusion of Inverness in the itinerary, will lend new interest and give increased work to the competitors. Entries close on the 14th inst.

**The Six-Cylinder
Hotchkiss Tour
of
Great Britain.**

It is only a week or so since we chronicled the successful completion by M. Van Marcke of a 10,000 kilometre tour of France on a 45-h.p. six-cylinder Hotchkiss car. The identical vehicle has now been brought over to this country, and on Monday last started on a much more notable undertaking—a 10,000-mile trial in Great Britain under the observation of the Royal Automobile Club. From the map which has been prepared we find that in the course of its long journey the vehicle will visit all the principal towns, with the notable exception of Birmingham, in England and Scotland, from Land's End in the south to Inverness in the north, and from Yarmouth on the east coast to Holyhead on the west. The trial, during which the car will participate in the Irish and Scottish reliability competitions, is expected to last until

The Hotchkiss Six-cylinder Car Starting from the R.A.C. on its 10,000-mile Trial. (Argent Archer.)

July 13th, the daily distance averaging just under 140 miles. So far as possible the vehicle will be driven over different roads, only 2 per cent. of the running being over routes that have previously been traversed. Previous to the start, which took place from the Club house in Piccadilly, W., at 2.30 p.m., on Monday last, Capt. Corbet, of the London and Parisian Motor Company, entertained a number of friends to luncheon, among them being Mr. J. J. Mann, of the Hotchkiss Company, who explained the object of the trial. Our photo depicts the car leaving for Newark, the first day's destination, with Mr. C. P. Harrison, who will be the driver for the initial part of the trial, at the wheel. We may add that Mr. A. H. Binyon is acting as the observer on behalf of the R.A.C., and that the destination on Tuesday was Nottingham, a run to Burton and back to the lace city being made on Wednesday.

**Soldiers as
Motorists.**

WE understand that Mr. Haldane, as Secretary for War, has entered into an arrangement with the Technical College, Glasgow, for providing a series of demonstrations on the mechanism of motor-cars to the soldiers in Maryhill Garrison. This further recognition of the necessity of acquainting the military with a knowledge of motoring may be regarded as

going to prove the important part that mechanical vehicles will play in the operations of the Army in the future. From Portsmouth to Glasgow is a far cry, and the fact that at both extremities instruction in automobilism is being given under military auspices is gratifying to men like Lt.-Col. Mayhew and others who have urged, in season and out, the necessity of this country pioneering the movement in military motorism. Having provided a supply of drivers, Mr. Haldane will next have to make provision for the necessary vehicles for them to steer.

**A Motor Trade
Directory.**

THE new edition of the Motor and Cycle Trades Directory of Great Britain and Ireland, with which is incorporated Porter's Cycle and Motor Trades Directory, has just been issued by the Lancashire Publishing Company, Ltd., 10, South Street, Finsbury Pavement, E.C. This is now in its eleventh year, and there are nearly three thousand more names in this edition than in the previous issues. At the same time care has been taken to eliminate firms which have ceased their connection with the industry. There are two distinct divisions in the book, viz., geographical and trades, and apparently every endeavour has been made to secure accuracy, while the arrangement is well calculated to facilitate reference. In addition to the directory of the United Kingdom there is a Continental motor trades' section, which will be of considerable service to all engaged in the automobile business. The volume extends to over a thousand pages, and, compared with earlier editions, demonstrates in an emphatic manner the great growth of the motor industry. The Lancashire Publishing Company, Ltd., are to be congratulated upon their enterprise as well as upon the manner of its execution.

**Fun on an
Airship.**

"PUNCH" was at the Agricultural Hall, London, in the early days of April, for he refers to the aeroplanes at the Cordingley Motor Show, and secured an idea thereat. Now he proposes to hold an Aeroplane Competition in the vacant building plot between Aldwych and the Strand, his "Priceless Esteem" being offered as encouragement to the most successful inventor, and, probably—though he does not say so—to all the competitors generally. The suggested classification is as follows:—A, air skidders of not less than 1-goose power; B, Aeroboomerangs: to create hilarity by recoiling on the exhibitor's head; C, Turtleplanes: diffusing joy by flapping vigorously with their wings and flopping to the ground in an inverted position; D, Daisy-cutters: to raise a laugh by travelling along the surface among the L.C.C. brickbats in search of spring wild-flowers; E, Set-pieces: to please the junior members of the company by a firework display—will not be expected to budge from the starting-point. There will be, in addition, a miscellaneous class for models constructed of sardine tins and bits of newspaper and string, for giant tip-cats, for colossal grasshoppers, for man-lifting fleas, and for all other risible aids to aviation. Designers and inventors will accordingly please walk up—they are not called upon as yet to fly, but only to add to the gaiety of London.

AMONGST recent purchasers of Daimler cars is Lord Gerard, who has bought a 28-Daimler chassis of 10½-ft. wheelbase.

HIS GRACE THE DUKE OF SUTHERLAND, who last year acquired a 16-h.p. De Dietrich, has just ordered a 40-h.p. car of the same make from Messrs. Jarrott and Letts, Ltd.

MESSRS. WEST, LTD., have entered two cars for the forthcoming Tourist Trophy race which will comprise a number of special points. An Aster engine of 16–20-h.p. will supply the motive power, while the gear-box is being arranged to give four speeds and a reverse, with the direct drive not on the top but on the third speed. Wire road wheels of the Rudge-Whitworth detachable type are being fitted to the cars, which will have a wheel base of 9 ft. 6 in. and a track of 4 ft. 7½ in.

THE PROGRESS OF AUTOMOBILISM IN SOUTH AFRICA.

By C. R. BRADFORD, Hon. Secretary of the Natal Automobile Club.

THE motor-vehicle in South Africa, both for pleasure and commercial purposes, is at present only in its infancy, but to those acquainted with the industry it must be apparent that the next few years will see an enormous growth in the use of self-propelled vehicles. At the present time there are approximately between 200 and 300 cars in Cape Colony, between 600 and 700 in the Orange River Colony and the Transvaal, and about 150 in Natal. The majority of these machines are used for town purposes, only a very small proportion of them being kept in the country. The great drawback to the advance of the motor movement may be summed up under three heads:—(1) The roads outside the larger towns are, on the whole, in a very bad condition, no thought ever having been given to the proper construction and grading, and a large number of rivers which in the rainy season have a considerable body of water in them are unbridged and without ferry, and in some places only an apology

and to bring before the general public the enormous future in this land of vast distances of the mechanically-propelled vehicle, either steam or petrol.

As regards speed limit, we are fortunately not worried with restrictions other than in one or two of the larger towns, such as Capetown, Johannesburg, Bloemfontein and Durban, and even these restrictions have not, so far, been harshly imposed. The various town councils have, when approached, always taken a very lenient view of the matter, and have recognized the necessity of a fair margin being given, and that the automobile must needs be permitted an advantage over the horse vehicle as regards speed. The rough nature of the main roads of the colonies in itself acts as a speed regulator—long, straight, level surfaces are practically unknown, and in touring if an average speed of 16 to 20 miles per hour is maintained it is as much as can be expected from the best constructed car.

Garages are few and far between, barely half a dozen towns being able to boast of this luxury; Capetown, Johannesburg and Durban are fairly well supplied in this respect, but, in the majority of the other towns one is compelled to resort to the local cycle agent, whose knowledge of up-to-date cars is very meagre. The requirements of Durban motorists are met by two

Hemery on the De Luca-Daimler Car which he drove in the Targa Florio Race.

or a drift; (2) Until quite recently it was practically impossible to rely on a supply of petrol, and in making a tour any distance from the railway arrangements had to be made for forwarding supplies to different points *en route* by bullock wagon; (3) There is no car up to the present that has been built especially to suit the requirements of tourists in the South African colonies. Several long trips have been undertaken by one or two of the more enthusiastic motorists, and these experimental runs have been of great service in bringing to light the many defects from which both the European and American-built automobiles suffer, and have also dispelled the prevailing idea that South African roads, although rough, are impossible for motor traffic, either for pleasure or commercial purposes.

The trip from Capetown to Johannesburg has been accomplished on several occasions, both on European and American machines, from 6-h.p. upward. The run from Durban to Maritzburg, a distance of only sixty miles, which was considered quite a task owing to the bad surface of the road and its heavy grades, has now become a favourite trip for the more venture-some of our motorists, and has been accomplished by fully a dozen in the last few months in a little over three hours. There is not the slightest doubt that the formation of automobile clubs in the chief centres is doing a great deal to further the industry

companies, the South African Motor Company and the Natal Motor Garage, Ltd. New premises are in course of construction for these two companies, and arrangements are being made to equip them with a complete up-to-date repairing and charging plant. One of the most grievous mistakes made by manufacturers has been in granting sole agencies for the whole of South Africa to firms who have only a place of business in one town. These firms in turn appoint sub-agents, the purchaser consequently having to pay so large a price for his car by the time it reaches him that many are debarred from the pleasures of motoring, owing to this unbusinesslike arrangement. To this cause may be assigned the fact that a number of purchasers of cars have placed their orders direct through a buying house, either in Europe or America. Manufacturers would be wise before granting sole agencies to make inquiry regarding the district covered by firms requesting them, and, unless they have branches of their own business throughout South Africa, control should only be given in the district in which they are directly represented.

(To be concluded.)

THE Royal A.C. will treat thirty-one miles of the race track in the Isle of Man with Akonia dust preventor.

CONTINENTAL NOTES.

The Herkomer Touring Trophy Contest.

The entries for the 1907 contest for the Herkomer Touring Trophy have reached a total of no less than 176, of which the majority (108) are German vehicles. The foreign element forms quite a small proportion, the Italians being most largely represented with twenty-two entries, the French coming next with thirteen cars of various makes. The English contingent consists of two Napiers, two 45-h.p. six-cylinder Siddeleys, a Belsize, and a 40-h.p. Argyll entered by Mr. Robertson Grant, who, it will be remembered, drove a 16-20-h.p. Argyll in last year's contest.

A Danish Touring Car Trial.

The Danish Automobile Club is organising a trial of touring cars to be held on the island of Seeland on the 26th prox. The event is open to all fully-equipped touring cars belonging to members of the D.A.C. or any affiliated club; the total distance to be covered being 300 kilometres. Each vehicle will be allotted 300 marks, from which points will be deducted for all stoppages.

The Kaiser's Prize Race.

The Kaiser, in company with his brother Prince Henry of Prussia, last week went over the course on which the contest for the prize he has offered is to be held. It is reported that the

A View of the Course on which the Contest for the Kaiser's Prize will be held.—A right-angle turn at Oberursel.
(Allgemeine Automobil Zeitung.)

Government authorities will require one or two parts of the course to be neutralised, and also a restriction in the number of competitors.

A Hill Climbing Competition in Spain.

A hill climbing competition is to be held in Spain on May 22nd. It will take place at Puerto del Guadarrama, and classes will be provided for (1) two-seated cars up to 600 kilog.; (2) touring cars; (3) commercial vehicles for loads up to two tons, and (4) public service machines having accommodation for at least fourteen persons.

Motor-Cars for Military Purposes.

The French military authorities are devoting considerable attention to the utilisation of motor vehicles in time of war, and again last week called upon a number of automobilists on the reserve list to present their cars at Vincennes for inspection and trial. Sixty-two vehicles put in an appearance, and afterwards they were subjected to a stiff cross-country run, in which both the hill-climbing capabilities and the brakes were thoroughly tested.

An "Economical Wheel" Trial.

The Automobile Club de Seine-et-Oise is organising a trial of "economical wheels" for motor-cars—that is, some system

interposed between the axles and the road which shall serve as a less costly substitute for pneumatic tyres, while retaining the easy riding qualities of the latter. The cars to which the arrangements are fitted will be required to cover a distance of 3,500 kilometres, and the awards will have regard to the first cost of the wheels on a total weight—1,000 kilometre basis, and to the cost of up-keep. The five successful competitors will be eligible to continue the trial for a further 1,500 kilometres for the Mirand-Devos cup, which is being offered in connection with the event. Particulars of the trial, the entry list for which closes on the 6th inst., can be obtained from the Technical Commission of the A.C.S.O., 10, Avenue Debasseux, Versailles.

The Elastic Wheel Competition.

Of the thirteen cars which started in the trial of elastic and spring wheels from Paris to Nice and back, a total of 2,080 kilometres, eight succeeded in covering the whole distance; of these three vehicles were fitted with Ducasble tyres, three with Elastex tyres, one with Cosset spring wheels, and one with the E. L. wheels. The jury met on Friday last week to examine the condition of the wheels and tyres after the long journey, and have since made the following awards:—Class I., cars having engines of a total piston area of not more than 127 sq. centimetres, 1, Ducasble tyres fitted to an 8-h.p. De Dion; 2, Elastex tyres on an 8-h.p. Demeester. Class II., vehicles of maximum piston area of 347 sq. cm., 1, Elastex tyres on Motobloc car; 2, Cosset spring wheels on Panhard. Class III., cars of maximum piston area of 472 sq. cm., 1, Ducasble tyres on 24-h.p. De Dion, and 2, Elastex tyres on Cornilleau Ste. Beuve car. On Thursday the Elastex Company entertained their fellow competitors in the trial to a banquet, when a suggestion was made that makers of spring and elastic wheels and tyres should form a society with the idea of developing the use of the same on automobiles.

Miscellaneous Items.

A company has been formed in Prague, Austria, to introduce a service of motor-cabs into the town.—A motor-car exhibition was opened in Stockholm on Tuesday last, the 30th ult.—A motor-car race from Moscow to St. Petersburg, a distance of 425 miles, is to be held on the 7th prox.—The three German cars entered for the Grand Prix are not special racing cars, but ordinary standard Chainless cars, specially lightened, in view of the fact that they have only to carry a light racing instead of the usual touring body.—The French Minister of Finance has informed the Touring Club of France that in future no duty will be exacted from automobilists entering French territory for petrol contained, bona fide, in their reservoirs. This privilege extends only to the subjects of other nations who accord a similar favour to French citizens, such as England, Belgium, Switzerland, and Germany. Temporary permission to this effect had been already given during the past year, and the Minister of Finance has now made it a permanent rule.

THE Swift Company have entered two cars for the Irish Trials and two for the Scottish Trials. For the former they are sending their latest twin-cylinder vehicle, and a new production, an 18-24-h.p. model. Both cars are fitted with engines of the Swift Company's own design and manufacture. Of the machines for the Scottish Trials one is another entirely new model, 15-18-h.p. four-cylinder, and the other a twin-cylinder vehicle.

THE Master of the King's Household, the Right Hon. Lord Farquhar, has just taken delivery of a new 60-h.p. six-cylinder Napier limousine, on which he has started for a tour in Spain. The body of the car seats five in the interior—three on the main rear seat and two on additional seats—so arranged that they enable the passengers to face forward, and yet, when not required, they fold close against the sides of the body. A speaking-tube, folding tables, electric lights, and other refinements that make for utility and comfort, are also embodied in this luxuriously designed carriage. The interior is upholstered in green ribbed cloth, and the painting is in alternate stripes of dark green and black.

THERE are thirty-one entries for the International Tourist Trophy Race, and sixteen for the International Heavy Touring Car Race.

HIS ROYAL HIGHNESS THE DUKE LUDWIG OF BAVARIA has bought a Metallurgique car, which he intends to drive in the Herkomer Touring Trophy contest.

MR. HAMPTON, South Quay, Douglas, will supply competitors in the Manxland races with a petroleum spirit having a specific gravity of 0.715 to 0.725 at 60 deg. Fahr., as required by the Royal A.C.

MESSRS. W. J. PECKHAM, LTD., have a garage for sixty cars in the Osborne Road, Southsea, which is open by night as well as by day.

WE learn that the Fiat Company are building 500 motor-cabs for service in London. They will be of 12-h.p., and will be fitted with four-cylinder engines.

MESSRS. HALL, CAPRIS AND CO., LTD., inform us that the Isotta-Fraschini cars which competed in the Targa Florio contest last week were, so far as the chassis was concerned, standard patterns taken from stock. Their times were very uniform, only twelve minutes separating the three vehicles which finished the run of 450 kilometres, and which secured the seventh, ninth, and eleventh positions. In the first round of the course the fastest time was made by the vehicle driven by Trucco.

MESSRS. BRANSOM, KENT AND CO., LTD., have issued from 40, Great Eastern Street, E.C., a catalogue of tools and machinery required in the motor trade, which will doubtless be in good request from owners of garages throughout the country as well as from private motorists who see to things themselves. Braziers and forges, chucks, drilling machines, grinding tools, lathes, pipe bending tools, screwing machines, stocks and dies, &c., vulcanisers, &c., find illustration and description in this list.

A "NEW contract system" is being introduced by the Automobile Contract Company, Ltd., of 51, Conduit Street, W., who are willing to supply any reputable make of car on this plan. The customer selects the car, which is purchased by the Automobile Contract Company, by whom it is supplied to the client on hire with right of purchase. One third of the value is paid down, and the remainder can be settled at any time within twelve months. The hiring can be terminated within that period on terms which are fully explained in a new leaflet just issued by the company.

WE illustrate herewith a novel type of body of doctor's coupé recently designed and built by Mr. Wm. Vincent, of Reading. The idea of the design is to obtain the advantages of a limousine body with a side entrance, within the limits of a short chassis, which admits of a moderate-priced car being supplied. There is ample room for two adults in the back, and

Elevation and Plan of Chassis of West 20-22-h.p. Car, showing at A the new Shock-absorbing Device referred to in the last issue of the "M.C.J."

Two Daimler cars are entered by amateurs for the Frome's Hill Climb. The Daimler Company is not officially represented, and these cars are only of the 1906 pattern, which was so successful in hill climbing during the past season.

THE Bexhill magistrates have dealt with due severity with four lads who threw an orange at the car of a motorist, breaking the glass of his screen, and causing injury as well as annoyance. All such cases should be reported to the police.

THE chairman of the British Moss Litter Company, Ltd., has told his shareholders that the sales of moss litter last year were within £900 of the previous year—"thus showing that the motor industry has not materially affected the moss litter trade."

MR. R. TINGEY, of the Parade, Leamington Spa, sends a waistcoat-booklet relating to the Regent Hotel garage in that pleasant town. At the hotel a 20-h.p. car is kept for hire by visitors, and accommodation is provided in the garage for forty automobiles.

MR. C. R. BRADFORD, the hon. sec. of the Natal Automobile Club, has recently contributed a series of articles on "The Progress of Automobilmism in South Africa" to the "Horseless Age," some interesting extracts from which are reproduced elsewhere in the present issue.

THE Riley Cycle Co. inform us that in view of the demand for their different models, and especially for their 9-h.p. car, they looked forward to doing good business at the Cordingley Show, but they did even better than they expected. The 9-h.p. went well, but the other models, especially the 12-h.p., were in good demand, the volume of trade being better than at any previous show at which they had exhibited. They consider that the percentage of visitors really interested in cars was very high at Cordingley's.—"The Motor Trader."

with the door closed a good space for luggage is formed on the floor boards. The body is built of mahogany panels on ash framing and is upholstered in cloth, with wide and comfortable cushions and upholstery. There is, of course, no reason why this type should not be mounted on a larger chassis, but the primary object is, as mentioned above, to get a small limousine on a short wheel-base car.

MESSRS. S. F. EDGE and E. Powell have been giving evidence before the meeting of the departmental committee appointed by the Board of Trade to inquire and report with reference to the participation of this country in the great international exhibitions.

A BRANCH garage has been opened by Mr. John Hoyle, of Brighthouse, in Weymouth Street, Halifax.

JUDGE SIR WILLIAM SELFE has asked the conundrum, "Is a motor-omnibus a lady because it wears a bonnet?"

MESSRS. MOORE, of Brighton, Ltd., have taken a further block of property in Regency Mews, Brighton, for the extension of their garage.

THE Manchester Motor Garage Company, of Hardman Street, Deansgate, Manchester, has been appointed the official Motor House of the Manchester A.C.

THE Argyll Motor School in Newman Street, London, W., is proving increasingly popular and attracting a large number of people for whom situations are likely to be found, as well as private owners of cars.

The Complete Set of "Rapeasy" Tools for Mounting or Dismounting Tyres.
(See page 214.)

WE understand that both Mr. Frederic Coleman and Mr. Claud Johnson are having a preliminary run next week over the Scottish Reliability Trial course—under the official observation of the Royal A.C.—but their cars will not be in competition with each other in any way. Readers will, therefore, not confuse this event with the trial resulting from the White steam car challenge, and which will be held later.

THE Motoring Annual and Motorist's Year Book for 1907 comes to hand in its usual excellent form, extending to 500 pages, and forming an encyclopædia of the year's automobilism. In addition to the "Who's Who" of motoring, the section relating to clubs and motoring organisations is extending to great dimensions, and the editors are to be congratulated on the growth of the volume. Its earlier publication in the year is the only suggestion for improvement we would offer our confreres.

GOGGLES are to be supplied to the motormen employed on the tramway system of the Ilford District Council.

THE Motor Drivers' Employment Agency, 199, Piccadilly, W., has received an application from a lady who wants a situation as motor-driver.

AMONG last week's deliveries of engines from the Ailsa Craig Motor Company's Works at Chiswick was a 20-30-h.p. Ailsa Craig petrol motor for Messrs. John Wilesmith and Company's new hydroplane.

MR. H. GARNER, the well-known motor factor of Nantwich, is making a feature of the sale of Humber cars, giving clients a choice of styles and models from a large stock ready for delivery.

LORD JUSTICE ROMER has been a sportsman for the whole of his career, and is now quite as enthusiastic over motoring as he was over cricket and rowing in his younger days. His Lordship drives a 30-h.p. Beeston Humber.

THE first automobile built, about 1893-4, by the Haynes Automobile Company, of Kokomo, Ind., has been acquired by the Smithsonian Institution at Washington, U.S.A., in whose museum it will be kept as one of the first petrol motor-cars constructed in America.

MESSRS. BROWN AND HUGHES, of Netherwood Road, West Kensington Park, W., have sent us a sample of "Taylor's Oriental Veneering Cream," for which they have secured the British agency, and which will be found, as judged by the samples of work exhibited at the recent Cordingley Show, an excellent means of maintaining the polish of all the varnished portions of motor-car bodies.

FROM Messrs. Perry, Thornton, and Schreiber, Ltd., Long Acre, W.C., who have acquired the British agency for the Ford cars, comes a copy of the latest catalogue of these vehicles. Two models are made, viz., 15-h.p. four-cylinder and 40-h.p. six-cylinder, full particulars of which are given in the list. We may add that examples of both types are now on view at the firm's depot, where they may be inspected and tested.

MESSRS. JARROTT AND LETTS, LTD., have sent us an interesting photograph, which unfortunately does not lend itself to reproduction. We may state, however, that it depicts Herr Hegel, of Copenhagen, putting his 60-h.p. De Dietrich to a novel use during the heavy snows of the past winter—that of hauling a sleigh. Herr Hegel writes that he has had as many as twenty-five people on board the sleigh, and that he has easily attained a speed of 40 to 50 kilometres per hour. Non-skids are, of course, of no use in the snow, so big ropes were twined round the driving wheels, these being found to answer perfectly.

CALLING at the works at Alexandria the other morning to take delivery of a new 26-30-h.p. Argyll, Mr. Hamilton, of Argylls Liverpool, Ltd., accompanied by Mr. Charles McIver, the well-known yachtsman and member of the Royal Clyde Yacht Club, drove this car from Glasgow to Liverpool without a gear change, a distance of 214 miles, in good time, making an absolutely non-stop run. This run is particularly interesting in that it demonstrates the extreme effectiveness of the new throttle valve and control fitted to these cars, and by means of which any Argyll car can be driven at a speed varying from four miles an hour to forty on the top speed alone.

A NEW nut and bolt lock washer has been put before the motor industry by the Gripper Company, Ltd., of 2, Bream's Buildings, Chancery Lane, E.C. The principle of construction makes it impossible for the nut to slack back whether screwed down tightly on the work or not, while no strain is placed on the thread. In the centre of the washer is a D-shaped aperture for the bolt, three spring fingers being placed on the outer circumference. In the locking ring are teeth to engage and lock with the spring fingers in the washer, the aperture between being the shape of the nut, hexagon or square, with the sides slightly raised to prevent the rotation of the nut. When fitted it is impossible to move the nut, even with a spanner, without first removing the locking ring. The "Gripper" nut and bolt lock washer is especially adapted for the bolts on the engine and shaft bearings, and the device can be made of any metal, the principle of action not depending upon the adoption of any particular material.

SOME USEFUL NOTES.

ONE should always be on the look-out for "squeaks," for any such unusual noise is evidence of lack of lubrication and generally foretells a breakdown unless heeded at once.

IN taking down gears and other parts of the mechanism of a motor-car, care should be taken to see that all the parts are so marked that no mistake can be made when the re-assembling is done. Special precautions must be taken with the ignition and valve timing, as the least error in resetting these may be attended with disastrous results.

THERE is a cause of misfiring which is not usually discovered very quickly; in some cases there is an intermediate wheel between the exhaust and inlet and crank-shaft gear wheels, this being frequently made of fibre, and after considerable usage it wears very thin on the teeth, with the result that the timing is not at all accurate, and misfiring occurs at high speeds. By fitting a new wheel the trouble will vanish.

THE perfect curing or vulcanisation of a tyre repair is best tested by the thumb nail. Should the part vulcanised leave an impression after being indented by the thumb nail, it is a sure sign that it is under-cured or under-vulcanised, and should again be applied to the vulcaniser for a short time. On the other hand, as Messrs. Harvey, Frost and Co., Ltd., point out in their Instruction Book on tyre repairing, should it feel hard, brittle, and entirely irresponsive to the touch, it is a sign that it is over-cured, and this latter should at all costs be avoided, as it is at all times preferable to under-cure rather than over-cure. It should be quite possible to be able to impress the part which is vulcanised; at the same time it should be responsive and not in any way retain the impression made.

It frequently happens that when a motorist has run up to, and come to rest at a point at which he desires to stop, on top speed, a little difficulty will be found in returning the change-speed lever to the neutral notch in the quadrant or gate. This is due to the fact that the teeth of the toothed pinions on the sliding sleeve on the gear-box do not at the moment exactly coincide with the spaces between the toothed wheels on the gear-shaft, and the pinions will not pass each other. Of course, the clutch can be let in slightly, which would alter their position with regard to each other, but not infrequently the teeth still foul. The depression of the brake pedal, however, and the consequent grip of the brake bands on the drum, will, by reason of the slight play in the driving shaft, cause the gear shaft to move just enough to permit the passage of the wheels on the sliding sleeve through their fellows, and allow the neutral notch to be at once attained.

THE condition of the tyres is a matter about which motorists should frequently take notice. A deflated rear tyre, especially if there be much weight towards the rear of the car, often gives a peculiar "feel" to the steering, as if the vehicle were travelling over a greasy road. The rear of the car swings about abnormally, as if there were a slight skidding tendency. When a driver feels this sensation, when running on a good dry road, he should immediately think of his rear tyres. Of course, a deflated tyre causes unusually sharp jars to be transmitted to the portion of the car over it, and the mud-guard and other attachments in its vicinity shake and rattle more than usual when the wheel is running on its rim with the tyre deflated. These signs may, however, pass unnoticed when a car is proceeding at a moderate pace over perfect roads. A deflated front tyre will usually make itself known by the excessive jar which is transmitted to the car body, and by the difference in the steering which it causes. The car tends to swerve to the side upon which the injured tyre is located. Signs of tyre trouble should be instantly heeded, as there is not only the certainty of damaging the inner tube and cover beyond repair, but the danger of serious loss of control of the car if high speeds are indulged in.

THE SICO MOTOR TYRE INFLATOR.

WE illustrate a new tyre inflator designed to obviate the use of the ordinary pump and the hard work associated therewith, which has just been put on the market by the Scotch and Irish Oxygen Company, Ltd., of the Rosehill Works, Polmadie, Glasgow. As will be seen from the illustration, the arrangement consists of a neat wooden box in which are fitted two seamless steel cylinders containing carbonic acid gas (CO_2), and equipped with the necessary tubing, pressure gauge, &c. A spring safety valve is provided at E; this can be adjusted to blow off at any desired pressure, so that there is no risk of over-inflation and consequent damage to the tyres. Even without the safety valve, there need be no risk of over-inflation, as the gas can immediately be shut off when the proper pressure is recorded on the gauge, but the safety valve provides against possible defective working of the gauge or inattention of the operator. By means of a special fitting the tyre valve is kept open while the gas enters and the correct tyre pressure is recorded on the gauge. The cylinders are made of solid-drawn mild steel, in accordance with Board of Trade requirements, and are annealed and tested

to a pressure of 3,360 lbs. per square inch without permanent stretch. As the pressure of the gas in the cylinders (at say 85° Fahr.) is only about 1,100 lbs., it will be seen that there is a good margin of safety. The makers also inform us that no apprehension need be felt as to danger of explosion in the event of the cylinders receiving a shock or fall, as, on account of the special quality of steel from which they are made, they will stand a tremendous amount of hard usage without risk. The inflators are made in various sizes and in two capacities—1 and 2 lbs. of CO_2 —1 lb. of the gas, which is claimed to have no harmful effect on the rubber of the tyres, being sufficient to fully inflate an 870 by 90 mm. tyre five times. Arrangements are being made to supply fully charged cylinders for discharged ones promptly and at moderate rates.

FROM Messrs. Morgan and Co., Ltd., of Long Acre, W.C., who have just taken up the British agency for the Adler cars, comes a copy of the catalogue they have issued of these vehicles. This is one of the most complete booklets of the kind that we have so far received; it extends to sixty-two pages and comprises an elaborate description of all the principal details of the Adler cars, the text being elucidated by very clear drawings and photographs. As showing the exhaustive character of the work, it may be stated that there are altogether no less than thirty-two illustrations, the majority of these each occupying a full page.

The Cordingley Show.

(Concluded from page 193.)

PETROL VEHICLES

The Star Cars.

The exhibit of the STAR ENGINEERING COMPANY was one of much interest, not merely because of the 30-h.p. six-cylinder car that was on view, but also because of the improvements embodied in the older models. Dealing first with the "six," this is throughout on modern lines. The cylinders, which are cast in pairs, are $4\frac{1}{2}$ in. bore by 5 in. stroke. The engine is fitted with magneto ignition and the carburettor is of a special automatic type ensuring slow and quiet running; the lubrication is also automatic, and worked by a small plunger pump operated by an eccentric on the cam shaft; the supply of oil is drawn through a filter from a reservoir underneath the crank chamber, the pump forcing it through all the bearings, whence it returns through a filter to the reservoir. The gear is of the firm's usual type, giving three speeds and a reverse, with a direct drive on the top speed, the shafts in the gear-box being fitted with Hoffmann ball bearings. The transmission from the differential shaft to the road wheels is by side chains on to sprockets formed solid with the large internal brake drums on the rear wheels. Two foot brakes are also provided on the differential shaft. The frame is of pressed steel of

Fig. 67.—The Engine of the Star Six-Cylinder Car.

deep section. The throttle and ignition levers are fitted on the centre of the steering wheel, and there is also a foot accelerator. The cooling is by a gear-driven pump and a radiator of the honeycomb type. The next car was a standard 18-h.p. "Star" of the Tourist Trophy type, fitted with a side entrance double phaeton body. The engine comprises four cylinders, $4\frac{1}{2}$ in. bore by 5 in. stroke, fitted with high-tension magneto ignition. Four speeds forward and a reverse, with direct drive on the fourth, are provided, the change-speed lever working in a "gate." The gear-box is fitted with ball bearings, and is built on the same lines as that of the six-cylinder referred to above, the top portion being so arranged that it can be removed without disturbing any other portion or the gear shafts, or taking the box from the frame. An attractive side-entrance double phaeton of the 18-h.p. four-cylinder type was also on view; the cylinder dimensions in this case are $3\frac{1}{2}$ in. bore by 5 in. stroke. Motorists of moderate means looking for a four-cylinder car within their limits may inquire with advantage into the merits of the 10-h.p. car, of which a chassis, a side-entrance double phaeton, and a landaulet were shown. The cylinders are $3\frac{1}{2}$ in. bore by $4\frac{1}{2}$ in. stroke, the vehicle being fitted with mechanical lubrication, three speeds and reverse, with direct drive on top speed. This car is being supplied either with a side chain drive or with a live axle. The frame, which is of pressed steel, is

supported on long springs, ample length behind the dashboard being available for a roomy and comfortable body. In view of its relatively low price the Star Company are experiencing quite a brisk demand, or this model, on which the engine control levers are now mounted on the steering wheel. A 7-h.p. Star car was also to be seen at the stand. Among the changes which have been made in this popular model are a honeycomb radiator in place of the usual gilled type, an H section stamped steel front axle instead of the tubular one of last year, and push pedals for the clutch and brake. Reference should not be omitted to the display of parts of the 14-h.p. car supplied to the Royal Automobile Club about a year ago, the excellent performance of which was alluded to in a recent issue.

The Gracile and J.P. Cars.

The recently amalgamated concerns, the GRACILE MOTOR CAR COMPANY, LTD., and the J. P. MOTOR COMPANY, had a joint stand, on which some excellently finished cars were shown. Reference may first be made to a 24-30-h.p. Gracile. This is provided with a four-cylinder engine 110 mm. bore by 130 mm. stroke, with both high-tension magneto and accumulator ignition. The lubrication is maintained by a gear-driven oil pump which draws oil from a large sump in the engine base

Fig. 68.—The J.P. 18-24-h.p. Four-cylinder Car.

chamber, and forces it into a tank on the dashboard, from which it flows by gravity to the engine bearings. The clutch is of the leather-cone type, a universal joint being provided on the shaft which connects it with the ball-bearing gear-box. The latter is adapted to give four speeds and a reverse, with "gate" control, the final drive being by side chains. The rear springs, which are of three-quarter elliptic type, are of a special pattern, the lowest leaves being curled round at the ends, so as to form a shock damper. Of the J. P. cars two sizes were on view—10-12-h.p. two-cylinder and 18-24-h.p. four-cylinder, both being live-axle vehicles, which, while comprising no startling deviations from modern practice, appear to be of sound construction, while their moderate price should recommend them to many motorists. The 18-24-h.p. car (Fig 68) is provided with a Gnome four cylinder engine set in the fore part of a pressed steel frame. The valves are all mechanically actuated and the ignition is by high-tension magneto, and also by accumulators and coil, the latter being fitted as a reserve. The clutch is of the leather-faced cone type of large diameter. Three speeds and a reverse are provided, with direct drive on top speed through the cardan shaft and bevel gear to the live axle, the latter being of exceptionally strong construction. The weight of the car is carried by the sleeves, the drive to the road wheels being

through squares on the ends of the internal shafts. The vehicle is well sprung, a transverse spring at the rear supplementing the usual longitudinal ones. Ball bearings are provided throughout except on the engine.

The Avon Cars.

The AVON MOTOR MANUFACTURING COMPANY, of Keynsham, Bristol, who are devoting themselves to the manufacture of cars for the man of moderate means, showed the Avon two-seated trimobile, a three-wheel machine, the body of which is arranged so that the passengers can

Fig. 69.—The Avon 7-8-h.p. Light Car.

sit side by side instead of tandem fashion, as in the usual tri-car. The engine is a single-cylinder of 5½-6-h.p. with coil ignition and Longuemare carburettor. The motor is located under the seat and drives through a leather cone clutch, three speeds and reverse gear-box, and single chain to a live axle. Fig. 69 depicts the Avon light car; which is provided with a 7-8-h.p. single-cylinder motor, which, like the 5½-6-h.p., is fitted with a novel arrangement of governor. The latter is of the spring type, and is placed on the same shaft as the circulating pump, both being driven direct from the engine flywheel by a leather-faced friction wheel. The governor acts on the throttle of the carburettor through a lever, but hand control from the steering wheel is also available. The transmission is on the same lines as the tri-mobile, the gear giving three forward speeds and a reverse with a direct drive on the top. Of interest to tradespeople was the Avon 7-8-h.p. light delivery van; this is practically built on the same chassis as the vehicle illustrated, but is fitted with a special body divided into two separate receptacles, so that more than one class of goods can be carried. The Avon Company are also supplying their 5½-6-h.p. engines and gear-cases separately to tri-car and motor-boat builders, the former being furnished complete with water circulating pump, governor, exhaust valve lifter, &c., the excellent finish combined with moderate price rendering them well worthy of attention.

The Motor House.

A large stand was occupied by the MOTOR HOUSE, who took occasion to illustrate the business done in the Euston Road with regard to the sale of cars. A good collection of new vehicles was on view, fitted with various types of bodies, wind screens and hoods, &c. Among the cars shown was a 12-16-h.p. Peugeot with brougham body and a canopy extension over the driver's seat. Several other vehicles were on view, and the complete selection should do much to extend a knowledge of the ability of the Motor House to dispose of cars of any type.

Clarendon Motor Cycles.

The Clarendon motor-bicycles were shown by Messrs. HAMMON AND SMITH, LTD., who have built their machines with a view of overcoming vibration and jerkiness on the road, no matter at what speed the engine may be running. The machines shown were of 3-h.p., and visitors could not fail to notice the strength of the frame, the method of construction being such as to do away with all risk of a fracture of this vital part of the machine. The cylinder of the engine is cast in one piece and the radiating flanges are arranged to combine neatness in appearance with efficiency in results. The cylinder is 77 mm. by 81 mm. and fitted with mechanical inlet valve. Four bolts secure the attachment of the motor to the frame, support being also given by a loop tube in a vertical position. The Clarendon motor-bicycles certainly attracted much attention in that department of the Show.

Wooden Wheels.

A large display of wooden wheels for all classes of motor vehicles, including lorries and buses, was made by the AUTOMOBILE WHEEL COMPANY (1907, Ltd.), whose original twin-spoke artillery wheel has been specially designed to withstand severe side strains. The company

have good facilities at their works in Peckham to construct any types of wheels from designs prepared for them, and also undertake repairs of every description in connection with wheels.

Ignition Specialities.

The GLOBE AUTOMOBILE EXPORTERS, for whom Mr. J. H. Shaffir, of Coventry, is the English agent, had a large collection of motor accessories and ignition apparatus, included in the range of the latter being "Vestale" coils, sparking plugs, distributors, contact breakers, switches, &c. In The "Vestale" coil either two, three, four or six wooden-cased coils are provided, fitted either with the "Vestate" rapid trembler or with the J. Carpentier trembler as required. The coils are effectively separated from each other, the double thickness of the wood of each coil-case ensuring that no induction shall take place between one coil and another. If it becomes necessary to remove or adjust any of the coils, owing to the wear of the platinum, or from any other cause, the single screw which maintains the coil in its case in the coil-box is loosened, and the particular coil can be removed for examination or adjustment. The coil can be removed and replaced in a few moments. A complete selection of accessories was shown at this stand, which attracted considerable notice during the progress of the Exhibition.

The Logan Cars.

Two novel cars of American construction were shown by the LOGAN MOTOR CAR AGENCY, of Fenchurch House, E.C., one taking the form of a light delivery van for butchers or provision dealers' use, and the other a ten-seated char-a-banc suitable for use in conveying pleasure parties at seaside resorts. The vehicles as regards the chassis are identical, so that the following particulars may be taken as applying to both. The 10-h.p. engine comprises two horizontal opposed cylinders, 4½ in. bore by 4 in. stroke, set in the fore part of the frame, with its crank shaft at right angles to the axles. The engine is air-cooled, both externally and internally, this being effected by using an open crank case, allowing the air to pass in an out like a bellows at every stroke of the pistons, the explosion driving the hot air out and the return sucking the cool air in. The insides of the pistons are provided with radiating spikes to carry the heat of the pistons through the crank ends instead of making it necessary to conduct it through the cylinder walls. The outside radiation is secured by the mounting of copper flanges on the cylinder, each resting over the other in such a way that it insures a positive contact at all times. The valves are of the vertical type and all mechanically operated. The ignition is by coil and accumulators, while the lubrication is effected by a special form of mechanical oiler which is operated by the engine, and which forces the oil to the various bearings. The power of the engine is transmitted through a contracting band clutch to a sliding pinion type of change-speed gear giving two speeds and reverse, operated by one lever and so constructed as to give a direct drive on the top speed. From the gear-box the power is transmitted to

Fig. 70.—The Logan Delivery Van.

a short countershaft through a cardan shaft and bevel gear, the final drive being by a single chain to a live axle. Roller bearings with ball end thrusts are used on the various shafts. The body is supported on a specially-designed trussed frame carried on double elliptic springs both at the front and rear, an arrangement which is claimed to reduce vibration to a minimum, and to permit of the employment of Swinehart concave 3 in. solid rubber tyres. We understand that orders have been placed for several of the light char-a-bancs for a projected pleasure service in the Isle of Wight.

HEAVY STEAM VEHICLES.

The Robey Steam Wagon and Tractor.

Messrs. ROBEY AND CO., LTD., of Lincoln, made their debut at the Cordingley Shows with two excellently finished machines, a five-ton steam wagon and a tractor, some particulars of which are given below. The wagon (Fig. 71) which is suitable for loads of five tons and for hauling an additional two tons on a trailer, is fitted with a vertical boiler of the submerged fire tube type, having a welded firebox with an ordinary fire grate. The outer top casing of the boiler is enlarged for

Fig. 71.—Elevation and Plan of Robey Steam Wagon.

the purpose of securing increased water surface and steam space, and also with the object of enabling the top to be removed by breaking two bolted joints, when it is necessary to clean and scale the inside of the boiler. The engine, which is of the compound type, is fixed close up underneath the frame. The drive from the crankshaft to the axle is by gearing throughout, the accurate meshing of the driving pinion on the second motion shaft and the spur wheel on the axle being secured by a patent universal coupling and swivel. The engine work, gearing and hind axle are enclosed in a dust-proof and oil-tight casing, and run in an oil bath. The road wheels are built up with cast steel centres and spokes, on the outer ends of which are secured hard wood felloes. The tyres are of nickel steel, the inner periphery being bored out with a slight taper; into the tyres the centres, together with the wood felloes, are forced under a very heavy hydraulic pressure, the result being a very strong and almost entirely silent wheel. The tractor, which is built in accordance with the requirements of the Heavy Motor Car Order (1904), is provided with a locomotive type of boiler, so constructed that a large number of $1\frac{1}{2}$ -inch tubes can be employed. The engine is of the compound type, with cylinders $4\frac{1}{2}$ in. and $7\frac{1}{2}$ in., by 9 in. stroke. Link motion of the usual type is employed, and an auxiliary valve, to admit live steam to the low-pressure cylinder, is fitted. The tractor is supported on a patented system, which requires the use of only one laminated spring. A useful feature of this machine, which is provided with a driven feed-pump, injector, water lifter, slip winding drum, and thirty yards of steel wire rope, is that the gearing, road wheels, hind axle, &c., can be removed without driving a single key.

The Savage Steam Wagon.

The exhibit of Messrs. SAVAGE BROS., LTD., King's Lynn, comprised one of their latest type steam wagons, designed for loads of six tons and to haul a further four tons on a trailer, the machine being capable of taking this load up gradients of one in twelve. The boiler is of the water-tube type, the working pressure being 210 lbs. per square inch. The main feed pump, which is worked from the second motion shaft, has two suction valves, an auxiliary double acting steam feed pump of large capacity being also provided. The engine is of the compound type, with improved single eccentric valve gear, enclosed in one casing with the transmission gearing, the whole running in oil. The cylinders are $4\frac{1}{2}$ in. and $7\frac{1}{2}$ in. diameter respectively by 6 in. stroke, the normal speed being 450 revolutions per minute. All the moving parts are lubricated automatically by the splash, and all main bearings are fed with oil under pressure by a pump worked from the feed pump eccentric. The amount of oil delivered can be regulated by means of a cock on the side of the main casing. Two speeds are provided, the drive from the differential shaft to the road wheels being by extra strong roller chains. The main frame is of channel section steel, braced by five cross members. The rear axle is a solid steel forging of rectangular section, and the front one

of girder section steel, the wagon throughout being built on substantial lines.

The "Little Giant" Tractor.

Messrs. TASKER AND SONS, of the Waterloo Iron Works, Andover, who were among the first to take up the construction of tractors, exhibited one of their "Little Giant" B 2 type machines, fitted with a patent spring gear which allows perfect freedom to the axle to adapt itself to any inequalities of road surface, while the driving gear revolves on fixed centres and drives the axle through the medium of a floating ring. The boiler is well stayed throughout and built for a working pressure of 160 lb. per square inch. The cylinders of the compound engine are 5 in. and $7\frac{1}{2}$ in. diameter by 8 in. stroke. The travelling wheels are, front 3 ft. 4 in. diameter with 5 in. tyres and hind 4 ft. 6 in. diameter with 9 in. tyres, but can be made of any width to suit purchaser. A loose winding drum with forty yards of best steel wire rope is provided. The travelling speeds are six and three miles per hour, and the tractor will haul a load of five to eight tons, according to the road.

The "Sentinel" Steam Wagon.

There are many features of interest in the "Sentinel" six-ton steam wagon (ten tons with a trailer) exhibited by Messrs. ALLEY AND MACLELLAN, LTD., Glasgow, who are represented in London by Messrs. E. W. Rudd and Co., Page Street, Westminster. The outstanding feature of the vehicle is its simplicity, which enables a comparative novice to drive the wagon with ease, and to acquire a knowledge of its mechanism in a very short time. The boiler, which is built for a working pressure of 230 lbs. per square inch, has 61.3 square feet of heating surface and 3.6 square feet grate area. It is of the vertical type with cross water tubes, and centrally fired from the top. For cleaning purposes the fire box may be dropped through the outer shell without disturbing any connections on the latter. The water level is above the tube ends, and is such that the steepest gradients may be climbed without exposing the crown. The draught is regulated by a water ashpan controlled from the cab, and the fire grate is arranged to tilt on trunnions for clinking. A superheater sufficient to superheat the steam about 100 deg. F. is provided. The engine is of the horizontal type, having two cylinders $6\frac{1}{2}$ in. diameter by 10 in. stroke; it is secured to the frame in such a manner that any twisting of the latter due to uneven roads or loading cannot cause binding of the crank shaft bearings. At five miles per hour the engine makes only 174 revolutions per minute. The valve gear is similar in principle to that of a petrol engine, as a cam shaft passes underneath the cylinders and operates mushroom poppet valves, separate valves being used for admission and for exhaust, and, by moving the cam shaft axially, the cut off can be varied to give different degrees of expansion. The whole of the motion work and the cam shaft run in oil, in a dust-proof casing. The unusual dimensions of the engine have enabled the makers to dispense with a second-speed gear, as all varia-

Fig. 72.—The Sentinel Steam Wagon.

tions of power and speed can be obtained by the throttle valve. The latter again is quite novel, the main regulation of the steam being by a stop valve, for, on turning the handle at the top, the valve is raised off its seat, but the orifice through which the steam passes can be instantly closed by a foot lever. In practice the driver regulates the pace and power of the wagon by the hand stop valve, but any slow down or stoppage for traffic purposes is effected by depressing the

pedal without taking his hands off the steering wheel. The drive is transmitted from the crank shaft to the differential on the live back axle by an extra strong roller chain. The driving road wheels may be instantly locked together when necessary by engaging a pawl pivoted to the off-wheel hub, with a notched disc keyed to the axle. The road wheels are of the firm's patented cushioned adjustable form, and are such that should the tyres stretch or the felloes shrink they may be adjusted in a few minutes by means of the conical felloe rings. The centres are of cast steel, the felloes of oak, and the tyres of mild steel. The latter with their felloes may be bodily removed in a very short time and winter timber tyres substituted, or the tyres when worn out may be easily renewed. The front wheels are pivoted to the axle on the centre line of the wheel treads, and are turned in the pivots through a screw and lever gear operated by a large hand wheel. With this arrangement there is no tendency to turn when the wheel strikes an obstacle. The steering is operated by a screw and nut working in an oil bath. Throughout the wagon special material has been used, and great care exercised that the proportions are ample. The wagon on view in (Fig. 72) was a repeat order from Mr. John Smart, Royal Deeside Carrier, Aberdeen, and, as will be seen, is fitted with a flat lorry platform.

MISCELLANEOUS EXHIBITS.

Motor Body Work.

A splendid display of motor body work was made by Messrs. SAYERS AND CO., whose *debut* at the last show was regarded with much interest. Prominent on the stand was a limousine body, fitted to a 30-40-h.p. Fiat chassis. This was a duplicate in design and finish of a vehicle which Messrs. Sayers and Co. recently sent to India for the use of the Amir of Afghanistan during his tour. It also attained distinction in winning the Gold Cup presented by the Maharajah of Gooch for the best appearance car in the Bombay Motor Show. A grand limousine trimmed in granite cloth, a touring phaeton with special "Sayerico" double extension hood and storm curtains, and a limousine-landaulet

Fig. 73.—The "Sayerico" Hood.

were also exhibited. This latter makes a complete open or closed car without the necessity of removing the top, all parts being made to fold. In addition to their motor bodies Messrs. Sayers and Co. had a good display of accessories, such as wind screens and the ironmongery connected therewith. The "Sayerico" has become well known, and the collapsible ladder for reaching the top of covered vehicles in connection with the carriage of luggage was also shown. All the productions of the firm are characterised by grace of outline and general effect as well as by good sound principles of workmanship.

The Cowey Speed Indicator.

Specialities in the way of speed indicators and speed recorders were shown by the COWEY ENGINEERING COMPANY, LTD., whose accurate and reliable instruments have long had the confidence of the leading motorists in the country. The firm's patent speed indicator is a well-designed device with a drive—off one of the front wheels—composed of bevel gearing and a flexible chain, securing a sound mechanical and positive method of transmission. The indicator is steady and accurate under all conditions of vibration, and requires no attention, adjustment, or oiling. It may be described as being mainly composed of three essentials, viz., a heavy balance wheel, a spring, and a propelling device. The spring is connected up to the balance wheel by means of a small chain in such a manner that it tends continuously to draw the balance wheel in one direction (the direction of zero on the indicator), while the propelling device gives a series of intermittent impulses to the wheel which tend to draw it in the opposite direction. The faster the vehicle travels the more numerous will be the impulses given to the balance wheel by the propelling device, and the spring having more work to do in overcoming the effect of these impulses will be deflected and allow the balance wheel to be angularly displaced to a greater or less extent. The balance wheel in its turn operates the indicating pointer and moves it into a position which repre-

sents the speed at which the vehicle is travelling. By the adoption of this novel principle the indicator is enabled to do its work effectively under any conditions, and is also unaffected by frictional differences in the adjustment of its various parts. The indicating pointer is in consequence absolutely steady at all points of its dial, from five to sixty or 120 miles per hour as the case may be, and is entirely free from any quivering or shaking, no matter what speed the car is travelling at, or how great is the vibration. The Cowey recording speed indicator was also shown on this stand.

Motor-Car Accessories.

In the Arcade a comprehensive display of motor-car accessories, &c., was made by Messrs. J. C. LYELL AND COMPANY, LTD., whose specialities include several novelties for which they are prepared to appoint agents in different parts of the country. Among these is the "Ursus" non-skid, in which the usual rivet form of stud is replaced by a metal strip about one inch by a quarter of an inch, and firmly secured in the tread. The behaviour of this new form of non-skid will doubtless be watched with interest by motorists. The "Clair" silencer for motor-cars and motor-cycles was also on view, and distinguished by the absence of complicated parts, being a succession of chambers with outlets allowing of the complete suppression of noise without reducing the power of the motor. The escape of the gas is made direct, and there is no chamber where unconsumed gas can accumulate. Efficiency as well as simplicity secured for the "Clair" silencer first award in the trials of the Auto Club de France. Another novelty was the "Rearguard" safety device, which is actuated by a "Bowden" wire operated by a pedal or lever, so that when the driver intends to slow down or turn a corner the lid of the little apparatus is automatically raised, revealing the word "Stop" so warning any oncoming cyclist or driver as to possible danger. It can be so arranged that the disc is illuminated for night travelling. Messrs. Lyell and Co. also showed the "Vic" lamps, which are demountable in every part, and in which a steady light is secured by means of a valve which automatically regulates the generation of the gas. The "Suchanek" cartographie was to be found on this stand, and, as it is now being adapted to English purposes, it becomes a matter of considerable interest. This is a combination of a map, mileage recorder, chronograph, and alarm disc, so that the motorist has the map of the road constantly before him, with dangerous corners, steep hills, and—aided by a study of the *M.C.J.*—police traps marked in a very distinctive fashion. The route map unrolls itself mile by mile proportionately to the speed of the car, and the motorist can thus ascertain his exact location at any point of his journey. When the English road maps are complete we may make further reference to an ingenious device which should become familiar on our roads during the coming season. Motor jacks, charging batteries, plugs, voltmeters, &c., made up a very interesting display.

Electrical Specialities.

Messrs. HARRY W. COX, LTD., showed their ignition coils and also the C.M. accumulator. In the latter a special feature is made of the design of the grid securing the efficiency as well as the durability of the device. The bars of the grid being on either side allow the active material to form a complete block, and it is held in by the wedges which are situated at opposite angles of the cells. No part of the frame is in the compound, consequently the latter does not crack and fall out when the lead expands. The separators are placed in channels on either side of the plates. On the bottom of the two outside plates of the section are placed four feet, two on each side. Across these is fixed a bridge of celluloid. This serves a double purpose. It keeps the section well off the bottom of the cell, and at the same time holds it securely together and prevents the separators from moving. Messrs. H. W. Cox, Ltd., issue a capital catalogue, prefaced by some useful instructions for charging accumulators and containing descriptions of many interesting specialities.

Petrol and Lubricants.

The name of Messrs. CARLESS, CAPEL AND LEONARD is so well known to the motorist that its mention will conjure up visions of petrol as a fuel for motor-cars. In addition to the standard grades used in this country the firm showed samples of petrol especially suitable for tropical countries. They also had on view samples of various oils suitable for lighting or fuel purposes, and they made a large display of lubricating oils, particularly of those specially prepared for motor-car service. The special Carline lubricating oil is suitable for motors of moderate h.p. and for the bearings and cylinders another lubricating oil has been introduced. Lubricating grease, graphite greases, "S" lubricating oil made up a representative collection of lubricants. The patent Benzine safety lamp shown at the 1906 Show was also on view. This should be adopted in all garages where it is desired to reduce the fire risks to a minimum.

Motor Oils, &c.

Messrs. GRINDLEY AND CO. showed a collection of their motor oils and greases similar to those they have supplied to the leading motor-omnibus companies of London. These are of excellent purity and specially prepared in various grades for different parts of automobiles. They are distinguished as the "Pioneer" brand, and special attention may be directed to the oils for the lubrication of motor cylinders and bearings which Messrs. Grindley and Co. guarantee to retain their lubricating properties at high temperature. Graphite grease, white solidified oils and other preparations completed an essentially utilitarian display.

Motor Components.

Messrs. FRANK MORRIS, LTD., of the Commercial Motor Works, King's Lynn, were well to the front with a good display of their various useful components for motor builders and repairers, and especially to owners of Daimler, Panhard, and commercial vehicles generally. For ten years past this firm have made a feature of supplying component parts for the building of a complete car, or spare or renewal parts for owners and users generally at a reasonable figure. The various specialities exhibited include the well-known "Morris" gear sleeve, with detachable first, second, third and fourth speeds all most easily renewable, for Daimler, Panhard and Panhard-type cars. Samples of old sleeves converted and fitted with the "Morris" renewable speeds were also shown. Other exhibits included motor gearing of all kinds, cylinders for increasing the power of old pattern engines, together with a special cam gear set for converting old-type automatic-valve engines into m.o.v. A combined ball-bearing and spring drive clutch for all types of commercial and touring cars, whereby all shock of starting is eliminated on the gearing and shafts, was also displayed, as well as differential ball-bearing thrusts for old Daimler and Panhard type cars, &c. The commercial section of Messrs. Morris' exhibit also included two useful types of two and four-cylinder engines having a bore of 110 mm. by 150 mm. stroke, every working part being contained on the motor itself, enabling it to be dropped into position and coupled direct to the clutch with a minimum of trouble. Other parts included wheel steering sets fitted with hand and foot accelerator gear, wheel and countershaft brakes, radius rods with internal rubber buffer for absorbing shock of stopping and starting, and a well-designed, strong and efficient type of aluminium radiator suitable for omnibus or lorry work and for pleasure cars.

The "Rapeasy" Tyre Lever.

From the way in which Messrs. PATTERSON'S ENGINEERING AND MOTOR CAR WORKS received orders as well as inquiries for their "Rapeasy" tyre lever it would appear that they have an invention of attractiveness to the motorist who has experience of the road. The labour of mounting and dismounting motor tyres is no light undertaking, especially to novices, and it is to facilitate this work that the company have introduced the tyre lever illustrated on page 208. In fact with the aid of such a tool a lady may mount a tyre without any great effort. Easy of manipulation, it is also simple and safe, while the operations on the stand during the Show proved that no strength was required to effect the purpose. Without the aid of the other illustrations with which Patterson's Engineering Works embellish their catalogue it is difficult to set forth the method of working the lever. It may be pointed out, however, that there is no danger of nipping the inner tube or distorting the bead, while the largest tyres can be mounted or dismounted in a minimum of time. The firm also had on view a new detachable rim flange—a simple and reliable arrangement in which the bolts and nuts are dispensed with. This is done by the provision of beaded studs in the felloe of the wheel which pass through wedge slots in the flange. A twist of the latter and a swing bolt locks the flange in position.

Welded Tanks.

There is no need to dwell upon the importance of securing the proper construction of tanks, barrels and other containers of inflammable spirit. This is recognised by all familiar with motor work, and has been taken advantage of by the STEEL BARREL COMPANY, LTD., to recommend the petrol tanks made with the help of their system of electric welding. By this means leakage is prevented, while the strength of the joints, which in other types meet, is immeasurably strengthened, for in this case the edges of the adjacent sides are welded to become integral with each other. The advantages of welded steel tanks are, that the joints are permanent and durable and not subject to cracking and leakage. Many motor-buses, cars, &c., have been damaged in consequence of leaky tanks, in which the solder or brazing has given way through the results of vibration, which might have been prevented by the adoption of tanks made by the Steel Barrel Company, Ltd.

The Vivian Non-Skid.

The Vivian Non-skid tyre was shown by the company of that name, and it is interesting as marking a new departure in connection with devices to withstand skidding. In place of the usual band and studs the tyre is constructed of alternate layers of dark and light rubber, which vary in resiliency as the tyre revolves and reaches the point of resistance at the ground. The light portion of the rubber takes such a form against the darker sections that it is said to provide a fulcrum preventing dragging and actually assisting the speed of the vehicle to which it is fitted. It is said that the Vivian Non-skid tyre throws less dust than ordinary tyres, and certainly it has an advantage so far as appearance is concerned. We hope to have opportunity for personal experience of this non-skid before long.

Chrome Leathers.

Time was when it was assumed that the only chrome leather suitable for non-skids was that obtained from France; now such a view has been changed by the enterprise of firms like Messrs. WM. WALKER AND SONS, LTD., an examination of whose exhibit proved useful to all interested in leather work. Here was to be found a selection of chrome butts specially prepared for non-skid bands both vulcanised and detachable. These are characterised by suppleness, lightness in specific weight and freedom from stretch; they are made in three grades, viz., with a firm finish to take the rivets or studs of the treads, a mellow finish for the outer covers, which are shaped and vulcanised to the tyre, and with a

thin mellow finish for the inner strips which are fitted to protect the tyre from being chafed by the backs of the studs or rivets. In addition to chrome leather Messrs. WALKER AND SON had a show of clutch leathers and machine belts. Supplementary to the ordinary degreased leathers the firm are making a speciality of clutch leathers cut from curried or greased, the employment of which renders unnecessary the use of any lubricant or dressing.

Motor-Car Accessories.

Messrs. MONNET, PLASSE AND CO., who are the sole agents in this country for Messrs. Mestre and Blatge, had a comprehensive display of accessories, including lamps, horns, watches, speedometers, plugs, coils, &c. On their stand we noticed a good selection of jacks, notable among these being the new "Universal" type. Spare parts for De Dion, Panhard, Darracq and Clement cars were also shown on the stand.

The Autoclipse.

Messrs. GEORGE W. HOUK, LTD., made a bold show of their Autoclipse motor lamps, which have previously been described in our columns. These lamps give a powerful light, and with the prompt aid of a small disc, the glaring effect on the road can be suppressed by the driver with the help of a Bowden wire from the dashboard. The "Accurate" speedometers were also shown, as well as the brackets, &c., for the lamp, which certainly secures a desirable result in a very reliable way.

A New Radiator Fan.

A new design of air-inducing fan for use in conjunction with the radiators of petrol cars was displayed by the ELECTRIC AND ORDNANCE ACCESSORIES COMPANY, LTD., Aston, Birmingham, who claim it to be capable of performing double the duty of the ordinary pattern. Other exhibits on view included flexible wire shafting, a spherical toggle joint for shafts and a direct tubular-spoked voiturette road wheel. In the latter the spokes are threaded directly into sleeve bosses of a cast metal hub, the outer or rim end being internally threaded and locked to the rim by a snap-headed screw.

Name Plates.

Excellent work was shown by the STANDARD METAL ENGRAVING COMPANY, who make a speciality of name plates for cars in metal and ivory. These can be left with the natural polished metal finish or relieved with colours so as to render them an artistic plate for dashboard plates, step plates, axle cap plates, &c. Special mention may be made of the company's radiator plates, on which the name of the car can be executed or any distinctive design facilitating the identification of the vehicle to which they are affixed. Already many of the leading cars are supplied with such plates by the Standard Company, which has lately removed to larger premises in Buchanan Buildings, 24, Holborn, E.C. The company do not limit their work to the automobile industries, but make name plates and dials for any branch of the engineering industry.

Clothing.

Messrs. H. J. NICOLL AND CO., LTD., had some very fashionable garments for lady motorists in rainproof frieze, rainproof twill, and other cloths that secure warmth without the great weight associated with early efforts to cater for fair motorists. These coats can be lined with leather, fur or camel hair, and present an appearance which should at once secure the appreciation of all who travel by car. Equally good praise may be bestowed on the garments for gentlemen. A speciality of liveries for chauffeurs is made by Messrs. Nicoll and Co., Ltd.

Miscellaneous displays were made by Messrs. RICHARD JAMES and Co., whose polishes and creams have each their recognised place among such goods; the Tella Camera Company, whose operators were in attendance for photographic purposes; the West End Motor Car Packing Company, who were giving particulars of their plans for packing and shipping cars and heavy vehicles; Messrs. J. and E. MARX, whose "Garlio" cloths for cleaning and polishing motor-cars are as well known as their stencil plates for numbering registered cars, &c., and Messrs. BROWN and HUGHES with Taylor's Oriental veneering cream for preserving and brightening the bodywork of motor-cars. Mention may also be made of the typewriting office established by Miss G. SAUNDERS at Stand 213, where typewriting and shorthand work was satisfactorily performed for exhibitors throughout the week. Messrs. ROYCE, BARNES and Co. had also a display of a capital soap for cleansing dirty hands. Messrs. DARRELL AND Co. showed, for the first time, Darrell's Dirt Defier—an excellent preparation for removing dirt from the hands with cold water. At this stand also M. Rene Kreher, the London agent for M. F. Champagne, of Paris, showed accumulator and tool boxes. The latter are of handsome appearance, and have been specially designed to fit on foot boards. The compartments are well arranged, and the whole idea is well thought out and executed.

MESSRS. REO MOTORS, LTD., inform us that over 100 tons of Reo chassis are, at the present moment, on the high seas bound for London, by the Atlantic Transport line. At the recent exhibition at the Agricultural Hall twenty-eight complete Reo cars of the two types, 10-h.p. and 18-h.p., were sold to private buyers, whilst agents from all parts of the country vied with each other in fixing up contracts for exclusive agencies for their various districts—an excellent testimony of the way these vehicles are rapidly gaining popularity in this country.

CORRESPONDENCE

[Letters to the Editor should be addressed to the offices,
27-33, Charing Cross Road, W.C.]

SOME NOTES OF AN EASTER TOUR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—“Have you had a breakdown?” the perversity with which people will ply you with this question, should one make a stop on the road, is really astonishing. I had a bit of bother on the outward run on Good Friday through one of the cylinders misfiring, and during the ten minutes’ stop made in remedying the trouble I believe the same question was addressed about a dozen times. Late in the evening we had another stop on the road, as the acetylene headlamp refused to work, and whilst investigating the cause the same thing occurred. First a passing pedestrian plied us with the question, then someone in a passing trap. After a few minutes’ interval a couple of lovers loomed out of the

along the Front, but still it did not prevent those irrepressible boatmen from asking us if we wanted a “Boat out, sir.”

Speaking of boatmen, it has always been one of life’s mysteries to me how the boatmen at the average sea-side resort get a living. At Deal and other places I have seen them on the Parade. They sit on a box and sleep for the most part of the day, only waking up at meal and beer times or at intervals to chivvy small boys off their boats. On Bank Holidays, and for about four weeks of the busiest time of the year, they may make a few shillings, all the rest of the year they sleep or look through telescopes at ships at sea, or watch the tide coming in and going out. And all the winter—what do they do in the winter? I give it up.

We left Deal by the coast road that leads through Sandwich to Margate and Ramsgate, and that is evidently a favourite one with touring motorists, judging by the number of cars that were to be seen. At the toll bridge at Sandwich there is a 1s. toll to pay on a car before one can proceed, and the toll-keeper makes an entry of the number of the car in a book as a receipt. As it can only be avoided by a circuitous inland route, it is evident that considerable revenue is derived from this source. From Sandwich to Pegwell Bay is a dead level and practically straight stretch of road of about four miles and of a surface equal to the finest bit of French road. It would form an ideal course for a kilometre or mile speed test.

The Scene at the Start of the Targa Florio Race.

gloaming, coming to a stop in front of the car. For a few seconds they regarded the car and ourselves in silence. Then the swain addressed us in this way: “Have you had a b—.” The sentence was not finished. I thought my friend who was assisting me in the operation was going to brain him on the spot. Instead he let forth “No, you —.” “Can’t you see we’re doing this for fun?”

In company with a great many other motorists I stopped at Folkestone on the opening holiday night. There is a very select and fashionable air about Folkestone which is rather freezing. Perhaps this is because there are no shops along the front,—beg pardon, Lees—but only swell hotels and private houses. It is one of the few remaining seaside places where the electric tram has not penetrated. Instead, there is a fine and evidently popular service of motor brakes, that run to Hythe and elsewhere, which service they say is going to be considerably extended this year. We tried about a dozen hotels in vain before we could get accommodation, and even then had to pay Savoy price. The following afternoon we looked in at Deal, an interesting old place, reached by capital roads, and with its golf links amongst the finest in the country, is yearly becoming more popular with motorists. The most surprising thing about Deal is the number of public-houses adorned with some seafaring sign, such as the “Deal Lugger,” “The Ship and Anchor,” “The Deal Smuggler,” &c. The afternoon we were there there was a bit of a sea fog on. We had to feel our way through this

The Isle of Thanet is a perfect maze of roads. One can approach Margate and Ramsgate, for instance, by about twenty different roads, and near Pegwell Bay we struck a curiosity in signboards, each arm pointing in an opposite direction to Ramsgate. We took the left hand road and presently struck a veritable maze of roads and cross-roads. After a few miles, during which we lost sight of the sea altogether, we enquired of a native if we were on the right road for Ramsgate, which met with the reply that we were heading for Canterbury, but if we took the second on the right and third on the left we should strike the Ramsgate road. We followed the advice and ran into a blind road that led into a cowshed. However, we reached Ramsgate at length by the hideous tramway road, which, with its poles and overhead wires, is a distinct eyesore. The trams run down a very stiff hill to the harbour, there being an acute bend at the foot, so that in the event of a runaway tram nothing could possibly stop it running off the rails and going clean into the harbour and eight or nine feet of water. For one thing, I note they do not souse the rails with water on this stiff drop. Ramsgate was a trifle slack in the matter of amusements, the chief attraction being a fine band on the east cliff. After putting the car up and contracting at an hotel, we had dinner, after which we started for a stroll round the town. From the old harbour jetty, with its huge landing stage at the end, where thousands of Londoners are transported by the steamers every day in the summer, one gets a most romantic view of

the town, with its lights gleaming and shining in the dark waters of the harbour. Facing you is the old stone pier marching out into the Channel, the old stone soldier that has braved a thousand seas. The sun always sets behind the cliff, throwing the town into a deep rich purple shade dotted and sprinkled with light, yellow, green and crimson. Across the water came the long-drawn-out melancholy ho-oo-oot of the siren of the Goodwin Sands. Amongst the boats moored in the harbour was a trim little petrol launch, evidently a sea goer.

We left Ramsgate long before the holiday trippers had arrived, but not before the "Mirror" and "Chronicle" motor-vans, that had made the journey down early in the morning, and in such good time, too, that the two papers were on sale considerably before any others. The homeward run lay through Margate and the mostly level road to Canterbury, that was in excellent trim. At Canterbury we left the direct road and were soon travelling over a most picturesque road that led past Chilham and Chartham into Charing, which is entered by a stiffish hill with an acute bend at the foot. We arrived at Maidstone shortly before one o'clock, and sat down, with four or five others, to a midday meal of roast beef and—have you ever tasted it—pudding pie. Kentish folk are proud of pudding pie, which is a speciality of the county. It is a Lenten dish, though why this is so, and what connection pudding pie has with fasting, I cannot tell you, and I don't think that many born and bred natives could either. What I can tell you is what pudding pie is like. It is something like a milk-pudding, something like an open tart, and something like a cheesecake, and something like a custard, and if this description is not enough to make you have the taste of pudding pie in your mouth, it should be. Anyhow, we ate that pudding pie and were careful to explain how much we enjoyed it. We should have eaten a dish of hot cross buns for dinner rather than let a single word of disapproval make us appear ungrateful for the genuine hospitality, excellent

The 28-43-h.p. Daimler Car recently delivered to Sir Owen Scourfield. The coachwork is painted crimson lake, with fine red lines and upholstery to match.

fare, and most reasonable tariff, we obtained from the hands of mine host at that Maidstone hotel.

After Maidstone the traffic increased and the roads became most loose and dusty, though the going was excellent. At Riverhead the Hastings road was joined, and careful driving was necessary the rest of the way owing to the number of brakes and wagonettes, the usual accompaniment of Bank holiday on the Sevenoaks road. We reached home well before lighting up time, dusty, but sunburnt, after a most enjoyable Easter holiday.—Yours truly,

C. M. F.

COMPARATIVE IGNITION TESTS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. S. F. Edge's tests in regard to the value of ignition flame, and relative h.p., are not only interesting but instructive, as they tend to overthrow some of the apparent values, given no doubt in all good faith, still in opposition to reasonable expectation. Personally, I know that a hot flame is an easy starter, but given the hot flame as a start from a magneto, under low starting conditions, the usual working speed gives a more intense spark of an unnecessary magnitude, resulting in an excessively hot cylinder and burnt-up lubrication. As Mr. Edge remarks, given a correct flame spark, no further power is gained by increasing it. A red hot poker will not inflame petrol, neither will an electric spark fire it, if generated within the body of the substance, whilst a flick of red dust from a cigarette end will do the trick. Just enough spark power is required to pierce a dense gas, sufficient to heat a local amount to attain the critical volume of vapour which will fire, even as a piece of paper held under a weight will not inflame until the pressure is relieved, the heating of a portion of a substance locally expands it, and as it seems props asunder the pressure, releasing

or rather relieving the combustible of the superincumbent weight, whereby the condition is attained for firing it. It is quite obvious that a given amount of heat is required in any one substance, neither more nor less, and when this is obtained any increase of flame or sparking power is wasted energy. The accumulator system gives one power spark for all speeds under one compression condition; the high-tension magneto gives one spark at low or starting speed, and a different spark for every increase of speed. Therefore, as the spark for the start is ample, then any increase of spark power is wasted and useless. The chief and main advantage of magneto ignition is its constancy; whilst the magneto and its power is intact, which it may be for years, then sparking is a certainty, whereas the accumulator declines from a best point to a useless one within given periods, and therefore needs recharging; but any contention that more horse-power is got from the spark from one system, as against the spark from another, is tantamount to saying that the spark adds to combustible value, which is nonsense, under the one restriction that the spark acts to fire, and when the substance is fired it is done, and nothing can increase it. Another point must be borne in mind, viz., that the engine supplies the power for the magneto, and whatever its efficiency, mechanical, it can never exceed 100 per cent., but is very likely 90 per cent.; therefore of the power given to produce the spark at least 10 per cent. is lost, whereas with the accumulator and coil the power to produce the spark is outside of engine effort, and consequently so much power is saved to the engine. And on the supposition that the magneto supplies sufficient spark at a very low speed to do the work, then as the power to drive at higher speeds increases, roughly as the square root of the difference, then the power lost is in proportion, and this is only given to form some relative proportion for asserting fact.

Now, saving in power is not everything, whilst expediency and convenience is a necessary measure of efficiency. Further, Mr. S. F. Edge's figures are interesting because they show a horse-power for the Napier engine which accounts for that motor's performance, and this, in itself, is an instructive item, testifying to the uselessness of dogmatic formula, that leaves out a floating and very varying power factor in regard to handicapping power probabilities.—Yours truly,

JOHN BATEY.

THE DAIMLER ACTION.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—As the effect of the decision of the Court of Appeal given on the 15th ult. in the case of the Daimler Motor Company 1904, Ltd., and the London Daimler Company, Ltd., seems from the reports thereof which have appeared in some of the weekly motor papers, including your issue of the 20th ult., to have been misunderstood, I am requested by my clients to point out that the injunction granted by that court in no way affected the main issue on which my clients successfully contested the action in the court below, viz., that the defendants are entitled to use the word "Daimler" both in their title, and as applied to cars built or sold by them under their licence rights, so long as they use it in such a way as not to be likely to cause confusion with the plaintiff company.

The plaintiffs, in fact, in the course of the proceedings, expressly abandoned their wider claim to restrain the defendants from using the word "Daimler" at all, and the injunction granted by the Court of Appeal was only on the minor point, viz., against the use of the particular name "London Daimler" or any other name not sufficiently distinguishable from that of the plaintiffs.

I shall be obliged if you will publish this in your next issue.—Yours truly,

WILLIAM J. HUNTER.

Solicitor for the defence.

THE COST OF CARS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—There has been a considerable amount of correspondence in the motor Press recently on the comparative price per horse-power of various makes of cars. In this connection it appears to me extraordinary that so many of those who are interested in the sale of cars at once hasten to point out that those makes they sell are, at any rate, among the low-priced ones. Now, all this appears to me to be leading in quite the wrong direction. It is to my mind a significant fact that while most of the English firms are making every effort to hold out the inducement of low price to would-be buyers, foreign firms of the best standing prefer to employ the very finest materials and workmanship and charge for them proportionately. And, what is equally significant, the firms who make these high-class, and, therefore, proportionately (although not actually) high-priced, cars are selling more cars than ever before. As an example take the Westinghouse. While this car works out at a fairly high price per horse-power, I do not think there is anyone with real engineering knowledge and practical motoring experience who will not agree that—considering the high-class workmanship and the great care taken in the making—the price of the car is in any way inflated. This, at all events, was the opinion of those who saw the Westinghouse chassis at the recent Cordingley Show.

One of your most prominent advertisers, who makes a very high-class and expensive car, in his advertisement a short time ago compared his car to a thoroughbred and the cheap cars to a cart horse. This is undoubtedly the right way to look at the matter, and it is a great pity that

an attempt should be made to persuade people that the really high class of motor-car can be built cheaply. It is surely no more reasonable to suppose that a cheap car will be as good as a more expensive one, than that a cheap pair of boots will be as good as a higher priced and better made article.—Yours truly,

G. P. H. DE FREVILLE.

STARTING THE ENGINE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a regular reader of your valuable journal, I should like to have your opinion, or any of your readers, as regards starting the engine of a car with a live axle, by getting the car away on the face of a hill, then letting in the clutch instead of starting in the usual way. Do you think this method is detrimental to the gears?—Yours truly,

T. R.

[The method of starting the engine by letting in the clutch when the car is in motion is not one that can be commended to form a habit of, as not only the gears but the crankshaft of the engine may easily be strained if the operation is not performed skilfully. The car should be put in its top gear, the ignition retarded, and the throttle as far closed as the engine will just run at. The clutch should next be withdrawn and then the side brake released, and as soon as the car has gathered sufficient way down the incline, the clutch can be let in very carefully, taking care to release it promptly if there is any "snatching," before the speed of the engine and gears synchronise. Provided that sufficient skill is exercised no harm whatever need result. On some cars it can be done so sweetly that not the slightest snatch can be noticed.]

RE ENDORSEMENTS AND RENEWALS OF LICENCES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a question of vital interest to all concerned in motoring, I venture to ask you to be good enough to accord the following space in your valuable columns. I was recently fined quite a nominal sum, viz., 6s. 6d. and 4s. costs, for driving a car on the footpath (in order to avoid 36 yards of unrolled metal), my licence being endorsed also. A few days afterwards—my licence having nearly expired—I duly applied for renewal of same, quoting the exact words constituting the endorsement; now, instead of copying this exactly as it stood, on the back of my renewal, I found that they had added the alternative, "In distress seven days' hard labour." As nothing of the kind had either been mentioned at the court or entered in the endorsement, I wrote protesting, and claimed that I had the right to demand that nothing other than that already framed in the original endorsement should appear on the renewal. In reply to this I was informed that the term "H.L."—meaning hard labour—should have read "imprisonment," with a request that I should return it for correction. Now the question arises, have the authorities the right to add anything whatever to one's existing endorsement?

I trust you will pardon the length of this letter, but as it appears to me to be a matter of some importance to all motorists, I shall be glad to have some opinion.—Yours truly,

ALDER.

[The point raised by our correspondent seems to indicate an excess of zeal on the part of the person making out the renewal or licence. In the sixth Schedule of the Motor Car Regulation and Licensing Order, 1903, the note is appended, "Particulars of any endorsement of any licence previously held by the person licenced must be entered on the back of this licence." That is specific enough, and the authorities should be content with merely copying the endorsement on the old licence without such addition as that which has been made in the above case. Motorists who have had similar experiences as our correspondent are invited to acquaint us of the facts, as the matter is one upon which authoritative opinion would be useful.]

A TYRE TRIAL.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the Petrol v. Steam controversy which is at present exercising the minds of many motorists, I make the following suggestion, which I hope you will consider of sufficient interest for insertion in your columns.

Mr. Claude Johnson has undertaken to match a Rolls-Royce against Mr. Coleman's White steam car.

This is too good an opportunity for a tyre trial to be lost, and I offer to match Moseley detachable tyres against Michelin, Continental, or Dunlop tyres. I would provide detachable tyres for four wheels, namely, the near front and off back of the Rolls-Royce and the off front and near back of the White, the other four tyres to be the ordinary kind as made by one of the three firms named.

I would rely solely on the usual spares and repair outfit carried by the ordinary motorist, and my opponent should, in addition to this, be allowed to call at any garage on the route traversed for replacements. Only one man for each car should be allowed to touch the tyres, and I would stake £100 that the detachable tyres lose less time on the trial.—Yours truly,

OSWALD G. MOSELEY.

EXPERIENCE WITH TYRES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—As you get many enquiries as to the cost of tyres, &c., I think that it is only fair that people should hear both sides of experiences. I have had on trial on my car three types of tyres, viz., A, B, and C. On working up the cost per mile for my one wheel fitted with the C tyre, it is hardly believable when I state that it cost over 1s. per mile.

I started first with a brand new 875 by 105 cover. By the time I had covered 300 miles the canvas was showing. I sent the tyre back to the makers, who stated that it was no fault of the cover and charged £5 5s. for retreading it. This cover was not on more than three weeks before the grooves were worn down and the tyre burst at the side, and I now have to purchase a new one for this wheel. The tyre was fitted to a 105 mm. rim, which was about 1 mm. out of size, and the makers give the excuse for the tyre bursting by saying that it was owing to the rim being the wrong size.

My experience with the A. and B. (both on back wheels) has been quite different. They have each covered about 1,500 miles and neither have been pumped up, and for comfort in riding and resiliency are to be strongly recommended, while with the other tyre it is practically impossible to tell the difference between that and a solid.—Yours truly,

A CONSTANT READER.

[The contrast between the three examples is certainly striking.]

Merry Maids a-Motoring Go.

The Misses Firth, Webster, Brakine, Bell, and Carrington, of the Vaudeville and Daly's Theatres, on a 16-20-h.p. Argyll Car.

THE FLEXIBILITY OF MOTOR-CARS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In view of the interest being taken in this subject, we proceeded, on Saturday last, to a trial of our three cars on the Hog's Back, about four miles from Guildford. The cars consisted of two Cadillacs, models A. and B., single-cylinder, 5 in. bore and 5 in. stroke; and of a Rochet-Schneider, with cardan shaft drive and four cylinders, each 100 mm. bore and 140 mm. stroke. Knowing beforehand the quickest speed these cars can attain on a level as at present geared, i.e., twenty-five miles per hour for Cadillac Model A., twenty-seven miles for Cadillac Model B., and thirty-six miles for the Rochet-Schneider, we restricted our trials to driving at the lowest speed possible on top gear, without slipping the clutch and using the throttle only. With the aid of a level and straight edge, we selected a stretch of practically level road and taped 200 yards along it. We were able to drive the Cadillac Model A. over this length in 1 min. 57 sec., and a second time in 1 min. 57 sec., the Cadillac Model B. in 1 min. 45 sec., and again in 1 min. 33 sec.; and the Rochet-Schneider in 45 sec., and again in 50 sec. Taking the lowest speed in each case, the speeds work out at 3.5, 3.9, and 8.18 miles per hour respectively.

Now comparing these lowest speeds with the highest the cars can run in our hands, we have:—

Car.	Lowest miles per hour.	Highest miles per hour.
Cadillac, model A.	3.5	25
" B	3.9	27
Rochet-Schneider	3.18	36

These figures give a greater flexibility for the single-cylinder cars as compared with the four-cylinder one, in approximately the ratio of

7 to 4½. We consider this result as likely to be of great interest to many of your readers, hence this communication to you in the expectation of your taking the same view. We would, to some extent, qualify the result by stating that, in more experienced hands than our own, the flexibility, as shown above, of the Rochet-Schneider could probably be improved upon, but certainly not, in our opinion, to such an extent as to bring it up to the ratio of the Cadillacs.—Yours truly,

JAS. C. MADELEY } M.M.I.C.E.
J. W. MADELEY }

AUXILIARY EXHAUST VALVES ADVOCATED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read many varying discussions in the *M.C.J.* relating to the above subject of four versus six cylinder engines, and that some severe offers have been made to match a four against a six-cylinder car. Personally, I am of opinion that the four-cylinder advocates have not yet struck the right note to warrant their competing with their adversaries. Now if a standard four-cylinder engine of good repute were fitted with an auxiliary exhaust, it would be a hard nut for the six-cylinder to crack, and what I am going to point out is that four auxiliary valves with their various accoutrements will cost infinitely less than two more cylinders, valves and all, both in the initiate and subsequent upkeep. The auxiliary exhaust valve should be placed at the extreme bottom of the piston's stroke and be so designed as to relieve 65 per cent. of the working charge; the remaining 35 per cent. would expand and thus become cool while passing back up the cylinder and through the ordinary exhaust valve. The net result of this idea is a clean cylinder, chock full of combustible mixture ready for the next

The Thames 50-h.p. Six-cylinder Car recently supplied to Baillie Taylor, of Carnoustie, N.B.

The vehicle was recently driven from London to its destination, a distance of about 550 miles, entirely on top gear. The owner, who is a well-known agriculturist, is seen standing at the side of his new car.

working stroke, more compression and maximum efficiency with minimum heat. It means death to the carbon deposit bugbear, and in theory, at all events, it neutralises the shock given out by the momentarily-released working charge through one valve at the top of the cylinder. An auxiliary exhaust will give buoyancy and resiliency akin to the steam car, and the efficiency of an engine so fitted would far exceed the misleading conventional estimate of h.p. based upon the bore and stroke of the cylinders. I have often wondered that such an important refinement in valve construction was not decided upon against the invasion of the six-cylinder engine.—Yours truly,

HERBERT J. CHAPMAN.

CHARGING ACCUMULATORS FROM PRIMARY BATTERIES.—“Anti-magneto” writes:—“I am a motorist, and reside at some distance from a charging main. As I wish to adopt electrical ignition in place of the magneto, I intend to charge my own accumulators, and contemplate introducing the Boron battery system, which, I am informed, is the most reliable. I should be glad if any readers who have tried this will kindly give their views on the same.”

THE directors of the newly-formed Vauxhall Motors, Ltd., include Messrs. William Gardner, Leslie Walton and Percy E. Kidner, two of whom are still connected with the Vauxhall and West Hydraulic Engineering Company, Ltd., so that continuity of the policy which has built up the reputation of the last-named concern is assured.

CLUBS AND ASSOCIATIONS

AUTOMOBILE ASSOCIATION.

THE Automobile Association will have an exhibit illustrating its work at the Travel Exhibition, which is to be held in the Horticultural Hall, Westminster, next month. Members of the A.A. will be entitled to free admission on presentation of their membership cards.

In view of the large number of motorists who announced their intention of attending the Frome's Hill Climb, on the 3rd inst., the Automobile Association decided to patrol the road from London to the scene of the contest. An official road was chosen as follows:—Uxbridge, High Wycombe, Oxford, Witney, Northleach, Andoversford, and Cheltenham, thence via Ledbury to Hereford. This road was thoroughly patrolled, and motorists visiting the hill climb were advised to follow this course.

SOUTHERN MOTOR CLUB.

THE club had a competition on Saturday over a course of about 100 miles on southern roads for the Howlett Challenge Cup and Gold Medal. Each competitor on starting was given 300 marks and half a mark was deducted for every stop; tyre stops counted half a mark for every four minutes. The winner had to make a non-stop run, and the even running of the machine was also taken into consideration. The competitors were sent off alternately in opposite directions on a circular course which was not known to them until the actual start. The winner proved to be Mr. A. Carpmael on a 9-h.p. Riley Tri-car. He lost no marks. Mr. G. Aldington (5-h.p. Twin Kerry Tri-car) was second with 297 marks. Mr. S. Newton third with 296 marks on an 18-h.p. Royal Star car, Mr. W. S. Smith (16-20-h.p. Mutel), was placed fourth with 294 marks. The previous holders of the cup were, in 1906, Mr. W. H. Lorkin, in 1905, Mr. H. Jones. This trophy has to be won three times, not necessarily in succession. Mr. Malcom Brooke started on his new six-cylinder car, but unfortunately had not gone far when a wire fused, placing him out of the running. It was the birthday of the new Malcom six-cylinder, and it was its first road trial.

WOLVERHAMPTON.

THE Wolverhampton Automobile Club held its opening meet in the Wolverhampton West Park recently, when between sixty and seventy cars assembled. The Mayor of Wolverhampton (Councillor A. B. Bantock), attended the meet on a Sunbeam car, while quite a number of local celebrities were in attendance. After the meet, several cars proceeded, in spite of the weather, to Newport for tea. In a town which has such strong connection with the motor industry as Wolverhampton, locally built cars might be expected to predominate, and this was proved to be the case by the fact that sixteen Star cars and thirty-two Sunbeams were present, as compared with eighteen of all other makes.

KENT CLUB.

THE club held the first of its luncheon meets at the Royal Star Hotel, Maidstone, on Saturday. Dr. Charles Firth, vice-Chairman of the club, took the chair. After the luncheon a committee meeting was held, and the following were elected to membership of the club:—Mrs. H. E. Straker, the Rev. — Boyd, Mr. H. B. Smith, Mr. R. H. Steen, Mr. A. B. Pilcher, &c.

MOTOR CYCLE UNION OF IRELAND.

THE open meet of the season of the Motor Cycle Union of Ireland was held on Saturday last at Portmarnock. The following are the details:—

ONE MILE NOVICE SCRATCH.

For members who never won any prize in any event promoted by the Union. N. E. Drury (3-h.p. Triumph), 1; J. Gould (3½-h.p. Morehampton), 2; J. T. Beahan (3½-h.p. Minerva), 3.

ONE MILE MEMBERS' HANDICAP.

C. W. Smith (3½-h.p. Triumph), 1; H. G. Ferguson (2½-h.p. Minerva), 2; N. E. Drury (3-h.p. Triumph), 3.

TEN MILES GO-AS-YOU-PLEASE RACE MEMBERS' HANDICAP FOR SHAW CUP.

H. G. Ferguson (2½-h.p. Minerva), 30 sec., 15 min. 31 sec., 1; R. Walsh (2½-h.p. F. N.), 2 min. 30 sec., 16 min. 36 sec., 2; H. Mouney (2½-h.p. F. N.), 2 min. 30 sec., 17 min. 20 sec., 3.

FLYING KILO.

The following took part in the competition:—H. Mouney, 2½-h.p. F. N. (15 sec.); H. G. Ferguson, 2½-h.p. Minerva (6 sec.); J. H. Drury, 3-h.p. Triumph (5 sec.); N. E. Drury, 3-h.p. Triumph (5 2-5 sec.); H. Quinn, 4-h.p. Roc (8 sec.); W. Ladley, 5-h.p. Twin Minerva (2 sec.); J. Gould, 3-h.p. Morehampton (8 sec.); J. T. Beahan, 3½-h.p. Morehampton (3 2-5 sec.); E. W. Smith, 3-h.p. Triumph (6 sec.); C. B. Fran (Klin), scratch.

DERBY AND DISTRICT.

ON Saturday the opening run of this club took place, when, as on the last several occasions, the venue chosen was Ashby-de-la-Zouch, and in spite of the inclement weather there was a large gathering of motorists and their friends. On this occasion the members of the Derby and District A.C. were joined by those of the Leicester, Nottingham, Wolverhampton and other Midland clubs. Shortly after three o'clock the cars commenced to arrive, and were stabled in the spacious yard of the Royal Hotel, advantage being taken of the interval before tea to renew old acquaintances and make fresh ones. The president of the club, Mr. Francis A. Bolton, was present on his 35-h.p. Daimler. About 4.30 the members and their friends adjourned for tea, which was served in the Royal Hotel ball-room, after which, towards six o'clock, the weather having meanwhile greatly improved, the cars began to disperse.

The Southern Motor Club's Competition.—Mr. S. Newton on his 18-h.p. Royal Star Car.

SOUTHERN.

THE handbook of the Southern Motor Club for 1907 is to hand in its usual attractive form, accompanied with No. 1 of the Southern Motor Club Gazette, edited by Mr. J. W. Lewis Cufley and full of matter of club interest.

THE MOTOR CYCLING CLUB.

THE Sharpenhoe Hill Climb, held on April 20th, was the first competition of this club's season and the first open event the Club has organised. Everyone is agreed that it was a great success. The results of the handicap will be found below. The thanks of the Club are due to Mr. W. A. Sale, of Luton, for the work he did in connection with this hill-climb.

C. R. Collier and W. W. Genn tied for the fastest time over the course.

AUTO CYCLE CLUB.

ON Saturday the Auto Cycle Club held its team penalty contest over a seventy-three miles course, from Woodford to Stumps Cross and back again. The minimum time was 3 hours 45 min., and the maximum 4 hours. The performances of the competing organisations were as follows:—

	Starters.	Non-Stop Runs.
Woolwich M.C. ...	7	4
Essex M.C. ...	11	8
North-West London ...	5	3
West Essex ...	5	2
Walthamstow M.C. ...	6	4
Lewisham A.C. ...	3	1
Auto Cycle C. ...	5	4
Black Prince ...	1	—
Motor C.C. ...	1	1
Southend M.C. ...	3	2
	47	29

That there should have been 29 non-stop runs out of the 47 starters is a tribute to riders and machines alike.

Mr. David H. Kyd, a well-known Barrister-at-Law, on his new 10-h.p. Rex Car.

This gentleman is already an expert motorist, and is delighted with his car, which he uses for town work, as well as for long tours to the southern and western counties of England.

HULL.

THE annual meeting of the Hull and District Automobile Club was held at the Imperial Hotel, Hull, Dr. W. H. Coates presiding. The secretary (Mr. B. Hancock) read the annual report. It was stated that

district councils had been written to regarding the state of roads, &c. and individuals who had proved an annoyance to motorists had been communicated with. The treasurer (Mr. A. E. Hagestadt) presented his annual report, which was highly satisfactory, there being a large balance in hand.

A vote of thanks was accorded to Colonel W. H. Harrison-Broadley, M.P., for acting as president, during the past year. Mr. A. J. Atkinson was elected president and Sir Seymour King, M.P., K.C.I.E., Mr. Guy Wilson, D.S.O., Colonel W. H. Harrison-Broadley, M.P., and Dr. W. H. Coates were elected vice-presidents; Dr. W. H. Coates was re-elected chairman, Mr. Bergh Hancock hon. secretary, and Mr. H. Whiteley hon. treasurer in place of Mr. A. E. Hagestadt (resigned). Messrs. A. E. Hagestadt and J. Richards were elected auditors. It was agreed to write to the Education Committees of Hull and the East Riding regarding the nuisance caused by the throwing of missiles by children, and asking them to instruct the head teachers to draw the attention of children to this matter.

IRISH.

THE following have been appointed repairers to the Irish A.C. for the year 1907:—Messrs. John Cleary, Fair Green, Tullow, Co. Carlow; Cleary and Company, Bagenalstown, Co. Carlow; Motor Car Repairing Company, Dublin Street, Carlow; R. Pulvertaft and Sons, 119, George's Street, Cork; Thompson Brothers, Custom House Quay, Wexford; R. H. Poole, Charleville Square, Tullamore, King's County; John Alexander, John Street, Londonderry; D. J. Thompson, Great James Street, Londonderry; A. J. Brandon, Abbey-leix, Queen's County; J. J. Ward, Eyre Square, Galway; Corrib Motor and Engineering Company, William Street, Galway; James Healy, Henn Street, Killarney; W. F. Pearce, Catherine Street, Waterford; T. K. Hinds, Kildare; Northern Motor Company, Ltd., 38, Chichester Street, Belfast; John Apperson, 31, Francis Street, Newtownards, Co. Down; W. Christy, 58, George's Street, Limerick; Burke Engineering

The Leon Bollee Car, with Landaulet Body by the Victoria Carriage Works, Ltd., recently supplied to Mr. Gerald Loder, of Ardingly, Sussex.

and Motor Company, Clonmel; D. H. McDowell, College Street, Armagh; Henry Cooke, Mill Street, Ballymena; P. J. Fulham, Lawrence Gate, Drogheda; John McCollum, Mill Street, Coleraine; P. Barrett, Carrick-on-Shannon; T. Williamson, Francis Street, Dundalk; B. Gannon, Dunleer, Co. Louth; S. F. Haines, Cumberland Square, Birr; J. W. Buchanan, Strabane, Co. Tyrone; and J. Wright, Newry.

LIMERICK.

THE members of the Limerick Motor Club opened the season on Thursday last week with a meet at Adare, Co. Limerick, the residence of Earl Dunraven, K.P., patron of the club. During the afternoon a series of speed trials were indulged in by the members of the club. The course was two miles in extent and the pace limited to sixteen miles per hour. Mr. Malcolm D. Shaw was the successful competitor, driving Lady Shaw's car just on schedule time. The following took part in the contest:—

Lady Shaw's 14-h.p. Whitlock-Aster	...	1
F. C. Clieve, 12-h.p. Arrol-Johnston	...	2
R. Roche, 15-h.p. Darracq	...	3

A. E. Browning, 9-h.p. Adams-Hewitt; Sir Thomas Clieve, 10-h.p. White steam; Sir C. B. Barrington, Bart., 9-h.p. Cadillac; Sir Alex Shaw, 6-h.p. Wolseley; M. D. Shaw, 8-h.p. Darracq; A. Blood Smyth, 6-h.p. Siddeley; Major Wise, 20-h.p. Spyker; R. de Ros Rose, 16-h.p. Sunbeam; T. D. Atkinson, 20-h.p. Darracq; G. S. Browning, 10-h.p. Peugeot; and G. Goodbody, 10-h.p. Argyll.

BLACKHEATH AUTOMOBILE CLUB.

THE opening run of the Blackheath Automobile Club took place on Saturday. About forty members and friends assembled at The Beacon, Westerham Hill, for tea. Among those present were Messrs. J. H. Bowden, 10-12-h.p. Humber; W. F. Butcher, 12-16-h.p. Clement-

Talbot; A. Cunis, 6-h.p. Regal; H. A. Cunis, 18-h.p. Regent; O. V. Flather, 15-h.p. Ariel; A. Jackson, 10-12-h.p. Georges-Richard; Professor C. J. Lambert, M.A., 10-12-h.p. Argyll; Messrs. T. Marshall, 12-h.p. De Dion; A. W. Wansby, 8-h.p. Horley; W. Whiteway, 14-16-h.p. Regal; H. Beadle, Rover.

THE open hill climb of the Essex Motor Club has been postponed to the 11th inst.

DURING the Whitsun holidays the Junior Automobile Club will have a tour into Shakespeare's country.

THE Wolverhampton and District A.C. will hold a hill-climb at Harley Bank, Wenlock Edge, on June 15th. According to the regulations, "no steam cars are eligible to compete, nor cars of which the cylinder diameter in inches squared and multiplied by the number of cylinders exceeds 125."

THE next meeting of the Institution of Automobile Engineers will be held at the Institution of Mechanical Engineers, Storey's Gate, St. James's Park, S.W., on Wednesday next, when a paper will be read by Professor H. L. Callendar, on "The Effect of Size on the Thermal Efficiency of Motors."

PARTICULARS have been issued of the Open Hill Climb promoted by the Southern M.C., to be decided on the 22nd prox. at Captain Kydd's Hill, East Grinstead. Cars will be weighed in East Grinstead, and Mr. S. W. Phillpott, 18, Gosberton Road, Balham, S.W., will supply further particulars of what promises to be a very interesting trial.

DANGEROUS DRIVING AND SPEED LIMIT.

AT Raglan, on Saturday, Mr. Harold Brewer, Cardiff, was summoned for driving a motor-car in a manner dangerous to the public on Good Friday. Mr. F. C. Shackel, Cardiff, defended. P.S. Jones, Raglan, stated that the car driven by the defendant covered 354 yards in 25 seconds, which would be a few yards under 25 miles an hour. Mr. Shackel objected on the ground that the defendant was not charged with excessive speed. In cross-examination the sergeant stated that there were no people on the road. He also stated that there was no danger to anyone, and if it had not been for the speed the car was travelling he would not have reported the case. Mr. Shackel contended that as there was no danger to anyone, as the prosecution admitted, the summons should have been either for exceeding the speed limit, or under Section 1 for driving at a speed dangerous to the public. The Bench upheld the objection and dismissed the case.

SMOKE EMISSION FROM MOTOR-CARS.

AN important appeal with reference to the emission of smoke from motor-cars was heard in the Divisional Court on Thursday, last week, the Motor Union having undertaken the case on behalf of one of its members. Mr. Horace Avory, K.C., and Mr. Grimwood Mears, instructed by Mr. Staples Firth, appeared before the Lord Chief Justice, Mr. Justice Darling, and Mr. Justice Phillimore, to support a rule nisi, which had previously been obtained to quash the conviction of the Eddisbury Justices.

Mr. W. E. Rowcliffe was summoned and convicted by the Justices under Section 30 of the Highways and Locomotives (Amendment) Act, 1878, for allowing smoke to issue from his motor-car. It was argued by Mr. Avory that a motor-car was defined by Section 1 of the Locomotives on Highways Act, 1896, and the enactments mentioned in the Schedule to that Act were not to apply to light locomotives, and that such schedules contained (*inter alia*) part 2 of the Highways and Locomotives (Amendment) Act, 1878, and that part 2 contained Section 30, under which section the Justices erroneously convicted Mr. Rowcliffe, on the ground that the car he was driving on the day in question was a locomotive which did not as far as practicable consume its own smoke. They convicted under this Act, notwithstanding the fact that they described it both as a locomotive and as a motor-car, and then ordered his licence to be endorsed under the Motor Car Act.

The Justices filed evidence in support of their conviction. It was stated that from the facts before them at the hearing of the petty sessions a great volume of smoke was emitted from the motor-car, which was probably due to carelessness. Mr. Avory at once pointed out that upon the Justices' evidence alone this brought the case within the Act, which states "that if from any temporary or accidental cause, &c." After considerable argument the Lord Chief Justice gave judgment, in which he stated that the conviction must be quashed, and as the endorsement on the appellant's licence could only be justified if there had been a conviction, and as such conviction had been quashed, the endorsement must be erased.

Mr. W. HACKER ARNOLD, who for many years managed the affairs of Messrs. Henry Whitlock, Ltd., the well-known coach and carriage builders of Holland Gate, Kensington, W., informs us that he is now conducting the business at 24-27, Orchard Street, Oxford Street, W., in conjunction with Messrs. J. A. Lawton and Co., whose reputation for high-class work is well known in the trade. Messrs. Henry Whitlock and Co. are in a position to supply high-class motor bodies and carriages of every description, and have exceptional facilities for the immediate delivery of Mercedes, Panhards, and other leading types.

ROAD REPORTS.

LUTON.—The roads in Luton and district are generally in a good condition for motorists.

TORQUAY.—The road from Torquay to Dartmouth has been quite unsuitable for motor traffic, owing to the laying of a pipe under the middle of the road. The road is very narrow, and heaps of clay and stones render the passage of cars a difficult and damaging task.

SIGNPOSTS ON IRISH ROADS.—The Irish A.C. is interesting itself in the erection of signposts in various districts, and the hon. secretary has interviewed the chairman of the Kildare County Council with reference to the subject. As a result probably three suitable signposts will be erected in the town of Kildare.

BOSTON.—The roads round about Lincolnshire are now in very fair order. The level crossing over the Great Northern Railway on the Sleaford road, about a mile from Boston, should be taken very slowly, as the driver comes over a high-backed bridge and regularly drops on the crossing, which is not over good for the springs, as our correspondent has found out; the reverse way is just as bad.

EASTBOURNE.—Success having attended the covering of the surface of the Grand Parade at Eastbourne with tarred slag, the surveyor, Mr. A. E. Prescott, is having Terminus Road, the principal thoroughfare in the town, re-covered with this material before the Whitsun traffic.

LEWES.—Two miles of the Brighton road have just been tar-sprayed. These are just outside the borough boundaries of Lewes and have been dealt with in an experimental way by the Tarspara machine, the demonstration being carried out under the observation of the surveyors of the Rural District Councils of East Sussex.

when picked up was dead. The motor-car also collided with an electric standard. The prisoner gave evidence in his own defence. When he saw the man in the road he blew his horn twice, put on his side brake and another brake, and this caused the car to begin skidding, which prevented full control just before the deceased was struck. Then it skidded another seven or eight yards. The evidence of the prosecution as to speed was exaggerated; he was not going even fifteen miles an hour. The jury stopped the case, and found the accused not guilty.

ON Monday the Lambeth coroner held an inquest on the body of a lad who was knocked down and run over by a motor-car with fatal results. The driver of the car said that he was driving a 20-h.p. Darracq from London to Reigate. He saw the children some distance ahead of him as he was proceeding along Brixton Hill and sounded the horn and eased up, when the deceased, who had nearly reached the opposite pavement, suddenly turned back just in front of the car. The witness did all he could to prevent the accident, and pulled up within four yards. The jury returned a verdict of "Accidental death," and exonerated the driver from all blame.

MISS BRASSEY, a relative of Lord Brassey, of Clock House, Edge, Malpas, has lost her life in attempting to save a pet dog from being run over by a motor-car. The story told by the driver of the car, Thomas Mason, of Liverpool, was to the effect that as he was returning to Birkenhead from Stratford-on-Avon, on nearing Clock House, Edge, he noticed a dog crossing the road and a lady running across after it a few yards in front of the car. He applied both brakes, stopping the car within its own length, but not before the mudguard of the left front wheel knocked the lady down. He was travelling at fifteen to eighteen miles an hour. The car contained a party of four, and belonged to a

Mr. J. Keele on the Belsize 60-80-h.p. Six Cylinder he has purchased, and which he will drive at the most important race meetings during the coming season, including that at Bexhill, on Whit-Monday. The photo from which the above picture was reproduced was taken outside the works at Highgate of Messrs. J. Keele and Co., the London and district agents for Belsize cars, just after the car had arrived by road from Manchester, the journey having been made without a single involuntary stop.

ROMFORD.—The urban district council, which for two seasons has treated the local roads with a dust laying preparation, has passed a resolution in favour of legislation to compel the owners of cars to contribute to the cost of the roads.

WORTHING.—There is every likelihood of a great extension of road making experiments in the town of Worthing.

NORTHWICH.—The Northwich Council have adopted chloride of lime for street watering, to abate the motor dust nuisance.

REIGATE.—We understand from the surveyor to the Reigate Rural District Council that the statement as to the intention of his Council to tar long stretches of the main road before Whitsuntide is incorrect, no such arrangement having been made.

MOTOR-CAR ACCIDENTS.

RALPH CREAK TAYLOR, chauffeur to Colonel Lockwood, M.P., was indicted at the Central Criminal Court on Saturday for the manslaughter of Richard Margerum. Mr. Arthur Gill prosecuted; Sir Charles Mathews and Mr. C. J. Mathews defended. About half-past eleven on the night of March 15, the prosecution stated, the prisoner was driving a motor-car from Colonel Lockwood's residence in Essex to his house in London. In the Seven Sisters Road, near the turning into Stonebridge Road, Mr. Margerum was standing on the pavement waiting for a tramway car to Finsbury. Presently a tramway car arrived, and as he stepped into the roadway the prisoner's motor-car came up and struck him with such force that he was carried some distance, and

Liverpool gentleman. Medical aid was summoned, but Miss Brassey succumbed to her injuries shortly after the accident.

THE LINCOLN MEET.

IN connection with the Whitsun meet of the Motor Union, at Lincoln, a party will be conducted round the Cathedral and Castle by the Rev. Canon Hicks, M.A., on the 18th inst. For the procession a most interesting route has been chosen and a special "itinerary" has been written by the Sheriff of Lincoln (Dr. Mansel Symphon). This will be embodied in the official programme. At Canwick Hall the guests will be received by Lady Cholmeley on behalf of her father and mother (Mr. and Mrs. Waldo Sibthorpe). The gymkhana will commence at 3.30 p.m. At the dinner in the County Assembly Rooms the toast list will be short; besides the loyal toast the only others will be "The Motor Union" and "The County and City of Lincoln." The guests will then adjourn to the reception rooms, where conversation will be undisturbed.

MESSRS. WEIGEL MOTORS, LTD., inform us that they have terminated their agreement with Messrs. Huntley Walker and Co., and that they are no longer their agents for the London district.

WE are informed that the Holland Branch of the Continental Tyre and Rubber Company, Ltd., has been transferred from Rotterdam to 1077 Prinsengracht, Amsterdam, where the business will be carried on in a more extensive way.

COMPANY NEWS.

NEW COMPANIES REGISTERED.

STELLA MOTOR COMPANY.—£1,000. Manufacturers of and dealers in motors, &c. First directors: Messrs. H. P. MacConnell and G. Elkin, 20, Avonmore Road, Kensington.

HOLLAND PARK MOTOR COMPANY.—£5,000. To adopt an agreement with Messrs. J. G. H. Wood, F. Jackson, and R. V. Asbury, for the acquisition of the business carried on by them as the Holland Park Motor Company. No initial public issue. First directors: Messrs. F. Jackson, R. V. Asbury, and F. Hurd-Wood. Managing directors, £100 each per annum. 124, Holland Park Avenue, W.

MINTON MOTOR RIM COMPANY.—To adopt an agreement between Messrs. V. H. Minton, F. C. Minton, and G. E. Minton of the first part, Messrs. A. E. Skidmore and H. G. Mills of the second, and Mr. A. O. Wright of third, and to carry on the business of manufacturers of rims, tyres, &c. First directors: Messrs. A. O. Wright, V. H. Minton, A. E. Skidmore, and H. G. Mills. 60, Newhall Street, Birmingham.

MESSRS. ELWELL-SMITH PETROL SAFETY GAS COMPANY.—£1,000. To adopt an agreement between Messrs. H. Elwell-Smith and A. C. M. Anderson, and to acquire and turn to account any inventions, &c.

SIMMS MAGNETO COMPANY.—£100. Magneto and motor manufacturers, &c. No initial public issue. First directors to be appointed by signatories.

OBSTRUCTING A MOTORIST.

THE Lancaster county magistrates, who have done a good deal in the way of fining motorists, had before them on Saturday a case in which a motorist was the aggrieved party. A week ago two cattle drovers were charged on police informations with obstructing the highway near the Crook o' Lune, Caton. According to the evidence P.C. Ferguson saw the men with a herd of cattle, which occupied the whole of the road, and they declined to make a way through the herd for a motor-bicyclist named Slinger, of Lancaster. The police officer got the cattle to the side of the road, and asked the defendants why they had not let the motorist pass. He took the names of the men, and when he tried to serve the summonses he found the names and addresses given were false, and he spent two days in finding the men.

Mr. Barton, a magistrate and an agriculturist, got the case adjourned for the attendance of the motorist, who was alleged to have come upon the men at a great rate and to have almost run them down. On Saturday Mr. Slinger gave evidence corroborating the police testimony, and added that he was going slow. He had his wife with him, and the men would not make any effort to get the cattle to the side of the road. He had to bring his motor to a standstill. After a long consideration in private the Chairman announced that the Bench would deal leniently with the defendants, and fined them 5s. each, without costs. The Bench also gave the men time in which to pay. It was subsequently stated that Mr. Barton had paid the fines.

POLICE TRAPS.

ACCORDING to Mr. Plowden, the magistrate at the Marylebone Police Court, what every motor driver may hope and pray for is that he may never fall into a trap.

CHESHIRE is now familiar with police traps for motorists, and on the roads leading from Birkenhead special care should be taken.

A TRAP about two miles to the west of Marlborough, on the London-Bath road, is becoming a source of profit to the authorities.

SHOOTERS' Hill Road is again being infested with police traps, and, as a result of official observation, four motorists have just been fined 20s. and costs at the Greenwich Police Court.

RIVERSIDE motorists have knowledge of motor traps in the neighbourhood of Walton-on-Thames, Hampton Court, &c.

MOTORISTS should be careful when driving from Lewes to Eastbourne or Hastings, as there is a trap on the road across the Dicker Common; also at the cross roads near Arlington, on same road. There were seventeen victims before the Bench, at Hailsham, on Wednesday week, and none got off. The police evidently like trapping on this road, and a resident is not averse to giving them every information and facility for their work.

COMPLAINTS by a motorist at Chester on Saturday against the police method of timing cars in Cheshire did not save him from being fined, with costs.

AERONAUTICS.

THE Hon. C. S. Rolls has made an ascent from Short's Balloon Works, at Battersea, in his balloon "Britannia," which reached a height of 5,500 feet, carrying nine passengers, who included Lord Dalmeny, Lord Northland, Sir Hugo de Bathe, Sir Charles Ross and Captain Corbet.

SCOTTISH RELIABILITY TRIAL, 1907.

THE Scottish Motor Trade Association, Ltd., have placed at the disposal of the trials committee a prize value £10, to be awarded to the member of that association competing in the trial whose fuel consumption per ton mile is lower than that of any other member competing.

PUBLIC MOTOR SERVICES.

THE BOLTON TRAMWAYS COMMITTEE has engaged a motor-'bus for an experimental service.

AN afternoon motor service has been established between Hythe, Dymchurch, Romney, and Littlestone.

PETITIONS have been presented to the Great Western Railway Company from residents about Falmouth in favour of the establishment of a road motor-service in the Roseland district.

By a majority of one the Todmorden Town Council have agreed to the purchase of more motor-'buses for public service in the town.

DAILY motor-car trips are being run between Canterbury and Folkestone.

THE Brighton Watch Committee have decided that motor-cabs constructed to carry four adult persons inside will be licensed as first-class hackney carriages, and that motor-cabs constructed to carry fewer than that number of adult persons inside will be licensed as second-class hackney carriages.

"DON'T'S" FOR MOTORISTS.

Don't forget that even pedestrians have their rights.
Don't blow your horn as if it was the last trumpet.
Don't leave too many tools on the road.
Don't forget to pump your tyres; a pump in time saves ninety and nine.
Don't kill more dogs than you can help; it's bad for the car.
Don't forget that on the road it is usually the unexpected that happens.
—Truth.

BUSINESS NEWS.

THE winners of four events in the Motor Cycling Club's hill-climb at Sharpenhoe Hill, Luton, rode motor-cycles fitted with Dunlop tyres.

THE Motor Supply Company, Ltd., have removed from Jermyn Street to large new premises at 111, Piccadilly, London, W.

BOWLEY's motor spirit and lubricating oil are, we learn, being used by the Hotchkiss six-cylinder car in its 10,000 mile trial through Great Britain.

THE Shrewsbury and Challiner Tyre Company, Ltd., have issued a circular of their pneumatic tyres and of other detachable rims which can be attached or detached within a minute. Their London address is Page Street Works, Westminster, S.W.

A USEFUL list of agents who have been appointed by the Elastes Company, and who have the requisite mounting levers to deal with the tyres of provincial clients who are thinking of adopting this successful innovation, has been issued by the Elastes Co.

THE Electric Ignition Company, Ltd., of Sampson Road North, Birmingham, inform us that the following American motor firms have placed contracts with the holders of the patents under which they manufacture accumulators, viz., the Winton Motor Carriage Company, the Wayne Automobile Company, the G. N. Pierce Company, the Pope Manufacturing Company, and the Victory Motor Car Company.

WITH reference to the Targa Florio Race, we learn that the two De Dietrich cars which competed, and which finished fourth and sixth, were fitted with ordinary standard 40-h.p. engines. Messrs. De Dietrich tell us that they were very greatly handicapped by being unable to get the vehicles out in time to have much practice, and when they reached Sicily they found the roads very bad owing to heavy rain. It is interesting, too, to notice that there was only a difference of 39 sec. in the running times, Duray covering the 450 kilometres in 8 h. 39 min. 7 sec., and Gabriel in 8 h. 39 min. 46 sec.

MR. F. EASON, who has been connected with the motor trade for nearly ten years, informs us that he has resigned his position with Messrs. Jarrott and Letts in order to enter into partnership with Mr. H. H. Sternberg, who has been associated for some little time with the Mors Company. The new firm, which will be known as Messrs. Sternberg and Eason, have secured the sole British agency for the Buick motor-cars manufactured by the Buick Motor Car Company, Flint, Michigan, U.S.A., one of the largest motor-car manufacturers in the States. In addition to handling the Buick cars, they will act as general agents, and are prepared to supply any make of car from the new depot they have established at 15, Poland Street, Oxford Street, London, W.

AN important addition to the motor-car show rooms of London has just been opened at 2, Albemarle Street, Piccadilly, W., by Messrs. John I. Thornycroft and Company, the well-known engineers of Chiswick, Southampton and Basingstoke, where examples of the various models of the Thornycroft cars are now on view. Three models are now made, viz., 14 and 30-h.p. four-cylinder and 36-h.p. six-cylinder vehicles. The new premises, which are situated close to Piccadilly, comprise a tastefully decorated show room and offices on the ground floor, with ample accommodation for the storage, repair and cleaning of cars in the basement, which is reached by a hydraulic lift capable of carrying a load of two tons. In the basement are also situated the general and petrol stores. The show room will be well lighted during the winter months by numerous Tantalum lamps and heated by electric radiators, and visitors will find that their comfort has been carefully studied in the general arrangement of the premises. With the opening of their new show rooms Messrs. Thornycroft have brought out a new catalogue giving illustrations and full particulars with prices of their latest models.

THE Motor-Car Journal.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

The Thermal Efficiency of Motors.

PROFESSOR CALLENDAR gave a suggestive and well-nigh exhaustive paper on "the effect of size on the thermal efficiency of motors" before the Institute of Automobile Engineers on Wednesday. It is scarcely necessary to remind readers that the thermal efficiency of an internal combustion motor is limited by the heat lost during ignition and expansion to the cooler walls of the cylinder, and also to the heat remaining in the exhaust gases at the end of the expansion being rejected unused. The former losses, Professor Callendar pointed out, are in part avoidable; those of the second kind are in a sense unavoidable, and constituted the main subject of his paper. He went on to say that, other things being equal, a small engine is less efficient than a large one, and referred to some of the general results of some reliable experiments with a small petrol motor. In our next issue we hope to publish the conclusions to which these have led the Professor—results of considerable importance to the designer of the modern car.

Mr. Rudyard Kipling's Views.

MR. RUDYARD KIPLING was a distinguished guest at the fifth annual dinner of the Automobile Club of South Africa, held at Cape Town, and submitted to the company the toast of the Royal Automobile Club of Great Britain and Ireland. In the course of an interesting speech he made some comparisons between the condition of the roads in the old days of stage coaches and that of to-day, when automobiles seem in a fair way to take the place of the ancient form of locomotion. Referring to the London and Brighton run in 1896, which he himself witnessed, he humorously remarked that there were now no cars like those. Since the advent of the motor vehicle, "the loafer, the botanist, the tramp and the dog" had had to clear out of the way. Thanks to the efforts of the Automobile Club, and of those who had done much to further the organisation of the motoring community, many public prejudices had been removed, and so well had the movement prospered that it now promised to go higher, and he thought that in five years—sanguine prophet that he is—the airship might be in general use. In this connection he thought that South Africa would be a popular site for aeronautics. But before they invade the clear skies of our Colonies, airships must be able to rise in the murkier atmosphere of the Alexandra Palace.

Unattended Horses.

THE decision of Mr. Justice Bray in the case of Ward v. Smallwood, which came before him on Saturday by way of an appeal from the Northumberland County Court judge, is hardly satisfactory to the public in general nor to motorists in particular. In this case the plaintiff was driving his motor-car from Morpeth to Newcastle-on-Tyne along the Great North Road, when he saw in front of him a covered van drawn up at the side of the road while the driver was delivering goods. Just as the motor-car drew level with the van the horse swerved into the middle of the road, and the automobilist was driven into a ditch in order to avoid a collision. The car was

damaged, and it was urged on behalf of the plaintiff that the driver of the van was negligent in leaving the horse unattended. The county court judge had held that there was no negligence on the man's part in leaving the cart and going into a cottage with bread. The Divisional Court dismissed the appeal, with costs. It was a question of fact which the county court judge had decided, and Mr. Justice Bray asked if every baker in the country was to be obliged to send a man and a boy with his bread cart. We would ask his lordship if horses of uncertain temper and liable to sudden frights are to be allowed to stand unattended on the roadside. In the early days of motoring the subject was often keenly discussed, for the unfamiliarity of horses to motor-cars resulted in several accidents. Now, according to the latest legal dictum, we have no legal remedy for the risks we run.

The Road Question.

FOLLOWING the recent conference of road makers and road users held at Olympia, when the time at the disposal of speakers did not allow anything like adequate discussion, there will be a further meeting at which the papers read will be fully debated. This will take place at the Institution of Civil Engineers on Monday and Tuesday, June 10th and 11th, with Sir John Wolfe Barry, K.C.B., in the chair on both days. The Roads Improvement Association has taken the matter thoroughly in hand, and the conference should do much to focus public attention on the experiments which will shortly be conducted under its auspices. It is to be hoped that many of the road surveyors who have given the subject any practical study will be prominent in the discussion. The ultimate solution of the problem can only be arrived at by the joint efforts of those who make the roads and those who use them, hence the importance of the gatherings shortly to be held.

For Man and Beast—but not for Car.

A NEW problem has arisen in the councils of the Metropolitan Drinking Fountain and Cattle Trough Association. That worthy institution, which has for years provided drinking water for man and beast, has discovered that motor vehicles are also among the recipients of its liquid bounty. The man who cleans the trough at Hyde Park Corner—one of the busiest centres of London's roar and traffic—reports that several conductors of motor-buses are in the habit of taking water from the trough. This predatory habit has been reported to the Westminster City Council, and the Clerk has been instructed to take proceedings against the next person discovered taking water from the receptacle for any purpose other than drinking, i.e., if he is discovered by someone in authority.

The Accident Season.

THE spell of sunshine which brightened the landscape on Saturday brought from their winter inactivity many a motor-car and motor-cycle. Unfortunately the week-end was signalised by an unusually large number of fatal accidents, while the number of serious mishaps was equally extended. This is regrettable, and we notice many of the daily papers have taken prompt advantage of the fatalities to revive some of the old prejudice against the car. On Monday morning three of the

London daily journals gave up half their placard space to alarming their readers with notifications of these accidents, and in chronicling the sad happenings detail embellishments were not omitted. Of course it is the primary duty of a newspaper to chronicle news, and the general press has to cater for all classes of readers, but that is no reason why opportunity should be so readily taken to secure a recrudescence of the feeling that was rampant some months ago. At the same time a careful study of these fatalities proves conclusively that the danger lies, not so much in the automobile, as in the vagaries of the public. In London most of the mishaps arose from indecision on the part of the victims; in the country carelessness on the part of cyclists was the cause of two or three which loomed large in the public print. Now that the touring season has commenced care must be exercised by all road users alike, so that life may be secure and nothing done to mar the progress of the motor-car industry.

The Princess of Wales in a Steam Car.

DURING the recent visit of the Prince and Princess of Wales to Scotland they were the guests of Lord Blythwood at Blythwood, Renfrew—one of the most enthusiastic motorists north of the Tweed. He is particularly partial to the White steam car, and their Royal Highnesses went to most of their

public functions in a vehicle of that type. In the accompanying photograph the Princess of Wales is seen alighting from Lord Blythwood's 30-h.p. White car at Blythwood House after her visit to Govan to lay the foundation stone of the new infirmary there. His lordship may be easily recognised in the photograph.

A Fiat Trip.

LONDON to Brighton is a familiar run to motorists; it is now being popularised by the Fiat Company among the non-motoring public, who appreciate quick and comfortable travel. The institution of the motor coach service has been a pleasing innovation of this season, and has done something to advance the interests of the movement at London by the Sea, where Fiat Motors, Ltd., have established a fine garage—notable among the motor establishments of the south of England—in St. James Street. This has lately been extended, and to commemorate the development a luncheon was held at the Royal York Hotel, Brighton, on Tuesday. The day was not an ideal one for motoring, and the venturesome souls who were conveyed thither from London in fourteen Fiat cars, a motor-bus and a motor-coach found the skies in tearful mood. True the dust

was laid; but spirits, too, were depressed, and everyone was glad of the halt at Crawley.

London to Brighton.

THEN again to Brighton, where Mr. D'Arcy Baker welcomed the company, and in the presence of Sir John Blaker, several ex-mayors, Mr. Victor Miller, and other well-known people, the rain-storms were forgotten and enthusiasm revived. The extension of the company's operations at Brighton is an event of considerable local importance; it also means much to the crowds of motorists who make the place a rendezvous throughout the season, and who will be glad to hear of this considerable addition to the facilities for the repair and storage of cars in the town. Among the guests was Mr. K. Okura, a well-known Japanese gentleman, who already owns a 30-40-h.p. and a 120-h.p. Fiat, and who is about to take to Japan a six-cylinder vehicle of the same type.

The Law's Delay.

LIKE Browning's mills of God that grind slowly but "they grind exceeding small," the limbs of the law may appear somewhat laggard at times, but they do not always forget. This was made clear at the Arundel Police Court on Monday, when Mr. Montague Graham White and Mr. C. F. Cave were summoned for offences alleged to have been created so long ago as July 22nd and August 3rd last year respectively. Nearly a year has thus elapsed since they exceeded the legal rate of speed, so that detailed evidence must have been exceedingly difficult, if not impossible, to obtain. In the first case the fine was £8 and costs, and in the second £5 and costs, the magistrate, in fining Mr. Cave, remarking that six persons had been killed on Saturday and Sunday by motor-cars, and declaring that the public had a right to protection. If the latter statement is correct why do the police not do their duty instead of leaving thieves and vagabonds alone while they are setting traps for motorists?

Police "Justice."

A NEW view of police justice is suggested by the action of the Chief Constable of Huddersfield in wishing to withdraw a case against a motorist after causing him to incur considerable expense. Mr. Cardwell, of Nottingham, was summoned for driving a motor-car at a speed of twenty-four miles an hour, and when the defendant appeared at the Huddersfield Court, Chief Constable Morton said that, having regard to the fact that the speed was not much over the legal limit, and that the defendant had been put to considerable expense, he should prefer to withdraw the case. When, however, the chairman of the Bench pointed out that such a course would establish a precedent, he went on with the matter, and in the end a fine was imposed. It would appear from this policy of vacillation that the police themselves were uncertain as to whether their action was really warranted, and whether they were doing right in taking proceedings at all. Certainly, however, it is a new reading of English law if a constable can, after involving heavy expenditure on the part of a defendant, suggest getting rid of the case without the latter being allowed to plead on his own behalf.

Heavy Motor Traffic in Kensington.

LEGAL proceedings have been initiated by the Kensington Borough Council which may lead to the most important litigation which has taken place since the Motor Car Acts came into force. The Borough Council have obtained the fiat of the Attorney-General to apply for an injunction to restrain the owners of certain motor vehicles from using on any highway in the borough any locomotive engine or other vehicle "of such construction or in such manner as by noise or vibration to cause a public nuisance." The firm against whom the injunction has been applied for are members of the Commercial Motor Users' Association, and the case has been brought before the Executive

Committee. It has been suggested to the Association that the firm in question have been made the defendants in this action "because in their case the employment of such engines is not very vital to them, and they could without much loss return to the use of horse-drawn vehicles, but if the firm do not defend this case, and the injunction is given against them in default, it will constitute a very serious precedent, and from inquiries that have been made it is evidently the intention to proceed in turn against all users of motor vehicles, in order that thorough authorities may obtain the power of preventing any class of commercial and public service, and possibly pleasure vehicles, using their streets." The matter is also under the consideration of the Motor Union.

Motor Sports.

ELSEWHERE we detail the results of the Frome's Hill climb promoted by the Herefordshire Motor Club on Friday last week. This event is now regarded as the opening of the sporting season so far as Motorism is concerned, and, judging by the way it was supported, motorists do not seem to have tired of

suggestion of the promoters of motor services and of the engineers of London bus companies. New inventions are always considered with a view to the publication of particulars provided they appear to have points of novelty or utility, and correspondence on such matters is welcome. With the return of the motorist to the road and the revival of the dust nuisance the brains of inventors will doubtless get to work again, with, it is to be hoped, due consideration of scientific data and facts. One, at least, of our correspondents is searching for knowledge in this direction, and wants to know the proportion of dust caused by atmospheric disturbance and by the body of the car passing over the loose surface. Who can tell?

Petrol and its Price.

NOTWITHSTANDING the widely-expressed desire on the part of motorists for a cheaper fuel, and the efforts made by distributing companies to supply something that will answer the purpose and yet be less expensive than the ordinary motor spirits, the demand for the cheaper grades (of heavier gravity) shows little increase. Experts seem to be

The Frome's Hill Climb.—General View of the Starting Point.

hill climbs, either as spectacular events or as trials of cars. If anything, Friday's meet was too successful from a popular point of view, the spectators crowding on to the course and seriously hampering the movements of the competitors. Such a testimony of the public interest will perhaps be regarded by the promoters of the Brooklands Motor Track, illustrated in our last issue, as a hopeful augury for the success of their venture.

New Ideas.

REGULAR readers are well aware of the information we give from time to time with regard to the institution of new motor services and the development of those already in operation. This feature has resulted in the recognition of the M.C.J. as the organ of the Public Motor Services in many parts of the country, and the organisers of such are thanked for their encouragement of our efforts to chronicle the doings of such methods of public convenience. Evidence of how we are regarded in that respect has been unusually plentiful since the Exhibition at the Agricultural Hall, and numerous inventors of non-skidding devices have brought their notions to us at the

turning their attention to other fuels, such as alcohol, paraffin and even acetylene, but long before these can in any appreciable way take the place of the lighter motor spirits there is a large amount of the heavier spirit available, which far exceeds the so-called substitutes in value as a motive power. With reference to the suggested reduction in price of petrol by reason of the Suez Canal route being opened to naphtha steamers, it has been reported that this saving will amount to 50 per cent. Such a calculation is absurd. At the most it cannot be expected to materially reduce retail prices, for if the whole of the freight from Eastern fields to the United Kingdom were saved, and the spirit transported at no cost whatever, it would make a difference of only 1½d. per gallon. Motorists already have the opportunity to effect this saving by using heavier spirits, such as the "Anglo '760," without waiting for any reduction in price on account of restrictions in the Suez Canal. For motorists with heavier cars this should be attractive enough to warrant their using the heavier grade as the warmer weather comes on—no change or adjustment of carburettors other than a liberal supply of air being necessary.

THE PROGRESS OF AUTOMOBILISM IN SOUTH AFRICA.

By C. R. BRADFORD, Hon. Secretary of the Natal Automobile Club.

(Concluded from page 205.)

THE commercial side of motoring has not up to the present been developed to any extent. There are, however, several vehicles in use for trade purposes in Capetown and Johannesburg, and these have given the greatest satisfaction. About four years ago one of the largest firms of cartage contractors of Durban launched out in this direction and acquired ten or more petrol lorries. These rendered excellent service, but when the trade slump came it was discovered that, in order to reduce their cartage plant, a better return could be obtained by disposing of these vehicles in England than by selling off their horses and wagons. The former course was resorted to, but I am given to understand that on the revival of general trade conditions, and when horses can be realised at anything like value, motors will again be adopted. The South African breweries have used several heavy steam lorries for collection and delivery, and they have proved successful in every way. Motor-bus services have been

A Daimler Car waiting for the Ferry at Bommel, to cross the Rhine.

tried in Johannesburg and Durban, but, owing to the fact that the trials occurred some three years ago, when these vehicles were practically in the experimental stage, and the old difficulty of obtaining qualified mechanics and drivers cropped up, these services were abandoned. There is no doubt that this field, given the right class of vehicle and good management, is capable of great development. The success of the commercial vehicle, either for passenger or goods traffic, depends largely on the man at the wheel, and up to the present such ventures have not been in the hands of practical men. The matter of motor vehicle communication between small villages lying some distance from the railway line has, on several occasions, been considered by the Natal Government, and it is quite within the range of probability that an experiment will be made by instituting a service between Howick railway station and Howick village, a distance of about five miles. As regards the use of the motor-wagon for the transport of farm produce, there can be little room for doubt that this will have to be adopted at an early date. This is a country in which the many ills which cattle flesh is heir to so frequently manifest themselves, necessitating the isolation of certain districts, owing to rinderpest, tick fever, &c. Thus the transport of goods and produce by the slow, old-fashioned bullock-wagon and horse power render that means of locomotion impracticable. It is the writer's opinion that, given a suitable class of vehicle for farm purposes, there is a large opening for the light delivery wagon. That farmers have so far failed to patronize this style of transport is solely due to the fact that the

many benefits to be derived have never been demonstrated to them.

Another class of commercial vehicle for which there will also, no doubt, be a good demand is the delivery vehicle for loads up to about two tons. The specification of the same, so far as can be ascertained at present, should be on the following lines:—The motor should be of the vertical four-cylinder type and of about 15-h.p. The water cooling system should be of extra capacity, and the ignition by magneto of either the high or low tension type; the latter has proved most satisfactory in this climate, and seems to be less liable to break down. The carburettor should be conveniently placed and should be capable of easy adjustment owing to the great difference of temperature in the summer and winter seasons. The crank case should be built with large inspection doors and the whole of the engine should be so placed as to be easily handled, or removed without difficulty. The lubrication system should preferably be of the mechanical class, working and stopping with the engine. The transmission for this class of vehicle should be of the simplest. The sliding change-speed car, with three speeds forward and reverse, should have substantial pinions, the speed to be three, six and ten miles per hour normal. The axles and springs should be of especially strong build, and the wheels should be about 34 inches in diameter and shod with either solid or block rubber tyres.

The majority of private cars are those owned by doctors, and until a great improvement has taken place in the roads of the colony there is only a very small field for the high-powered heavy touring car.

The streets of the principal towns are, on the whole, fair. In Durban, as yet, there are many miles of sandy roads that have to be hardened. The roads within the town area are maintained by the municipal authorities. The main roads of the colonies are constructed and maintained by the Governments, and are under the control of the Public Works Department. A large sum is spent annually on these roads, but, owing to the bad system of construction and repair and the scarcity of proper supervision under which the repairing gangs work, this money is practically wasted. The trunk roads were constructed in the early days when there were no railways, and the whole transport was by coach or bullock wagon, and are merely cuttings through the hills, with no macadamizing whatever; and in summer (the wet season) they are mud tracks, and in the winter (dry season) sand beds. A few of the larger rivers are bridged, but many with 18 in. to 2 ft. of water have to be forded, consequently it is advisable to place the carburettor and magneto on cars as high up as possible. Motorists still live in hopes of a better state of affairs coming about at an early date, as in all the Parliamentary elections throughout South Africa of late years extensive use has been made of motor-cars by candidates both for town and country.

There are several automobile clubs, the oldest being that of Capetown, with a membership of about 100. The next is that of the Transvaal, with a membership of nearly 200. The Natal Club has fifty members, and a new club has just been formed in Bloemfontein. The clubs are working together for the general interest of the movement, and, as the majority of the wealthy men in the colonies are owners of cars, their influence is felt to a considerable extent. The whole of these clubs keep up an active programme of runs and gymkhanas, as well as occasional trials. On the whole, the automobile world in South Africa is in a flourishing state, and only suffers for want of proper exploiting by manufacturers or their representatives.

IN connection with the A.C.F. Grand Prix race the Secretary of the Royal Automobile Club has arranged that there shall be a permanent official of the Service of Mines at Dieppe prepared to issue drivers' licences, and to attend to other formalities in connection with the circulation of British cars in France. An agent has also been appointed to take charge of members' triptiques, accommodation has been secured for thirty cars, and an option covering fifty rooms has been obtained from the Hotel Metropole.

The Frome's Hill Climb.

THE Frome's Hill climb has come to be regarded as the Alpha of the motoring season of the year in this country, and has prior place, in point of time, to the Tourist Trophy, the Irish and Scotch Trials and the countless inter-club events that contribute to the activity of motorists in the United Kingdom. Some measure of its importance may be gauged from the fact that it attracted 112 entries, while a better estimate was obtainable at Hereford on Thursday of last week, when practically the whole of the British motor trade wended its way to the ancient city of Hereford—awakened from its

Hereford as judge, the officials of the R.A.C. as timekeepers Mr. A. Townsend as marshal in place of Mr. J. W. Orde, who was unavoidably absent, and Mr. Groom as hon. sec. Thanks to the efforts of the Automobile Association as well as to the early hours at which many of the competitors travelled to Hereford, those who went by road were generally unmolested, and it was a sanguine, happy crowd that set forth to Frome's Hill on the morning of the 3rd inst. More than a hundred of the entrants had reported themselves. There was a freshness in the air, and the dust had been effectively laid by a good shower on the previous

The Frome's Hill Climb.—Viscount Ingestre on a 15-h.p. Clement-Talbot which proved the winner of Class 3.

somnolence by the tooting of horns and the whizzing of cars, that quickened the pace of everybody about that region.

The hill where the annual open hill climb of the Herefordshire Automobile Club takes place was first discovered by motorists during the Light Car Trials of 1904—an event which was held in the apple country, owing to the persistent advocacy of Mr. Wilfrid Groom, the hon. secretary of the county automobile club, whose endeavours for automobilism have been of no light value to the movement in Herefordshire and round about. He has now the satisfaction of knowing that the Frome's Hill climb is one of the popular events open to motorists, having this year produced a larger entry than any other trial that will take place. Frome's Hill is about a dozen miles distant from Hereford, and the course over which the cars were timed by Messrs. Ebbelwhite and Straight was 3,867 ft. in length, with an average gradient of 1 in 11.22, and 1 in 6.37 at its steepest point, not far from the summit. It is of a sinuous character and altogether as much a test for the driver as the car.

The event of Friday last was well officered, with Mr. J. T.

day. Just as in Manxland nature revels in her green and gold, so Herefordshire was bespattered with green and white as we went by orchard-lined lanes with trees laden with their snowy blossoms. Many of the Press set forth on the petrol-electric bus of the British Thomson-Houston Company, which made the trip in less than an hour and arrived in good time to give us opportunity of bidding good-morning to earlier birds than ourselves.

The cars were lined up in a meadow at the foot of the hill, and there was a great crowd of spectators, but probably the largest concourse of observers was at the top, where the rise of practically one in six was likely to prove troublesome. So far as hill climbs are concerned one is much like the other, and in regularity of starts and the celerity with which the vehicles were despatched that of Friday was equal to its predecessors; so that, when we have said that by the luncheon all the cars had had a trip up the hill, an idea of the capital organisation of the event may be gleaned.

In Class I. there were twenty-five entries, ranging from the 6-h.p. single-cylinder Rover entered by Mr. James Fryer, the well-

known motor agent, of Ross, to the 12-h.p. two-cylinder Riley driven by Mr. Victor Riley. All these small vehicles made a good showing, and memories of last year's successes of the Alldays cars were recalled when the 10-h.p. Alldays passed a Darracq on the way. That prepared spectators for the official return, which showed that the five fastest vehicles in the class were as follows:—

Car.	Entrant.	Time behind the fastest.	
		m.	s.
9-h.p. Riley ...	V. Riley ...	0	0
10-h.p. Alldays ...	W. Allday ...	0	11½
10-h.p. Alldays ...	F. W. Huband ...	0	14½
10-h.p. Alldays ...	S. Downing ...	0	17
10½-h.p. Clyde ...	G. H. Wait ...	0	17½

Class II. only attracted nine entrants, eight of which faced the starter. Much interest was taken in the American representatives, the merits of the Reo being already known, and the Buick having yet to make fame in this country both for itself and

24-28-h.p. Metallurgique, the good hill-climbing powers of which have often been demonstrated by Mr. Oscar Cupper. In this class, too, account must be taken of the splendidly consistent team running of seven 18-h.p. Siddeley cars entered in Class III. There was only twelve seconds difference between the slowest and speediest of the lot—a regularity of running that occurred again in the fourth class, thus adding to the good account of itself which the Siddeley car has always rendered on Frome's Hill. The Rovers, the Coventry Humber, the West-Aster, and the Star were also conspicuous in this class, the fastest time in which was made by the Metallurgique, with runners up as follows:—

Car.	Entrant.	Time behind the fastest.	
		m.	s.
24-h.p. Metallurgique ...	O. Cupper ...	0	0
20-24-h.p. Clément-Talbot ...	W. Stokes ...	0	0½
15-h.p. Clément-Talbot ...	Viscount Ingestre ...	0	5
16-20-h.p. Calthorpe ...	G. W. Hands ...	0	5
18-28-h.p. Clément ...	A. Mosses ...	0	15

The Frome's Hill Climb.—A General View of the Finishing Point.

for Mr. Frank Eason, who signalled his entry into business on his own account by running the car into fifth place in the fastest time category, despite the fact that the vehicle had only just been received and had not been tuned up. The order of running was as follows:—

12-16-h.p. Clément-Talbot ...	Earl of Shrewsbury ...	0	0
— Vulcan ...	T. Rimmer ...	0	25
12-16-h.p. Clément-Talbot ...	T. H. Woollen ...	0	48½
— West-Aster ...	P. R. Lamb ...	1	18½
18-h.p. Buick ...	Frank Eason ...	1	21½

In many respects the most interesting class was the third, the entries numbering twenty-six, ranging from the 15-h.p. Coventry Humber entered by Mr. Walter Phillips to the 24-32-h.p. New Leader of Mr. Robert Goodenough. With the exception of the six-cylinder Horbick, all the vehicles were of the four-cylinder type, and the fact that they were of a popular power for touring purposes gave the public a concern in their performances. The event proved a triumph for the Clément-Talbot cars, which eventually won gold and silver medals; distinction also being obtained by the 18-28-h.p. Clément and the

By reserving the larger cars for the later events of the morning the interest of the spectators was well maintained and Class IV. was anticipated with some zest. There were thirty-two entries, including the 15-h.p. six-cylinder Standard of Mr. Charles Friswell, the others ranging from the 18-h.p. Siddeley to the 35-45-h.p. Gladiator. Remarkably good runs were made by the T.T. Arrol-Johnston, and the 40-h.p. Berliet and the 24-h.p. Buick also did well. The B.T.H. petrol-electric 'bus was entered in this class, but it had had its run before in Class I., so that the course was afterwards clear for the cars of smaller passenger capacity. In the end the fastest runners in the fourth class were:—

Car.	Entrant.	Time behind the fastest.	
		m.	s.
40-h.p. Berliet ...	J. E. Hutton ...	0	0
"T.T." Arrol-Johnston ...	vice J. S. Napier ...	0	0½
30-h.p. Siddeley ...	Owen Clegg ...	0	9½
— Brasier ...	S. Sanderson ...	0	15½
24-h.p. Minerva ...	D. Citroen ...	0	16½
24-h.p. Buick ...	H. H. Sternberg ...	0	16½

Class V. had eighteen entrants, three of which were six-cylinder cars, viz., the Napier, Minerva, and Simms-Welbeck. The h.p. of all the vehicles was in the 30-40-h.p. category, and some very quick runs were made, the Spykers, Iris, La Buire, Napier, Daimlers, and Ariels all appearing to do well, and in the end it was found that the fastest times of the day had naturally been made in this class. Mr. H. Holder on his Daimler romped up the hill in 1 min. 26 2-5 sec., and Capt. Hughes-Morgan followed, but 3 1-5 sec. slower—also on a Daimler—the order of time being:—

Car.	Entrant.	Time behind the fastest.	
		m.	s.
35-h.p. Daimler	H. C. Holder	0	0
35-h.p. Daimler	Capt. D. H. Morgan	0	3
40-h.p. La Buire	Hollingdrake Auto Co.	0	6½
30-h.p. Ariel Simplex	E. Herrington	0	7
30-h.p. Daimler	P. Brodtmann	0	8

It may be mentioned that the La Buire arrived too late to be eligible for the competition, but was allowed to be timed, so that a record of its capability could be obtained.

S.M.	Name of Car.	Bore.	Cylinders.	Entrant.
...	10-12-h.p. Clement-Talbot	100 mm.	2	T. W. Bowen.

The Frome's Hill Climb.—Competitors Preparing to Leave Hereford.

It was unfortunate that the last event of the morning was marred by an accident, a spectator being knocked down and his leg broken by the rider of the motor-cycle entered by the hon. secretary of the meet for club motor-cycles. The silver challenge vase in this event was won by a 5½-h.p. Rex motor-bicycle in 1 min. 5 1-5 sec., being at the rate of 52 miles per hour.

With regard to the open events detailed in the foregoing report, the official awards of gold, silver and bronze medals as well as certificates were announced at the dinner held in the Town Hall Assembly Rooms, Hereford, on Friday evening, when we learned that the City of Hereford Trophy for the most meritorious performance had been awarded to the 12-16-h.p. Clement-Talbot car, driven by Mr. George Day. The Clement-Talbot firm were also successful in securing the gold medal for the best team performance, all the awards being made on the R.A.C. handicap basis.

CLASS 1.				
G.M.	Name of Car.	Bore.	Cylinders.	Entrant.
...	8-h.p. De Dion	3½	1	Newey Motor Co., Ltd.

CLASS 5.				
G.M.	40-h.p. Napier	4 in.	6	Cecil Edge.
S.M.	30-40-h.p. Daimler	124 mm.	4	Paul Brodtmann.
B.M.	35-h.p. Daimler	134 mm.	4	H. C. Holder.
Cert.	35-h.p. Daimler	134 mm.	4	Capt. G. Hughes-Morgan.

With regard to the behaviour of tyres in the competition, it is of interest to record that forty of the vehicles were fitted with "Continentials," which behaved so well that these cars won a gold medal, two silver awards, two bronze distinctions and also four certificates. In addition to this, Captain Hughes Morgan's Daimler, which made the second fastest time, and Captain Brodtmann's Daimler, which was credited with the fourth fastest time, were also fitted with Continental tyres. Three gold medals were awarded to cars with Dunlop tyres, and other vehicles similarly fitted were placed in Classes 3, 4, and 5. The fastest time in the competition was on a Daimler fitted with Dunlop tyres, and it is a remarkable coincidence that both these and the Continental tyres each obtained nine awards.

With regard to the details of this successful event, we may mention that not only were the Sunbeam and Wolseley cars at the service of the officials, but the Wolseley staff of draughtsmen rendered good help in working out the handicaps.

In the evening Mr. A. W. Foster, the president of the Herefordshire Motor Club, took the chair at the dinner, at which the officials and competitors in the day's proceedings were present. Following the loyal toasts, Mr. Charles Jarrott proposed "Prosperity to the Herefordshire Automobile Club," and referred to the part played by the local club in developing the sporting aspect of the industry. In acknowledging the compliment the President dwelt upon the recent advance in the British motor-car industry, and expressed the pleasure of the Herefordshire Club in being able to do something to give motorists the opportunity of testing the good quality of their cars. Mr. T. H. Woollen gave the toast of "The City of Hereford and Donors of the Trophy," which had been won by his firm, and Mr. H. C. Beddoe responded, calling attention to

A NOVEL CAR.

THE accompanying illustrations depict the interesting 40-h.p. six-cylinder car which Mr. S. F. Edge has recently had completed for his own use. The vehicle, as will be seen, is fitted with an exceedingly small and light body, the reason for this being that in view of Mr. Edge's twenty-four hours' prospective run on the Brooklands track he is doing a large amount of driving, and naturally wishes to do it with the minimum amount of tyre expense. The car is not only light by virtue of its body, but it will also be noticed that the frame itself is cut out wherever possible. In other respects it is on standard lines. The road wheels are of Pugh's detachable wire type, so that if tyre troubles are experienced at any time, it is only the work of a minute or two to change either the front or back wheel, as the spare wheel fits on either of the hubs. In our opinion the appearance of the wire wheels in this car makes it look much better than if they had been

A Napier Six-cylinder "Runabout."

the good state of the roads, and the charms of the county from a touring point of view. Other toasts followed, concluding with a compliment to the hon. sec., Mr. Wilfred Groom, whose rising occasioned hearty applause, testifying to the satisfaction he had given competitors and spectators alike in the organisation of the event.

A NEW process by which steel or wrought or cast iron are rendered rust proof was brought to our notice during the Cordingley Show by Mr. R. Warner, of the London Sherardising Company, Ltd., Hythe Road, Willesden Junction, N.W. This method is particularly useful in the case of motor fittings, springs, &c., and, besides retaining the rust-resisting properties of the ordinary hot-dipped galvanised goods, it is pointed out that the zinc covering is alloyed into the surface of the part "sherardised," and becomes firmly incorporated therewith. Brass or copper thus treated will resist strong sulphuric acid solutions. The coating is an even one throughout, and screw threads are left clean and sharp, and articles that have been sherardised will take a lasting and brilliant polish.

the heavier looking wooden wheels, besides the fact that they are claimed to be stronger and raise less dust. The first illustration shows the car with the hood down and with the small wind screen in a vertical position; the latter can, however, be set at any angle desired. Picture No. 2 shows the mechanic in the act of jacking up the back wheel, as he would have to do in practice to change it. To do this the hub cap is merely unscrewed, when the wheel comes off and the new one fits in place. There is a special locking device preventing the wheel coming off by accident. No. 3 shows the special spanner for screwing up the hub cap, which automatically allows the locking device to come into operation as soon as it reaches the correct spot. No. 4 shows the car with its hood up, and Mr. Edge assures us that he can drive for hundreds of miles in pouring rain and be as warm, dry, and comfortable as in a covered vehicle.

MOTORISTS who repair to Bexhill for Whitsuntide will be pleased to learn that Messrs. L. Russell and Co. will have their spacious garage in Wickham Avenue open during the holidays.

STANDARDISING TYRE AND RIM SIZES.

FOR some time past the French Chambre Syndicale de l'Automobile and the pneumatic tyre manufacturers have been considering the question of standardising the sizes of motor-tyres and rims, with the view of reducing the great variety of sizes at present in use. At a joint meeting of the two bodies recently held it was agreed to recommend the adoption of the twelve sizes shown in the subjoined table. Curiously enough, the Mechanical Branch of the American Association of Licensed Automobile Manufacturers has been studying the same question. At the present time there are said to be no less than twenty-three sizes of tyres in use on motor-cars in the United States. This the Association proposes to reduce to eleven, those decided upon being given below:—

French Standard Sizes.	American Standard Sizes.
700 x 85 mm. } *	28 x 3 in. (700 x 75 mm.)
710 x 90 mm. }	30 x 3 in. (750 x 75 mm.)
750 x 85 mm. } †	30 x 3½ in. (750 x 88 mm.)
768 x 90 mm. }	32 x 3½ in. (800 x 88 mm.)
810 x 90 mm.	32 x 4 in. (800 x 100 mm.)
870 x 90 mm.	34 x 3½ in. (850 x 88 mm.)
815 x 105 mm.	34 x 4 in. (850 x 100 mm.)
875 x 105 mm.	34 x 4½ in. (850 x 114 mm.)
820 x 120 mm.	36 x 4 in. (900 x 100 mm.)
880 x 120 mm.	36 x 4½ in. (900 x 114 mm.)
920 x 120 mm.	38 x 5 in. (900 x 125 mm.)
935 x 135 mm.	

* These fit the same rim.

† The same rim will take both these sizes.

We understand that the difficulty which confronted the American manufacturers was the various sizes of rims on the market, the makers of single piece rims not working to a uniform size diameter and depth of clinch. Through the efforts of the Association they have all, however, agreed to a standard size rim to be inspected and passed by the tyre makers. By a glance at the table it will be seen that the sizes which the French and American associations propose to adopt differ considerably. The idea of standardising tyre sizes is an excellent one, but its utility will be nullified if each country sets up a different series of standards. In view of the great development of automobile touring, the matter, if it is to be taken in hand thoroughly, appears to us to be one which calls for an international agreement, and we would venture the suggestion that both of the bodies above mentioned should defer the definite adoption of the proposed standard sizes, and that a deputation from both should meet in Paris or London—when British motor tyre manufacturers might be invited to join the movement—during the coming summer to decide upon a uniform range of sizes.

MR. J. MEIKLE, of Messrs. R. A. Munro and Co., of Glasgow, has been advocating the use of "Scotch oil"—a mineral oil with a specific gravity of .950—by motorists. He believes it could be delivered in London at 3d. per gallon.

MR. ERNEST ESDAILE, of 124, Birchanger Road, South Norwood, has been asked to give evidence before the Royal Committee of Inquiry into Indian Railways as to the utility of commercial motor-cars as feeders to the railways and as to their usefulness for the collection and delivery of goods. Mr. Esdaile, who has motored many miles in the East, should prove a valuable witness, and any of our readers who have views on the matter should communicate with him.

FROM Messrs. Angus Murray and Sons, of the Craigton Engineering Works, Glasgow, comes a copy of the catalogue of "Atholl" cars—the latest addition to the list of British automobiles. Two models of live axle vehicles are being made, 25-h.p. four-cylinder and 12-h.p. double-cylinder. The change-speed gear is of a patent type, all the pinions being disengaged on the top speed, which is a direct drive. The engine and other parts of the mechanism are all made in Messrs. Angus' own works, and, being standardised, are turned out on the interchangeable system.

SALFORD is to be provided with a motor ambulance.

PRACTISING on the Isle of Man course begins on the 10th inst.

MR. S. A. JONES has a garage on the River Road, Littlehampton.

A NEW motor depot has been opened at Dunblane by Mr. W. A. Mackenzie.

A MOTOR-GARAGE is attached to the Bridge House Hotel at Staines, of which Mr. T. Taylor is the proprietor.

THE county of Buckinghamshire has received £269 in twelve months as fees for the registration of cars and motor drivers' licences.

THE final run of the 40-h.p. Siddeley car trial took place last week, when a total mileage of 10,003 was reached, 7,089 of which were run without an involuntary stop.

LADY PAGET has just taken delivery of a 28-35-h.p. Isotta-Fraschini, fitted with the largest and most comfortable limousine body which Messrs. Hall, Capris and Company, Ltd., have so far turned out.

IN view of the growing demand for motor-cars in the Argentine Republic, it may be of interest to British motor-car manufacturers to learn that it is proposed to hold a motor-car exhibition in Buenos Ayres in October next.

MESSRS. GEORGE POLKEY, LTD., of Birmingham, have issued a pamphlet of illustrations of ship lamps, in which we notice motor-boat lamps are included. These are evidently designed with the same care and thought that is indicated in the firm's lamps for cars.

THE accompanying illustration depicts the 40-h.p. six-cylinder Iris car which was recently driven from London to Madrid, where it is now being exhibited by Iris Cars, Ltd. A start was made at 8 p.m. on Saturday, the 27th ult., in time to catch the night boat at Newhaven. There was no intention of creating a record on the trip, which was made under touring conditions, by Mr. H. Clifford Earp. Bordeaux was reached on the evening of the 29th ult., and Madrid, 960 miles, at 3 p.m.

on Thursday, the 2nd inst. Only brief telegrams have been received concerning the run, but it is satisfactory to learn that both the car and the Palmer tyres, with which it was shod, went through without any trouble of any sort, notwithstanding the poor quality of the Spanish roads. We may add that the body of the car, which was built by Messrs. Alford and Alder, is painted white, which, in combination with light green upholstery, makes a very handsome vehicle.

ACCORDING to the "Indian Motor News," the number of motor-cars running in Calcutta has now reached 500; in Bombay there are over 800; on the other hand, Madras is said to have only thirty.

BARON CASTLEMAINE, D.L., J.P., Lieutenant of Westmeath, has just ordered a 24-h.p. Deasy car.

A NEW safety starting handle for use in connection with petrol cars has been put on the market by the Crown Patents Company, of Bank Parade, West Kensington, W.

THE municipal authorities of Boston, U.S.A., have purchased five Reo cars for the use of those of its officers whose duties take them into comparatively outlying parts of the city.

AMONG suburban motor engineers who are favourably located for attending to the wants of motorists when mishaps overcome them are Messrs. C. A. Robinson and Co., of the Parade, Streatham—on the main London-Brighton road.

THE block of buildings at the junction of Hope Drive with Castle Boulevard, Nottingham, has been taken over by Humbers, Ltd., and will be fitted up as a modern garage, space being reserved for local private users as well as for visitors to the city.

A 30-H.P. six-cylinder Brooke car has just completed a 1,000 miles long distance trial, the daily journeyings having been as follows:—London to Stamford, *via* Brighton, 193 miles; Stamford to Newcastle, 184 miles; Newcastle to Edinburgh, thence to Berwick, 180 miles; Berwick to Doncaster, 175 miles; Doncaster to London, 162 miles; London to Worthing and back, 112 miles.

WE illustrate herewith the Washburn pressure gauge, a device for use in connection with tyre inflators, hailing from

America, and which is being introduced into England by Messrs. Markt and Co., City Road, E.C. The gauge, which is made entirely of metal, and cannot get out of order, is a combined swivel and right angle connection and safety valve, which can be used on any style or size of pump. It is so constructed that it has simply to be set at the number of pounds pressure wanted, and when this is obtained no more air will go into the tyre, but pass out through the gauge, making a sound so that the operator will readily understand he has obtained the pressure desired. The gauge is numbered from 60 to 110 pounds, and one of its features is that the amount of pressure is given at the valve of the tyre, and not at the base of the pump.

MOTORISTS generally will be interested in the half-yearly bargain list of the Motor House, which contains

particulars of several good lines in accessories, tyres, and clothing, to be disposed of on the favourable terms usually associated with this establishment in the Easton Road, N.W.

A CATALOGUE of the lamps and horns for motor-cars made by the Rejna-Zanardini firm, of Milan and Turin, for which Mr. C. F. Bertelli, 1, Albemarle Street, W., is the London agent, is to hand. The lamps are well constructed, from the scientific as well as from the mechanical point of view, securing employment of all the luminous rays where wanted and doing away with the aberrations that sometimes occur. Illustrations are given of the Zanardini spherical parabolic projectors with central lens, the spherical lenticular projector and other good patterns of these lamps, which have quickly attained a wide popularity in this country.

A LITTLE booklet which should prove useful to all motorists—in fact, to all who have to do with motor-cars—is that which has just been issued by the Aston Motor Accessories Company, Ltd., Aston Lower Grounds, Birmingham. The work, which has been prepared by Mr. F. de Veulle, has for title "AMAC" wiring diagrams, and comprises a series of diagrams showing the ignition wiring arrangements for single and multi-cylinder motors for both accumulator and magneto (high and low tension) ignition and for combinations of both of these. The Aston Company inform us that they will be glad to send copies of the little book to any motorist on application.

MR. HENRY GARNER has recently made very extensive alterations to his garage on the main London and Holyhead road at Nantwich, and will be pleased to render assistance to any motorist touring in Cheshire.

AMONG recent purchasers of Napier six-cylinder cars are Admiral Sir A. K. Wilson, V.C., C.V.O., K.C.B., Commander of the Home Fleet; Mr. Hudson E. Kearley, M.P.; General Milo Spitzer and the Rt. Hon. Sir Gorell Barnes, President of the Probate, Divorce and Admiralty Divisions, the latter's vehicle being a 40-h.p. landaulet.

MR. K. OKURA, who is the owner of a 120-h.p. and 30-40 h.p. Fiat, has just purchased a six-cylinder car of the same make for his father, Mr. K. Okura, of the well-known Japanese firm, Okura and Co., Tokyo, engineers and contractors to the Imperial Government of Japan. It is interesting to note that the vehicle, which is to be shipped to Japan very shortly, is of exactly the same type as the one which was recently supplied to the King of Spain, the first Royal personage to take delivery of a six-cylinder car.

DR. EHRKE, of Kempsey, Worcestershire, writes:—"I think it may interest you if I report one of the many non-stop long distance runs I have done on my 8-10-h.p. Talbot. I left Worcester at 10.40 a.m. on a recent Monday morning, and went *via* Warwick, Northampton, Bedford, Cambridge and Newmarket to Norwich, arriving at 5.15 p.m., without a stop of any sort, and without alighting from the car, a distance of 177 miles in 6 h. 35 min., that is to say, at an average speed of over twenty-seven miles per hour. I returned to Kempsey (181 miles) two days later without stopping the engine, only alighting to put on a Stepney wheel."

M. BAUDRY DE SAUNIER'S "Annual," a copy of which has just reached us, is one of the most complete and up-to-date encyclopædias of automobilism yet published. The volume, which extends to close on a thousand pages, is arranged in dictionary style, and contains, in addition to biographies of the principal automobilists of Europe, paragraphs relating to every subject in which a motorist is interested, addresses of motor-car builders, agents, members of the Automobile Club of France; in fact, it is practically an "Enquire Within upon Everything," so far as automobilism and motor boating and aeronautics are concerned. The book has been compiled by M. Baudry de Saunier, and is published by M. Hubert Baudry, 20, Rue Duret, Paris.

THE following is a report from one of the passengers on the Hotchkiss six-cylinder car which is now undergoing a reliability trial of 10,000 miles throughout Great Britain, and which lately finished a 6,200 mile non-stop run in France. The first run was to Newark, a distance of 126 miles, on Monday, the 29th ult., and nothing worse happened than the meeting of a severe hailstorm near Stamford. Nottingham (155 miles) was visited on Tuesday, a run to Buxton and back (171 miles) formed the programme on Wednesday, 167 miles were covered on Thursday, and 147 miles on Friday. The runs were all non-stop, and the tyres fitted to the removable rims have given no trouble. The car stayed at Leicester over the week end, when a move was made to Leeds for three nights, and thence to Newcastle for the rest of the week.

IN addition to handling the Mascot and Zusta cars, the Farman Automobile Company, Ltd., do a large garage business at their extensive premises in Long Acre, W.C., and also, what is not generally known, an extensive trade in spare parts for cars of different makes. The managing director, Mr. A. Pereno, recently showed us over this department, and we were surprised at the large stock that is kept on hand. Spares for Panhard, Darracq, Clement, Mors, Argyll, Mascot, Zusta, and other well-known makes have each their separate nests of bins and cupboards, so that motorists' requirements can be met with dispatch. Another department in which a rapidly-increasing turnover is being recorded is that of accessories, a large stock being kept on hand of all the leading makes of tyres and non-skids, acetylene and paraffin lamps, &c. Altogether this old-established concern is keeping well to the front in catering for the multifarious requirements of automobilists.

CONTINENTAL NOTES.

The A.C.F. Grand Prix Race.

A good deal of practice is now being put in on the Grand Prix course, among those who have driven round it during the past week being Messrs. Edmond and Richez, on Renault cars, Messrs. Brasier, Baras, and Barillier, on Brasiers, and Messrs. René de Knyff and Heath, on Panhards. The three racing cars which Messrs. Renault have built for the event have been on the road some little time, and have been subjected to several trial runs. In general appearance they closely resemble the vehicles which proved so successful in last year's event. The four-cylinder engines, which are 165 mm. bore by 150 mm. stroke, are nominally rated at 100-h.p., but are expected to develop at least 20 per cent. more than this. The familiar type of Renault dashboard radiator is retained, the water circulation being on the thermo-syphon system. Ignition is by Simms-Bosch high-tension magneto, and the lubrication is by pump. The power is transmitted through a leather cone clutch, three speeds and reverse gear-box, with direct drive on top speed to the rear live axle, which is not provided with a differential gear in the usual way—a practice which Messrs. Renault successfully adopted in the 1906 race.

A Moscow-St. Petersburg Race.

As was briefly mentioned in the last issue of the *M.C.J.*, a motor-car race from Moscow to St. Petersburg, a distance of 425 miles, is to be held on the 7th prox., under the auspices of the Automobile Club of Russia. The competitors in the racing section will be divided into three classes:—1, motor-cycles; 2, cars up to 24-h.p., i.e., of a maximum bore and stroke of 100 by 120 mm. for four-cylinder engines; and 3, cars over 24-h.p. The touring category will be merely divided into motor-cycles and cars. The start will be made at two o'clock in the morning, and six controls will be established *en route*, where supplies of petrol, oil, &c., will be available. The official finishing point will be at Tsarskoye Selo, which is twenty kilometres from St. Petersburg. The final part of the route will be covered in procession by all the cars which have arrived by two o'clock in the afternoon on June 8th. The Grand Duke Sergius Michaelovitch is taking considerable interest in the event, the prize fund for which already exceeds £800.

The Kaiser Prize.

The German Government has notified the Kaiserliche Club that the number of competitors in the race for the Kaiser's Prize must be restricted to forty competitors. As a consequence it has been decided to hold an eliminatory contest on the 13th prox. The vehicles which have been entered will be divided into two groups, the fastest twenty in each over two circuits of the course being eligible to compete in the Kaiser contest.

The Spanish Motor-Car Exhibition.

Considerable interest is being taken in the first Spanish motor-car exhibition, which was opened in the Palais de l'Industrie des Arts, Madrid, on Saturday last, by King Alfonso, who arrived *en automobile*. Altogether there are about 100 exhibitors, all the leading French manufacturers, who have given considerable support to the show, having cars on view. Germany is represented by the Mercedes, Benz, and Dixi vehicles; Italy by Fiat, Bianchi, and Diatto-Clement. The British exhibitors of pleasure cars include the Daimler, Napier, Iris, and Austin concerns, while Messrs. Straker and Squire, Ltd., are showing in the heavy vehicle section. The exhibition will remain open until the 19th inst.

The Provençal Small Car Competition.

An interesting competition for light cars was held on Sunday last by the Automobile Club of Marseilles. The contest, which was a combination of speed and regularity, was held on a 30-kilometre course, which had to be covered eight times to give a total distance of 240 kilometres (150 miles). The competitors were divided into four classes: (1) Single-cylinder cars of a maximum bore of 100 mm.; (2) ditto, up to 125 mm. bore; (3) two-cylinder cars, maximum bore 105 mm.; and (4) four-

cylinder cars up to 85 mm. bore; the total weight of the vehicles having to be proportionate to the bore. The classification was on novel lines, as, while every encouragement was given to make good times, regard was also had to regularity. The times were taken for each lap, and the competitors given a number in accordance with their times, the fastest being first, and so on, the positions in the final classification being as given by the total of the numbers allotted for each round. Thus it was possible for a car which ran consistently well to come out better than one which secured leading positions in several circuits and low places in the others. Twenty-four entries had been received, and of these eighteen started, these comprising one each Alcyon, Fouillaron, Laurentia, Delage, Lion-Peugeot, Cottureau, Werner, and Bolide, three Sizaire-Naudins, two De Dions, three Peugeots, and two Demeesters. The winners were:—Class 1, Masse (De Dion), 12 points (time 5 h. 8 min.); Class 2, Romano (Sizaire-Naudin), 11 points (5 h. 54 min.); Class 3, Plaisant (Peugeot), 8 points (5 h. 52 min.); and Class 4, Collard (Peugeot), 11 points (4 h. 14 min.), the latter making the fastest time of the day.

The N.S.A. First-aid Motor Cycles used in connection with the Hamburg Fire Brigade.

The King of Siam's Visit to Europe.

The Siamese Legation in Paris has purchased four Brasier cars for the use of the King of Siam and suite during his visit to Europe. Last week His Majesty motored from Genoa to San Remo in a 25-36-h.p. limousine.

Miscellaneous Items.

According to the "Annuaire Generale de l'Automobile" there are now 31,700 motor-cars in France.—Dr. Stoess, who drove the Horch car to victory in the 1906 Herkomer Touring Trophy Competition, will defend his title and will again drive a Horch in the Trials which will be held from Tuesday, June 4th, to June 11th.—Twenty-two entries have so far been received for the trial of touring cars which is to be held in Denmark on the 26th inst.—Owing to the large number of motor events which are to take place this season it has been decided to postpone the projected automobile relay race from Kiel to Vienna.—It is announced that Hemery will drive a Benz car in the Kaiser's Prize race in Germany.—The entry list for the trial of industrial vehicles which is to be held by the A.C.F. from the 20th inst. to June 10th closed last week with a total of forty-eight machines—forty-two French and six Swiss.—Fifty-two entries, including a Rover car, were received for the three days' reliability trial of light cars which is this week being held by the Deutsche Motorradfahrer Vereinigung.—Eighteen entries have been received for the Swiss heavy vehicle trials which are being held from the 10th to the 14th inst., sixteen of the machines being of Swiss construction, one German and one French.—An Argyll car has been entered for the Criterium de France and Coupe de la Presse events, which are to be held in August next.

CORRESPONDENCE

[Letters to the Editor should be addressed to the office, 87-88, Charing Cross Road, W.C.]

THE SOUTHERN MOTOR CLUB'S COMPETITION.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In the report of the Southern Motor Clubs' competition, on the 27th ult., it is stated that the Malcolm six-cylinder had not gone far when a wire fused, placing it out of the running. I should be glad if you would permit me to say that this is entirely wrong, as the car ran consistently for two circuits and about half another. The car was sent off at Coulsdon, then to Redhill, Godstone, Purley, and back to Coulsdon, and it ran perfectly throughout. On the second round Redhill was reached exactly to the minute; Godstone, half a minute out, Purley half a minute out; and Coulsdon within seconds of the previous round. On the third round I had reached Godstone, taking the course the opposite way round, when the engine began to misfire badly, and overheated, so I had to stop; the fault was with the high-tension wire, which, unfortunately, had fallen on to the rear cylinder and melted the insulation. Owing to this I lost thirty

The Targa Florio Race.—Gabriel on the De Dietrich taking a nasty corner at Cerda.

minutes, but I returned to Coulsdon, completing my third round without further trouble. Considering the car was only on the road the previous evening for three hours, the performance is, in my opinion, excellent. The three rounds represented roughly sixty miles.—Yours truly,

MALCOLM BROOKE.

THE VAPOUR EMISSION COMPETITION.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Like other correspondents, I was astonished to find that the Royal Automobile Club paid little or no attention to the visible vapour due to lubrication, and dwelt almost entirely on the invisible and odourless constituents which resulted from the combustion of the petrol. Nevertheless, these exhaust results are of the very greatest importance and interest, but I think myself that if we could have in each case the brand and tests of petrol used, the results would be of still greater value. Using a spirit distilling at a low temperature, we might find that less hydrocarbon passed into the exhaust unchanged, and again, when using a spirit such as Borneo, which contains a considerable percentage of hydrocarbons of the (tar) benzol series, we might find that the percentage of carbon-monoxide was greater.

In conclusion, I feel very strongly that the Club will not be performing its duty unless it undertakes investigations with the object of enlightening both the motorist and the manufacturer as to the best course to adopt to secure the nearest approach to an ideal composition of the exhaust.—Yours truly,

A. DUCKHAM.

THE COST OF CARS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Adverting to the letter of G. P. H. de Freville, in your issue of the 4th inst., all he says as to quality of the high-priced car may be perfectly true, but would he kindly say why, whilst a railway express locomotive, all of finest material and workmanship, weighing from eighty to ninety tons, may be bought for £4,500 or so, a car of equal quality, and weighing about a ton, costs sometimes as much as £2,000? Making all allowance for the fact that car builders have had to sink a lot of money for experiments which were made years ago, does it not seem that the car builder has a very good idea of the meaning of profit? The market price of the shares of some of the manufacturing companies seems to bear this out.—Yours truly,

W. L. C.

TRIALS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—The letter of Mr. P. L. D. Perry, on page 194 of your current issue, suggests a problem which is still unsolved by the organisers of the trials and tests which are arranged from time to time in the automobile world.

He has a car which is manifestly outside the classification as devised by the committee responsible for the Scottish Reliability Trials. There are other vehicles on the road, and on the market too, which cannot be entered in any of the recognised classes in the trials. They have merits which should be tried; and if their mechanical details are such as to prevent their inclusion in the existing category a new class might be arranged in which vehicles not already provided for could be run and observed—though not allowed to compete for the award.

This would enable every designer to give opportunity for his vehicles to be compared with other types and secure the publicity that should be accorded every new idea in the motoring world. At the same time it would not controvert the present ideas with regard to classification, but would prevent the constant complainings that now occur when a great trial is announced.—Yours truly,

A. E. T.

CHARGING ACCUMULATORS FROM PRIMARY BATTERIES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Anti-Magneto's" query as to the charging of accumulators by means of the Boron battery, I beg to state that I have used a Boron battery for this purpose since last September, and have found the greatest comfort from doing so, as I live about five miles from the nearest charging station. I also find that the accumulators retain their voltage longer than they did. When the first cost is paid off, re-charging by primary batteries costs very much less.—Yours truly,

G. A. L. RAWSTORNE, Lieut.-Colonel.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a chauffeur of over eight years' experience, will you kindly allow me to give "Anti-Magneto" a hint on this subject? I have had entire control of five different cars. One fitted with magneto ignition was the cause of endless trouble and annoyance, and do what I would I could never induce the car to work satisfactorily. I certainly have no wish to renew acquaintance with the magneto system. Of the remaining four cars, all fitted with coil ignition, the accumulators belonging to two were charged from the mains; these cars worked much better than that which had a magneto, though the results were not quite so good as could be desired owing to frequent insufficient charging of and not unfrequent damage to the accumulators at the charging stations. In the remaining two cases the accumulators have been charged by Boron batteries, and the results have been unquestionably more satisfactory than either the magneto or the main-charging system. With the Boron battery and charging under my own supervision, I can not only rely on my accumulators being properly and fully charged but can obtain the best possible result from the cars. I have recently seen a cabinet fitted to a car, by means of which two spare accumulators can be charging while the car is running, a very admirable arrangement.—Yours truly,

SCORCHER.

REVERSING A MAGNETO.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can you or any of your readers let me know how to reverse an Eisemann magneto, as it turns the wrong way?—Yours truly,

W. AULD.

[It is not possible for the ordinary mechanic to reverse an Eisemann magneto in a satisfactory manner, as the rotation would then be in an opposite direction to that for which the make and break is designed. However, if the magneto were only an old one, and the best mechanical efficiency not aimed at, our correspondent could alter the machine by reversing the cam and securing it to the shaft in such a position that the platinum contacts separate immediately after the maximum pull of the magneto is felt, when the armature is rotated in the desired direction.]

The high tension contact pawls would tend to dig into the distributor disc, which would make it necessary to take these off their supports and place them pointing in the opposite direction. Care would have to be taken that the segment on the disc is in contact with one of the pawls when the platinum contacts separate. This adjustment can be made by removing one of the gear wheels and replacing same a tooth or two backwards or forwards as may be necessary. As previously pointed out, however, this is but a makeshift, and for a proper job the magneto should be sent to Messrs. G. T. Riches and Co. or other firms who specialise in magneto repairs.]

TRAFFIC REGULATION ON THE EMBANKMENT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The Thames Embankment is at last becoming one of London's important thoroughfares. For a long period it was but little used by vehicular traffic, but the coming of the motor-car and the rapid adoption of the same by City men quickly wrought a change. If proof of this be needed, one has only to station himself, say, at Charing Cross Railway Bridge between 9.30 and 10.30 a.m., when the number of automobiles that pass by will doubtless cause considerable surprise. The latest addition to the traffic on the Embankment is that of the tramcars, the two lines for which are both laid on the river side of the road. There may have been good reasons for placing the two lines together, but in my opinion it is fraught with danger, as the arrangement has quite upset the ordinary rule of the road. For example, I was driving home on my car from the City the other day, naturally keeping on my own side—the left. I had not gone far before I saw a tram coming towards me at a good speed; I had either to pull in close to the kerb or pass the tram on the

DRIVING CERTIFICATES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The way in which the Royal A.C. maintains its propaganda to secure candidates for its examination is really a very business-like method. Hardly an opportunity is missed, and one wonders sometimes whether the dignity of such an institution is always considered by those responsible for the organisation. I have just received a circular from the Club wherein it is said that "the owner who is in possession of the Club's driving certificate has valuable testimony of his competence to drive, in the event of legal difficulties, and if he wishes to tour abroad with his car, he may obtain a French driving certificate before leaving England, thus obviating the necessity of undergoing an examination in France." Is it really necessary to undergo an examination in France?—Yours truly,

A TOURING MOTORIST.

CIRCUMVENTING POLICE TRAPS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—There is increasing evidence that the police mean to be very busy with their vile trapping system this summer, and no doubt, as before, just on those nice stretches of open road where there is absolutely no danger, and not the least possible inconvenience to anyone. This is very unfair, and more so because it is a well known fact that many motorists who get caught are only running it fine, or, to be more precise, they are running as near to twenty miles per hour as they can estimate, and perhaps not exceeding that speed, but the men with stop watches say 26 miles, 30 or 35 per hour as the case may be, and the

The Inauguration of a Renard Road Train Service at Dejointes (Oher) France.

(La Locomotion Automobile).

wrong side. I have since watched the traffic on several evenings and have found many drivers and numerous cyclists embarrassed as to the right way to pass the approaching trams. I venture to suggest that Scotland Yard or other responsible authorities should issue some regulations with regard to traffic on the Embankment. The sooner it is done the better, as if it is delayed I shall not be surprised to hear that a nasty accident has taken place.—Yours truly,

W. HETHERINGTON.

EXCESSIVE PETROL CONSUMPTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have run a 7-h.p. Panhard for more than two years, and have travelled about 20,000 miles; it is a very reliable car and the gears and engine are still as good as new. The weight is 17 cwt., but I find the petrol consumption excessive. In an ordinary up and down country I get only twelve to fourteen miles out of a gallon. Can you or any of your readers suggest a remedy? The makers can only recommend reduction of spray. This merely reduces power.—Yours truly,

C. R. E. WHEATLEY.

[Panhards take a lot of wearing out, but perhaps this one had seen service before the 20,000 miles our correspondent has driven it. The efficiency of the engine may be somewhat reduced by slight loss of compression, reduced lift of exhaust valves, or want of perfectly correct strength and lift of springs of the inlet valves. As regards the gears there may be a drop in the alignment somewhere, and another very frequent cause of loss of power is chains that are stretched and partly ride on the teeth of the sprockets. If the car has solid tyres, about eighteen miles on a gallon would not be bad for this car, but if it has pneumatics, then it ought to do over twenty.]

result is a heavy fine, much loss of time, and considerable annoyance. Of course, we are aware that it is the law as it stands to-day, but surely it is one of those laws which does not receive much respect, as I know of many who, like myself, go carefully at all times, slowly where necessary, but otherwise as fast as we want to in the open, and we take our luck; of course, making enquiries on the way as to how the land lies ahead. I myself have piled up a considerable mileage, and my first fine has yet to come, although I have had a few near squeaks.

The suggestion I have to make may, to some, appear unworkable, but if carefully thought out could be arranged, and for those touring would prove a real boon.

Let the Motor Union or A.C. keep a register of all police traps throughout the country, and then, any member taking a trip from, say, Sheffield to London, could write asking for information as to dangerous parts, &c., and would no doubt be saved a lot of anxiety, and possibly a few fines. I also think that there would be less risk of fast driving through towns when a motorist knew that he had a clear road further on.

It might appear that there would be difficulty in getting the necessary information for the register, but I do not think so; I am sure all secretaries would take the matter up, and individual members would do their best, even to the trouble of wiring information of any new traps they came upon, or heard of. I think if this system was properly worked, it would soon tire the police of the trapping business.—Yours truly,

JNO. H. HALL.

VAUXHALL MOTORS, LTD., Luton, inform us that they have appointed the Burlington Carriage Company, of 315, Oxford Street, London, W., sole London agents for the 12-18-h.p. Vauxhall cars.

New Combination Petrol-Electric Vehicles.

A NOTABLE feature of the recent Cordingley Show was the display of combination petrol-electric vehicles, in which the power of the engine is transmitted to the rear road wheels by electrical in place of the usual mechanical means. No less than three systems were on view, all making their initial appearance at exhibitions in this country, and comprising many noteworthy features, as will be seen from the appended descriptions.

The Mercedes-Mixte Cars.

Reference may first be made to the MERCEDES-ELECTRIC COMPANY, who had on view a 45-h.p. touring car, Fig. 2, and a 40-h.p. single-deck, thirty-four-seated bus on the Mercedes-Mixte system, which has been developed by the Austrian Mercedes Company, of Vienna. The prime mover in both these vehicles consists of a four-cylinder engine, of the power mentioned above, and located in the usual way under a bonnet in the fore part of the frame. In place of the clutch and gear-box of the ordinary petrol car a small dynamo is mounted on an extension of the crank shaft of the engine, the current generated being transmitted to a lever-actuated controller of the type used on electric motor-cars, and thence by two cables to two series-wound motors, the latter being built up in the hubs of the rear road wheels. The motor shell forms the wheel-hub proper, and is itself formed with a central bearing, receiving the axle upon which the road wheel rotates. Each armature is keyed to the hollowed axle through which the cable is projected and secured

Fig. 1.—The Electric Hub Motor of the Mercedes-Mixte Car, with cover plate removed.

A, Commutator Segments from Armature; C, Collecting Brush Holders; F, Field Windings; S, Hollow Axle, containing Cables, D.

by a nut and lock nut, while around the armature, and solid with the shell, are the fields. These rotate to turn the wheels when the current is transmitted, series fashion, to the armature, the commutator and spider on which the contact brushes are fixed being inside the hub-plate on the outer side of the wheel. This plate is secured by screws, the removal of which exposes the commutator and brushes, which can thus, if necessary, be examined in a very few minutes. Furthermore, either motor can be removed from the wheel with but little difficulty. It is claimed that the motors are able to develop a relatively high power for their size and weight, this being due to the fact that the fields revolve about the armature, instead of the latter rotating within the former, as in the majority of electric motors; the result being a comparatively low tangential for the fields and a high output of power for the current received. In the Mercedes-Mixte system no accumulators are used, and, as the hub motors are independent of each other, this forms another advantage claimed for the system, in that it obviates the use of the usual differential gear, as well as all mechanical power transmission apparatus. The braking system is also interesting. The mechanical brakes, actuated respectively by a pedal and a hand lever, are in no way different from the internal expanding and band types used on ordinary petrol cars. It may be noted, however, that as the pedal brake comes into action it operates a switch which cuts out the current, for the time being, from the dynamo to the motors. In case of failure of the mechanical brakes, an electric brake may be immediately constituted, with the whole power of the petrol motor behind it, by simply reversing the current to the motors from the dynamo by moving the lever to the reverse position. Great hill-climbing efficiency

is claimed for the system, for the engine can be run at its maximum speed, the dynamo and electric motors being designed to take this without being overloaded.

The Hart-Durtnall 'Bus.

The HART-DURTNALL SYNDICATE, LTD., of Luton, attracted considerable attention with an exhibit of a handsomely-finished double-deck petrol-electric bus, Fig. 3, which is of interest

Fig. 2.—The Mercedes-Mixte 45-h.p. Petrol-Electric Car.

owing to the employment for the first time, we believe, on an automobile of a polyphase generator and a polyphase current-induction motor. The object of the designers has been to produce a system of power transmission that shall be both simple and reliable, permanently silent, and one that will require practically no attention as regards maintenance, and also a transmission that will be constant in maintaining high efficiency throughout its life, and made up with the minimum of parts. The motive power is supplied by a 40-h.p. four-cylinder engine, located under a bonnet in the fore part of the frame in the usual way. The

Fig. 3.—The Hart-Durtnall Petrol-Electric 'Bus.

engine is coupled direct to the four-pole polyphase generator, a small 1.5 K.W. series-wound continuous-current exciter and one half of a special magnetic clutch. The spindle of the other portion of this clutch passes through the polyphase current induction motor, a universally-jointed or cardan shaft thence conveying the power through a worm gear drive to the rear live axle. The motor, which has no brushes nor commutators, freedom from trouble on this account being consequently claimed, is fitted with a self-contained rotor; it is only employed on putting the car into motion or on steep hills, for as soon as a fair

rate of speed is attained the magnetic clutch is engaged and the power of the engine is then transmitted direct to the rear road wheels, the generator and motor turning idle, and acting as flywheels. It is claimed that the car can be driven on the direct drive, that is without the intervention of the generator and motor, at as slow a speed as four to five miles per hour, simply by controlling the admission of gas to the engine, the electric system being only called into operation on starting or on climbing steep hills, when the load may be too great for the existing gear ratio. The engine is put in operation in the ordinary way, and as soon as the car is ready to start, the controller allows the small continuous-current exciter on the generator spindle to supply an excitation current at low voltage to the alternator field windings. Polyphase current is thus generated, and is conducted through reverse and two-speed switches

Fig. 4.—Plan of Chassis of Hart-Durtnall Petrol-Electric 'Bus.

A, Motor; C, Generator; D, Clutch; E, Motor; F, Cardan Shaft; G, Differential Gear.

to the stator windings of the motor and thence to the rear axle. As soon as the car gets away, a direct drive is obtained by placing the magnetic clutch winding in series with the field of the generator, which weakens the field, and at the same time brings the clutch gently into contact. As soon as this takes place, a bridge-piece short circuits the generator field, and the exciter then only furnishes current to the clutch windings, which give a firm grip and a direct drive at about twelve miles an hour. Should it be necessary to stop and restart on a steep gradient the two-speed switch is placed in the low-speed notch. This gives increased torque at the road wheels, the engine running at its maximum and the car slowly. When the vehicle is pulled up sharply, the exciter field is short-circuited before the brakes are applied, and in starting off, the exciter cannot pick up again until the driver takes his foot off the brake-pedal, and the band brakes are clear of the drums. The bridge contact then opens up the field, allowing the exciter to build up, and the car starts again. A further feature of the system is a magnetic brake, which automatically comes into operation when

by the engine. The battery is always maintained in a state of charge by the dynamo, and serves, beyond its role of reserve power, for the automatic starting of the engine, for the clutch and the brake, for the ignition, for the lighting, and any other accessory services, such as foot warmers, electric signals, &c. The engine is of 24-h.p., and comprises four cylinders 100 mm. stroke by 100 mm. bore, with mechanically-operated valves, and ignition by make and break contact in the cylinders themselves. The intensity of the spark is varied by increasing or diminishing the self-induction of the induction coil. The water cooling of the engine is on the thermo-syphon principle,

Fig. 5.—The Carburettor with Electro-magnetic Regulation, as employed on the Auto-Mixte Car.

through a radiator with air-inducing fan. The rotary speed of the engine is limited to that imposed by the dynamo, which it drives; the crown of the electric-magnetic clutch, which serves also as a fly-wheel to the engine, is keyed, like the dynamo, on the end of the main shaft. The result of this direct coupling is that the engine never runs at an angular speed above that which corresponds to the speed of the car itself. The dynamo is of the four-pole type with series drum winding and shunt excitation, provided with auxiliary commutation poles with series excitation, which allows the brushes to be placed in a neutral zone and assures a good commutation, even with intense currents and a feeble field, without sparking. The use of auxiliary poles allows of

Fig. 6.—Chassis of Auto-Mixte 24-h.p. Petrol-Electric Car.

descending hills. The 'bus exhibited was driven to the Show from Luton via Dunstable, a distance of forty miles, in just under two hours, on a petrol consumption of 6.667 miles to the gallon.

The Auto-Mixte Car.

Great interest was evinced in the exhibit of the petrol vehicles built on the Henri Pieper system by LA SOCIÉTÉ L'AUTO-MIXTE. The vehicles on view comprised an elaborately-finished limousine, closely resembling in outward appearance a petrol touring car. The design of the machine is on exceedingly novel lines, the general arrangement being briefly as follows:—A petrol engine drives a shunt-wound dynamo keyed on to the main shaft. The dynamo works as a motor or generator according as the E.M.F. is inferior or superior to that of the battery. In the first case it produces an excess of power; in the second it absorbs the excess power supplied

the variation of the angular speed of the dynamo, by the simple shunt variation alone, between 400 and 1,600 revolutions per minute, the same as that of the engine which drives it. The battery consists of twenty-four Tudor cells connected in series and specially designed to supply heavy currents without deteriorating; it can momentarily discharge at 200 ampères, corresponding to eight K.W. with a weight which does not exceed three cwt. Running in parallel it thus adds its power to that developed by the petrol engine. The regulation of the latter is such that it works at full gas admission as soon as the battery gives out current and tends to discharge itself. After the assistance thus rendered the battery automatically recharges itself, with a current which diminishes in intensity as it approaches the state of complete charge, i.e., as its E.M.F. increases. The battery gives about fifty volts, all the electrical parts (excitation, ignition, clutch, brake, and lighting) being designed to normally work at this voltage

The carburettor, which is provided with electro-magnetic regulation, is of the ordinary Longuemare type, the mixture admission valve being, however, controlled automatically by the action of a soft iron core suspended from a spring and placed in a solenoid with two windings. One of the latter, of fine wire, is shunted across the terminals of the battery. The other winding—a series one—is placed in the circuit connecting the dynamo to the accumulators. The tension of the spring, to which is suspended the core, is so regulated that when the accumulators are properly charged the dynamo neither produces nor absorbs current, the petrol engine develops just the necessary power to drive the car, through a cardan shaft and bevel gear, at its regulation speed, and to keep in movement the generating plant so as to supply the small current necessary for the auxiliary services of the battery. The current controller constitutes with the steering wheel and the clutch or brake pedal one of the three organs necessary for the complete control of the car. The position O of the controller corresponds to all the circuits open. Passing from this to position (slow speed) produces successively:—(1) The closing of the exciting circuit of the dynamo on the battery without any external resistance; (2) the placing of the armature in derivation with the battery with starting resistance in series, causing the petrol engine to run under the action of the electric motor; (3) the closing of the ignition circuit; and (4) the short circuiting of the starting resistance. The successive positions from two to twelve correspond to increasing speeds, regulated by the excitation of the dynamo. In passing from one to the other the entire car accelerates itself, and for each period of acceleration energy is taken partly from the battery which drives the dynamo and engine, making it produce the complimentary torque, and partly from the engine, of which the gas admission opens itself fully and causes it to produce its maximum power and thus relieve the battery. The reverse effect is produced when the lever is pulled back. The dynamo at higher excitation works as a generator, and recharges the battery, at the same time closing the gas if the charging circuit tends to become too heavy. Backwards from O the controller has three positions, one for electric braking, one for commencing the reverse motion, and one for running backwards. The electro-magnetic clutch and brake consists of an iron disc, the surfaces of which are face to face to crowns, also of iron, one of which—movable—is fixed on the prolongation of the dynamo shaft, the other being fixed to the frame. Each of these crowns has a magnetising coil in which passes an electric current of an intensity variable by the clutch and brake pedal. The adherence is in proportion to the current, which, very weak at the beginning, allows the plate to slip on clutching. Numerous advantages are claimed for the system in the way of quiet running, efficiency, simplicity of control, &c., and the makers state that with an equal maximum power the chassis of the Auto-Mixte car is no heavier than that of an ordinary petrol car, the weight of the parts suppressed in the latter being equal to, if not more than that of the dynamo and accumulators.

CLAIM AGAINST MOTORIST DISMISSED.

At the Newcastle County Court, Major Chapman has been sued by a vanman for £100 damage for personal injury alleged to have been caused by the negligent driving of a motor-car by the defendant or his servant. The plaintiff was standing in the road of Grainger Street, when he was knocked down by the major's motor-car and badly injured. For the defence it was contended that the car was driven carefully and that the man staggered back on to one of the lamps before being knocked down. This view was urged by Mr. H. S. Mundahl, instructed by Mr. J. A. Williamson, and his honour Judge Greenwell, in giving judgment said:—"The case put forward on behalf of the plaintiff was one which would entitle plaintiff to recover without any possibility of doubt, because nobody travelling along streets in a crowded condition with his eyes open would be entitled to ride down anybody, whether sitting, standing, or lying on the road. The evidence, however, was weightier on behalf of the defendant than that of the plaintiff as to where the plaintiff was, and what he was doing. He (his Honour) took it that plaintiff and his brother were crossing the road, and that they had crossed in front of the car. People who stood about the roadway on a Saturday night must have some responsibility cast upon them; if they were nervous so that they were alarmed, and jumped back when a motor-car or tram passed, and were injured, they had no one to blame but themselves for being in that position when they had not sufficiently strong nerves. It seemed to him there had been no negligence on the defendant's part to justify him (his Honour) in saying he was liable. Judgment, therefore, must be for the defendant. Defendant did not ask for costs.

MESSRS. JARROTT AND LETTS, LTD., have just received a repeat order from Lord Alwyne Compton for one of the new 30-40-h.p. Crossley chainless cars, which is to be fitted with a limousine body, the car being for the use of Lady Alwyne Compton. This is the third Crossley car owned by Lord Alwyne Compton.

THE R.A.C. has issued a certificate with regard to the trial of the consumption of lubricating oil used on a 40-h.p. six-cylinder Napier. The car was recently submitted to a 510½ mile run, divided into three consecutive daily journeys to Southampton, Bath and Daventry and back respectively, during which the amount of lubricating oil used was 1 pint 8½ oz., which is equal to 2,866 miles to the gallon.

A RELIABILITY RUN THROUGH NORTH WALES.

THE open space in front of St. Margaret's Church, Bowdon, presented a very animated appearance between 7.30 and 9.30 on Saturday morning on the occasion of the reliability run of the Manchester Automobile Club. There was much inspecting of the cars to see that tyres were right and engines in order, much filling of petrol tanks, oiling, &c., and general careful preparation for the journey. As one car after another ran up the officials allotted the observers, who had been nominated by each competitor, to the car to which they were to devote their attention in seeing that the rules and regulations were adhered to. Thirty-one members entered their names for the run, and twenty-nine started for a spin of 132 miles through Cheshire and North Wales. It was a new departure on the part of the club, but so much interest has been aroused in it that it is safe to say that it will not be the last. Of the twenty-nine cars that commenced the run twenty-eight covered the entire course, and the defaulting car, through delay from a mishap to the steering, stopped short at Bettws-y-Coed. The principle underlying such a run is that it shall be a test of the reliability and efficiency of the various types of cars entered by the members. Marks were therefore given for reliability, quick starting, and economical consumption of petrol. 1,000 marks were the maximum, made up as follows, 750 for reliability, 50 for starting, and 200 for petrol consumption. Of course reliability involves speed, as well as safety and freedom from breakdowns, but the minimum time of 7 h. 20 min. for the whole journey works out to only 18 miles per hour, and any excess above this speed involved a loss of marks.

The route determined upon by the committee lay through Chester, Denbigh, Pentre Voelas, Bettws-y-Coed, Capel Curig, Beddgelert, Portmadoc, Blaenau Festiniog, Dolwyddelen, and terminated at Bettws-y-Coed Station, thus, while giving the motorists a journey through most varied and picturesque country, satisfying the conditions required for a reliability contest in the highest degree. The numerous towns and villages en route called for the exercise of that restraint and care without which the steerer of the car is liable to find himself involved in unpleasant altercations with the inhabitants or possibly noted by the argus-eyed man in blue; then, again, the narrowness of some of the roads with many twists and turns and the steepness of the gradients were a severe test of the skill in driving and the brake control of the car.

The car on which the present chronicler journeyed started at 8.35, and after passing Northwich, Delamere, and Tarbin, Chester was reached at 10.17. The ancient city is always interesting, though on occasions such as reliability runs the mind is occupied with matters remote from historical reminiscence. Yet the old-world appearance of the place forces itself upon one no matter how flying the visit may be, and we remember in the tranquillity of the country at the end of the day that we have careered on the most modern of migratory inventions through the Roman Deva, where once camped the legions of the Imperial City, and the Norman knights jousted and revelled, or, like Jamshyd, "gloried and drank deep."

At Ruthin the main road was left and a detour made round by Denbigh, thirty miles distant from Chester. The maximum time allowed between the two places was 2½ hours and minimum 1 h. and 40 min., but we covered this stage in the exact minimum time. Its castle forms a good landmark in the approach to the town from Ruthin, and one was almost tempted to stop and enter if only to ascend the stairs and view the famous and beautiful Vale of Clwyd, but there was serious business before us. Our route-book warned us of a road narrow in places with a closed gate to be opened by cottagers, and our previous study of the road had informed us of stiff hills to be negotiated, for we rise from 250 ft. at Denbigh to a height of 1,521 ft. on the Mynydd Hiraethog before reaching Pentre Voelas. We expected to have obtained some fine views of distant Snowdonia as we made our way along this rough, lonely road across the moorland, but a change came over the scene and we were mercilessly pelted with hail, which continued for above half an hour.

At Pentre Voelas we are only some 700 ft. above the sea-level and join the great Holyhead road about seven miles from Bettws-y-Coed, where the first stop can be made, an hour being allowed for lunch. As we moved rapidly along to the halting-place we obtained glimpses, in the breaks of cloud, of the noblest peaks of the district, Snowdon with Moel Siabod to the right, Y Tryfan with its sharp peak, the Glyders, and, further north, Carnedd Dafydd and Carnedd Llewelyn, almost rivalling Snowdon itself.

The second portion of the route was a most severe test of the staying power of the cars, particularly in the hilly district near Blaenau Festiniog and Dolwyddelen, but twelve cars completed the whole run so as to gain the non-stop certificate of the club. The further awards of medals will be made after the calculations necessary have been worked out by an independent outsider to be appointed by the committee.

The following twelve gentlemen made non-stop runs:—Messrs. H. Bright (Argyll); J. Arrowsmith (Horbick); R. Jackson (R. Jackson); F. R. Hesse (Daimler); Joshua Hall (Mercedes); Jos. Makin (Belsize); J. Higginson, jun. (De la Baire); G. J. Crawford (Lanchester); H. P. Barry (Belsize); H. Hollindake (De la Baire); A. E. Growdy (Walsley Siddaley); W. J. H. Steiner (Belsize).

THE demand for the "Garantire" tyres introduced by the Motor House, of Euston Road, N.W., has been so great that we learn the factory is now working night and day to cope with the inquiries.

CLUBS AND ASSOCIATIONS.

ROYAL A.C.

THE Marquis of Breadalbane has just obtained the Royal A.C. driving certificate. A badge will shortly be issued to all who have passed the examination.

The Dust Committee of the Club suggests a competition of a scientific character in the summer.

The entries for the "Graphic" trophy include Mr. J. E. Hutton's 40 and 60-h.p. Berliet and Mr. G. S. Barwick's 35-h.p. Daimler.

Six entries have already been received for the Commercial Vehicle Trials, and at least a dozen other firms have signified their intention of submitting vehicles for trial.

Supplementary regulations have been issued in connection with the "Henry Edmunds" challenge trophy to be competed for at Carter's Hill, Underriver, Kent, on the 8th prox. This competition is restricted to vehicles fitted with engines which comply with the following formula:—Cylinder diameter in inches squared multiplied by the number of cylinders must not exceed 100. On the same day the competition for the Carter's Hill cup will take place, this being restricted to vehicles fitted with engines of which the cylinder diameter in inches squared multiplied by the number of cylinders does not exceed 65.

WEST SURREY

THE annual closed hill climb of the club was held on Saturday, May 4th, at Tunnel Hill, Pirbright, by permission of the Aldershot authorities. The course, of one mile, is of an average gradient of 1 in 25, the maximum being 1 in 9½. The handicap R.A.C. formula and results were as follows:—

CARS OVER 12-H.P.

		Handicap.	Gross Time.	Net Time.
		Sec.	Min. Sec.	Min. Sec.
R. Kirke	24-h.p. Dennis	29 1-5	2 52 4-5	2 28 3-5
F. Houghton	14-h.p. Renault	22	2 59 1-5	2 37 1-5
O. O. Wrigley	28-h.p. Daimler	scratch	2 44 2-5	2 44 2-5
R. W. Buttemer	14-h.p. Renault	17 2-5	3 30 1-5	3 12 4-5
E. E. Pullman	15-h.p. Durkopp	62 2-5	4 27 2-5	3 21
R. Vogan	20-h.p. Simms-Welbeck	5 4-5	3 36 2-5	3 30 3-5
A. King	16-h.p. Rover	2-5	3 39 2-5	3 39

CARS 12-H.P. AND UNDER.

A. C. Tessier	12-h.p. De Dion	57 2-5	3 47	2 49 3-5
R. S. Robertson	6-h.p. Wolsley	59 1-5	4 4 3-5	3 5 2-5
Capt. Lang	10-h.p. De Dion	81 1-5	4 30	3 3 4-5
G. H. Gill	10-h.p. Victoria	34 4-5	3 46 4-5	3 12
Dr. Minchin	8-h.p. De Dion	116	5 43 4-5	3 47 4-5
J. F. Ponsford	8-h.p. Clement	72 2-5	5 8 3-5	3 56 1-5
Col. Fairtlough	12-h.p. Darracq	41 1-5	5 16 2-5	4 35 1-5
Dr. Bond	10-h.p. Argyll	9	6 55 1-5	5 38 1-5

Mr. J. W. Orde acted as judge at one end, Mr. Barker officiating in the same capacity at the other, while the handicapping was undertaken by Messrs. Straight and Ebbelwhite. A picnic tea concluded the proceedings, which were well attended by members of the club, about thirty cars being present.

AUTO CYCLE CLUB.

TWENTY-THREE entries have been received for the international Tourist Trophy Race for motor-cycles, to be held in the Isle of Man during the last week in May. The last day for receiving entries is May 14th.

The following are the entries up to date for the International Auto Cycle Tourist Trophy Race:—Mr. J. Schulte, Triumph (2); H. A. Collier, Matchless (2); Albert Brown, Brown; H. G. Cove, Minerva; C. B. Franklin, J.A.P.; W. D. Coplestone, Peugeot; A. W. Wall, Roc (2); Wm. Williamson, Rex (4); Isle of Man Motor Company; W. H. Wells, Vindec Special; R. W. Ayton; J. D. Hamilton, N.S.U.; J. Schink, N.S.U.; T. Silver, Thomas Silver; Stanley Webb, Triumph; H. Rene Fowler, Norton; and H. Martin, Kerry.

SOMERSET.

THE annual meeting of the above club was held on Saturday, when an "At Home" was given by Mr. and Mrs. Armitage, at Haygrass, Taunton. Favoured with fine weather and good roads a large number availed themselves of the hospitality of the host and hostess.

The chair was taken by Mr. Jackson Barstow, J.P., D.L., one of the vice-presidents, Mr. Armitage being the hon. sec. The annual report and balance-sheet showed that the number of members is 116, an increase during the year of thirteen, and the balance in hand amounted to £141 15s. 9d. The hon. sec. regretted that the size to which the club

had grown, and the extra work entailed, prevented him from continuing in that capacity, and, to the regret of all, his resignation was accepted. The following officers were elected:—President, Sir Wroth Lethbridge; vice-presidents, Mr. J. Barstow, Mr. John Hargreaves, Mr. R. A. Sanders, and Mr. A. Armitage; committee, chairman Mr. A. Armitage, (Taunton), Messrs. Aspinall (Weston), Beauchamp (Stone Easton), Col. Barrett (Taunton), Dr. Benson (Bath), Blake (Bridgwater), Dave (Weston), Elwes (Somerton), Hippisley (Stone Easton), Vaughan Jenkins (Bath), Chester-Master (Bridgwater), Metcalf (Cheddar), and Wills (Bridgwater). The hon. sec. elected for the ensuing year is Mr. R. B. Graves-Knyfton, the Manor, Uphill, Weston-super-Mare.

MOTOR CYCLE CLUB.

DOUBTLESS the attraction of the Frome's Hill meet militated against the number of entrants in the Motor Cycling Club's competition for the "Albert Brown" trophy, which was decided on Saturday. This event is restricted to vehicles mainly of British manufacture, and of a maximum catalogue price of £550. Starting from Slough the route was via Maidenhead, Henley, Oxford, High Wycombe, Beaconsfield, Farnham Royal, and back to Slough—a distance of about seventy-five miles. In the afternoon a second trip over the same course but in the reverse direction was included in the run. The regularity of running and petrol consumption test based on the total weight carried were factors in arriving at a decision.

In the end the winner was Dr. H. A. Jowett on his 8-h.p. Rover, while non-stop runs were also made by Messrs. J. S. Harwood, J. Platta-Betta, and F. J. Jenkins—all on Rover cars.

NORTH-EASTERN AUTOMOBILE ASSOCIATION.

THE usual monthly meeting of this association was held in Newcastle last week, when there was a good attendance of members, Capt. H. Streatfeild being in the chair. The question of the Ragpath

Profile of Ragpath Hill.

hill climb was fully discussed and it was decided to make this an open event this year under the rules of the R.A.C. The following were appointed a committee to make local arrangements, viz., Dr. McHaffie, secretary, G. S. Barwick, W. Haggie, F. T. Maling, A. N. L. Wood, J. Nattrass, Dr. Buckham, J. D. P. Taylor-Smith and C. R. F. Engelbach, also the chairman and hon. sec. of the Association.

MOTOR YACHT CLUB.

THE first weekly handicap for members' motor-boats will take place to-day (Saturday), on which occasion the one design sailing boats will make their debut on Southampton Water.

The club has been requested by the Nottinghamshire A.C. to assist them in arranging their motor-boat races on the Trent on July 6th, and has consented to do so.

IRISH.

THE Irish Automobile Club has arranged to hold a hill climb towards the end of July, under somewhat novel conditions. The trial is to be on two hills of very different gradients. One contains very steep stretches of road, some being as bad as one in five. On this hill a low geared car will have a distinct advantage, while on the other hill the gradients are much easier, and will give a speedy car an opportunity of showing what it can do there. The cars will be run under the observation of the Irish Club, and no sprockets may be altered or adjustments made during the time. The hills are situate close together, which greatly facilitates the proposed arrangements.

THE MOTOR UNION.

THE membership returns of the Motor Union of Great Britain and Ireland show a record increase for the first four months of 1907. No less than 2,000 new members have been enrolled, or an average of about 120 per week. The total membership of the Union is now between 15,000 and 16,000. The recent developments of Motor Union activity

have also met with striking success. The insurance scheme which came into operation on the 1st of January has received support far in excess of the most sanguine estimates of the Committee. The Motor Union car badge, which has recently been issued, has also met with the approval of the membership. Within three weeks from the date on which their issue commenced over 1,000 had been disposed of. Particulars of a new scheme for protecting the highways of the country and ensuring the safety of the public—in which the co-operation of the local authorities, clergymen, and landowners is to be invited—will shortly be announced.

MR. K. A. STEVENS is forming a motor club for the Straits Settlements.

ON Thursday the East Lancashire M.C.C. held a hill-climbing competition on Sawley Brow.

A MOTOR-CYCLE club is being formed in the Cirencester district, with Mr. W. G. Inward, 3, Corin Villas, Cirencester, as hon. secretary.

AT a meeting of the Committee of Management of the Society of Motor Manufacturers and Traders, the following were elected members:—Elastes Company, Ltd., W. H. Tye, Aster, Ltd., Miesse Petrol Car Syndicate, Ltd., Roseleigh Motor Company, and North Eastern Garage, Ltd.

FOR the convenience of members visiting the Bexhill Races at Whiteside, the Motor Club Committee have secured an option upon a limited number of bedrooms at the Sackville Hotel. All the important roads leading to Bexhill will be specially patrolled by the A.A. during the race meeting.

MOTOR TOURING IN AUSTRIA.

THE American Consul at Carlsbad reports that during last year a large number of automobilists visited this district, in which the well-known Austrian watering places of Carlsbad, Marienbad, and Franzensbad are situated, and as scarcely any owners of cars were acquainted with the regulations in force regarding foreign automobilists, great inconvenience has been experienced. As the number of motoring visitors is likely to be

The 14-h.p. Four-Cylinder Car recently supplied by the Star Company to His Majesty's Government for use on the Gold Coast.

The vehicle is fitted with a specially-designed Cape Cart hood, having storm curtains and glass screen, which entirely protects the whole of the passengers from rough and stormy weather.

even greater during 1907, travellers using automobiles should make themselves acquainted with the legal rules and regulations now in force, because those who do not understand them may find themselves subjected to disagreeable positions and meet with many troubles and annoyances which could be avoided. The following is an extract from the rules and regulations in regard to motor vehicles entering into Austria:—For every automobile passing the frontier, no matter whether the car remains in the country or not, and without any reference to the machine being old or new, or for private use or business purposes, the full custom-house duty levied must be paid in cash if the machine remains in the country, or the amount is requested to be deposited if it is to be taken out of the country. It is very important that travellers should provide themselves with sufficient Austrian money before they enter the empire. A duty must be paid or deposited as follows: for machines weighing up to 800 lbs., £3 per 100 lbs.; from 800 to 3,600 lbs., £2 8s. per 100 lbs.; from 3,600 to 6,400 lbs., £2 per 150 lbs.; and above 6,400 lbs., £1 4s. per 150 lbs. On producing the receipt when leaving the Austrian Empire the money deposited will be returned to the owner. A machine brought into Bohemia may be used fourteen days without restriction. After that time the use is only permitted if it has been subjected to a technical examination by a commission appointed by the chief court of administration at Prague. A tax of 120 crowns (about £4 17s. 6d.) is required to be paid for this examination. Vehicles coming from certain countries with which the Austrian Government has made a special agreement, as for instance Bavaria, Italy or Saxony, can be used without an examination for three months. All persons driving motor-cars in Bohemia longer than eight days must undergo an examination at Prague or Reichenberg to obtain a licence, for which a tax of fifty crowns (about £2) has to be paid. Drivers from Italy may drive three months without any examination

or licence. The speed of a car must never exceed nine miles an hour in towns and villages, or twenty-eight miles on the open road; during a fog, at crossings, curves, and in all places where special care should be exercised, the speed must not exceed three and a half miles. In inland towns and villages it is not permitted to drive with an open silencer.

A QUESTION OF LIABILITY.

IN the Court of Appeal, before the Lord Chief Justice and Lords Justices Moulton and Buckley, the case of Harris v. Fiat Motors, Ltd., has been heard. It was an appeal by the plaintiff from a decision of the Divisional Court.

The defendants had had a motor-car belonging to a Sheffield gentleman to repair, and they despatched it back to Sheffield in charge of a chauffeur named Watts, with instructions that he was not to leave the wheel while on the journey. Watts picked up another chauffeur named Biscoombe whom he knew on the road out, but continued driving the car himself until Grantham was nearly reached. Something had gone wrong with the car, which began to rattle, and Watts asked his companion to take the wheel while he went on to the back seat to ascertain, if possible, the cause of the trouble. While Biscoombe was driving, the car and a van belonging to the plaintiff, Mr. Percy Harris, a Grantham tradesman, came into collision. The plaintiff sued the defendants in the county court to recover damages for injury thus caused to the van. The action resulted in a judgment for the plaintiff, with £80 damages. The defendants appealed, and the Divisional Court ordered the judgment to be set aside and judgment entered for the defendants on the ground that Biscoombe not being their servant they were not liable. The plaintiff appealed.

Mr. English Harrison, K.C., and Mr. H. Walker appeared for the plaintiff; Mr. Montague Lush, K.C., and Earl Russell for the respondents.

The Lord Chief Justice, in giving judgment, said he thought this appeal ought to be allowed. Referring to the circumstances under which Watts gave up the wheel he said it was impossible to argue with any success that Watts was not acting within the scope of his employment when the accident happened. Watts was in charge of the car, and when something went wrong it was in the interest of his employers, and it was his duty to try and find out where the mischief lay. The prohibition given to Watts in the circumstances had no bearing on the case. The defendants were liable, in his opinion, and the verdict for £80 in favour of the plaintiff must be restored. The lords justices concurred. Judgment accordingly with costs.

AUTOMOBILE ACCIDENTS.

ON Saturday evening a pedestrian in Stoke Newington was knocked down and killed by a motor-bus. Later in the evening a similar casualty occurred in Trafalgar Square.

TWO fatalities occurred on Saturday in which motor-cyclists caused the death of pedestrians in Herne Hill and Holloway respectively.

AN inquest was held on Friday of last week on Mrs. Susan Ryder, 48, of 58, Churchill Road, South Croydon, who was killed by a motor-car in the Brighton Road two evenings before. The evidence showed that the deceased was chasing a dog which was frightening some children, when she was caught by the car and knocked down. Mr. Arthur Jacobs, owner of the car, said he was driving at the rate of twelve or thirteen miles an hour. The deceased appeared to hear the motor horn and ran across in front of the car. He put the brakes on hard and the car stopped but swerved round, pivoting on the front wheel. He thought she was struck by the mudguard. Medical evidence was that death was not due directly to the injury, but to shock acting on a fatty heart. The jury returned a verdict of "Accidental death," and exonerated the driver from blame.

A MIDHURST cowman named Henry Albury was cycling up Gravel Hill, near Petersfield, on Sunday afternoon when he was knocked down by a motor-car driven by Dr. Stanley Welby, of Petersfield. The man died afterwards. The man was on his way with his wife to visit some friends at Clanfield. He was zigzagging up the hill when the collision occurred, and being deaf evidently did not hear the motor horn. When the car reached him he suddenly swerved across the road in front of it.

MR. ADNEY PAYNE, the well-known music-hall proprietor, was injured in a motor-car accident on Sunday at Tunbridge Wells. Mrs. Adney Payne was driving the car, when a cyclist suddenly crossed from his own side of the road right in front of the car. If there was a collision Mrs. Payne knew it would be certain death for him, and in trying to avoid him she ran the car right on to the pavement and into a bank. The two near-side wheels came right off and the car overturned. The two friends who were passengers and Mrs. Payne were not badly hurt, but Mr. Adney Payne was very much cut about the head.

A 45-h.p. four-cylinder Mercedes standard touring car, driven by Mr. A. G. Brown, has, we are informed, just beaten the London to Monte Carlo record by 4½ hours, the total time being 29 hours 20 minutes. The car was timed by Mr. Stenson Cooke, on its departure from the Motor Club, Coventry Street, Piccadilly, W., at 8.25 a.m., on Wednesday, the 1st inst., and according to a telegram received by Messrs. Ducros Mercedes, Monte Carlo was reached at 1.45 p.m. the next day.

CASES UNDER THE MOTOR CAR ACT.

IN REGENT'S PARK.

At Marylebone, a batch of summonses against motor-car drivers for exceeding the speed limit of ten miles an hour in the Regent's Park have just been dealt with. Among the defendants was Herbert Horwood, who was understood to be chauffeur to the Chancellor of the Exchequer. He was accused of driving at a speed of twenty-two miles an hour, and his only remark in answer to the summons was, "This is the renowned trap." Mr. Plowden imposed a penalty of £3, with 2s. costs. Lord Alexander Thynne was also summoned for driving at the rate of twenty-five miles an hour in the Regent's Park, but did not appear. Mr. Plowden imposed a fine of 20s. and costs.

EXCEEDING LEGAL LIMIT.

Several motorists have just been fined at Alton (Hampshire) for exceeding the legal limit. Similar batches of alleged offenders have also been before the Arundel bench.

A MATTER OF ENDORSEMENT.

Several motorists have been summoned this week before Mr. Marsham, at Bow Street, for driving motor-cars in St. James's Park at a greater speed than ten miles an hour. After hearing the evidence, Mr. Marsham said he intended to convict, but he adjourned each case pending an appeal which has been made to the High Court against his decision that convictions of this kind, under the Parks Regulations Acts, must necessarily be endorsed on the offenders' licences. Mr. Marsham said it was a point that ought to be decided, and he had frequently offered to state a case.

MOTOR CYCLING RECORDS.

THE Bohemian Motor Club held a motor-cycle race meeting at Canning Town on Saturday, when C. R. Collier proved successful in

those who join in will have a charming time. By the way, it is just as well to write early for hotel accommodation to Mr. Godfrey Lowe, St. Catherine's, Lincoln.

The programme of the Motor Union meeting at Lincoln on the 18th is as follows:—11 a.m., meeting of the general committee and official reception by the mayor; 11 a.m., inspection of Cathedral and Castle; 2 p.m., assembly of cars in the G.N.R. station yard; 2.30 p.m., procession to Canwick; 3.30 p.m., gymkhana; 7 p.m., dinner in the County Assembly Rooms, Lincoln.

ROAD REPORTS.

CUCKFIELD.—The Urban District Council of Cuckfield is doing much useful work in connection with tarring the roads in its district.

NEWHAVEN.—The Newhaven Rural District Council consider that the grant of £85 last year by the County Council for the upkeep of the Lewes to Newhaven road was entirely inadequate. During the manœuvres the Council spent £537 on it. Deducting £130 paid by the military authorities, £427 was left to be contributed from the rates. They are reminding the Council that the Lewes to Newhaven road is on the main motor way to France via Newhaven and that it has considerable automobile traffic.

STOATS NEST.—The Brighton road in the neighbourhood of Stoats Nest was on Saturday last in anything but a satisfactory condition, several patches of unrolled new metal having been left for the benefit of the week-end traffic.

KILMARNOCK.—A public inquiry is being held at Kilmarnock with reference to an application from the Town Council for the restriction of the speed of motor-cars to ten miles per hour in certain roads. Mr. George Rennie, Glasgow, in giving evidence for the objectors, stated that he had timed the Corporation trams over measured distances,

The Start at Slough for the Albert Brown Trophy Competition. The Event was won by Dr. Jowett, whose 8-h.p. Rover is seen in the foreground. [Photo by] [E. W. Ashworth.]

numerous events, and also beat the one mile flying start record for 76 by 76 mm. machines. The previous record was his own, 65 3-5 sec., and on Saturday he covered the distance in 64 1-5. Collier rode three matches against the Irish champion, C. B. Franklin, winning all three. In the one mile match Collier beat his opponent by 150 yards in 1 min. 30 2-5 sec.; in the three miles he won by a few yards in 4 min. 13 4-5 sec., and in the five miles he passed Franklin in the last lap and won by a couple of lengths in 6 min. 55 3-5 sec. C. R. Collier also won the five miles scratch race in 5 min. 46 1-5 sec., C. C. Bennett being second, and J. Perkins third. Bennett won the five miles handicap, with 25 sec. start, in 6 min. 2 1-5 sec. D. H. Clark, 35 sec., was second, and C. R. Collier, scratch, third. The three miles tourist handicap fell to H. A. Collier, 10 sec., in 4 min. 19 sec., W. W. Genn, scratch, being second, and S. Webb, 15 sec., third.

THE MOTOR UNION AT LINCOLN.

THOSE who participate in the Motor Union meet at Lincoln on the 18th should make a point of taking part in the tour arranged for the following day. The route is via Horncastle to Somersby and Tennyson's country and The Wolds, and then on to Harrington, South Ormsby, Calceby Ruins, Skeddleby and Partney to Spilsby, where Franklin was born, and where there is much to see, then on to Keal, for the fine view over the Fens and to the Norfolk coast, Revesby, Scrivelsby (the town of the King's champion), Tattershall Castle and Woodhall Spa. In this run there is some of the most beautiful scenery in the county, and

and on the Hurlford Road he found them going at the rate of 15.1 and 15.4 miles an hour, and between the Cross and Riccarton at 14.5, 14.7, 13.8, and 14 miles per hour, and from the George Hotel to Beansburn at fifteen miles an hour.

PERTHSHIRE.—The inquiry with regard to motor-car traffic in Perthshire has been resumed before the General Superintendent to the Local Government Board. The Central district of the county want eight roads closed to motor traffic and the Western district six, though neither has been able to show that any accident has occurred on any of these highways.

TUNBRIDGE WELLS.—There is a large and increasing amount of through motor traffic on the principal main roads including the St. John's Road, Mount Ephraim, Pembury, and London roads en route to Brighton, Eastbourne, Hastings, and other South Coast towns. The roads are maintained in a good state of repair, and well scavenged, thus minimising the dust nuisance, which has received much attention. The Corporation were the first to use oil gas tar for dustlaying, which was successfully employed several years ago, and has since been used by several other public bodies. This year the St. John's Road for a length of 600 to 700 yards is being widened to 60 ft. and laid with slag tar macadam. Several miles of the London road, Mount Ephraim, and Langton roads are also to be treated, as soon as the weather permits, with tar by means of the "Tar-Spra" machine, and by the "Laissailly" apparatus. The High Street Bridge, which was formerly narrow and congested, has been rebuilt and very substantially widened and will be opened by the Mayor on the 16th inst. Mr. W. H. Maxwell, A.M.I.C.E., is the Borough Surveyor.

FORTHCOMING EVENTS.

MAY.

SATURDAY, 11TH.

R.A.C. examination at Leicester.
 Meet of the Derby and Wolverhampton A. Clubs at Lichfield.
 Run of the East Surrey A.C. to Old Ship Hotel, Brighton.
 Opening meet of the Ipswich and East Suffolk A.C. at Clacton.
 Nottingham A.C. meet on the Welbeck track.
 Aero Club ascent at the Crystal Palace.
 Auto Cycle Club's open hill climb at Fernhurst.
 Manchester A.C. run to Haddon Hall.
 Speed judgment competition of the Walthamstow M.C. at Ongar.
 Speed judgment competition of the Junior A.C.

SUNDAY, 12TH.

Southend M.C. run to Burnham on Crouch.
 Cardiff M.C. run to Whitechurch and Raglan.
 North London A.C. run to Hockliffe.
 Run of the Birmingham M.C.C. to Great Witley.
 Run of the Junior A.C. to Aston Clinton.

TUESDAY, 14TH.

Meeting of the Roads Improvement Association.
 Entries close for the International Auto-Cycle Tourist Trophy Race.

WEDNESDAY, 15TH.

R.A.C. examination at 119, Piccadilly, W.

FRIDAY, 17TH.

Motor C.C. run from London to Edinburgh.

SATURDAY, 18TH.

Motor Union meeting at Lincoln.
 Entries close for the R.A.C. "Graphic" Trophy.
 Cleveland Branch Yorks. A.C. run to Hutton Hall.
 Meet of the New Forest A.C. at Beaulieu.
 Southern M.C. run to Cambridge and thence to Lincoln.
 Southend and District M.C. tour to France commences.

SUNDAY, 19TH.

West Essex A.C. run to Newmarket.

MONDAY, 20TH.

Crystal Palace A.C. race meeting at Bexhill.

WEDNESDAY, 22ND.

Tar spreading machine and tar preparation competitions.

LIGHTING-UP TIMES—LONDON.

11th—8.35	...	13th—8.38	...	15th—8.41	...	17th—8.44
12th—8.36	...	14th—8.39	...	16th—8.42	...	18th—8.47

THE ROYAL NORTH OF IRELAND YACHT CLUB.

THE annual motor gathering under the auspices of the Royal North of Ireland Yacht Club was carried to a successful issue on Saturday, at Cultra, Co. Down. The following are the details:—

CLASS A.

		Min.	Sec.	
Mr. H. C. Craig	28-36-h.p. Daimler	1	5 2-5	1
Mr. J. Cunningham	30-40-h.p. Daimler	1	55 2-5	2
Mr. S. P. Corry	30-h.p. Hamber	1	2 2-5	3

CLASS B.

		Min.	Sec.	
Mr. G. Craig	15-22-h.p. Daimler	1	7 4-5	1
Mr. R. E. Workman	14-22-h.p. Germain	1	17 2-5	2
Mr. W. C. Mitchell	15-20-h.p. Panhard	1	27 3-5	3

CLASS C.

		Min.	Sec.	
Mr. R. Workman	12-h.p. Darracq	1	48	1
Mr. V. Craig	8-10-h.p. Swift	1	34 3-5	2
Mr. C. W. Cookson	8-h.p. Rover	2	9 3-5	3

SCOTTISH RELIABILITY TRIAL, 1907.

THE following additional entries have been received:—William Turner (Imperial), Capt. Theo. Masui (Germain), Northern Engineering and Manufacturing Company (Spyker), Sternberg and Eason (Buick). The entries at ordinary fees close on the 14th inst.

THE "Wescot" overall, for use in garages, &c., is being placed on the market by the Engineers' Universal Supply Stores, of 25, Sumner Street, Southwark, S.E.

THE Swift Motor Company, Ltd., have sent us a copy of the new catalogue they have just issued. It gives particulars and illustrations of the various models of Swift cars—9-10-h.p. two-cylinder, 10-h.p. three cylinder and 12-14-h.p. and 18-24-h.p. four-cylinder. Four pages are devoted to useful information on the handling and care of the Swift vehicles, while a useful feature is the inclusion of a large and clearly marked illustration showing the parts which need lubrication.

COMPANY NEWS.

NEW COMPANIES REGISTERED.

FILMER AND COMPANY.—£2,000. Manufacturers of, dealers in, and letters to hire of automobiles, motors, &c. First directors: Messrs. C. C. Filmer and S. F. Sharp. Middle Row, Maidstone.

SKINNER AND COMPANY.—£8,000. To take over the business of jobmasters, manufacturers of and dealers in automobiles, &c., carried on by Skinner and Company, Ltd. (in liquidation), at: Hastings and St. Leonards. First directors: Messrs. F. G. Tyrrell, G. H. Swatland, H. A. Fuller, H. A. Pearch, and W. Parks (managing director).

ARGYLLS SHEFFIELD, LTD.—Registered with a capital of £6,000 to adopt an agreement with Argylls Motors, Ltd., relating to the appointment of the company as selling agent for Sheffield.

VIVINUS AGENCY COMPANY.—£10,500. To acquire the exclusive rights to buy and sell the Vivinus motor-cars in the United Kingdom and British colonies, and with a view thereto to acquire the rights conferred by the liquidators of Les Ateliers Vivinus Société Anonyme under an agreement dated April 17th, 1907.

IDEN MOTOR COMPANY.—£10,000. To acquire the business carried on by Mr. G. Iden, at Coventry, as the Iden Motor Company and the Parkside Engineering Company. First directors: Messrs. G. Iden, R. E. Skipwith, and F. O. Wright.

ARMY MOTOR RESERVE.

In the Army Orders for May the full dress to be worn by the Army Motor Reserve is given as follows:—Forage cap: Olive green, band of dark green cloth, gold cord round crown, peak embroidered as for infantry field officers. Tunic: Olive green cloth, collar and cuffs of dark green cloth, ornamented with $\frac{1}{2}$ in. gold lace and Russia braid, as for infantry of the line, eight buttons in front. Sword-belt: Gold-laced on dark green Morocco leather. Shoulder-belt: Gold-laced 2 in. wide on dark green Morocco leather, gilt buckle.

PUBLIC MOTOR SERVICES.

TRIAL trips have taken place of the motor-buses which are to establish a passenger service between Stranraer and Drummore.

A MOTOR-OMNIBUS service is being established by the Great Western Railway Company in the Llandysul district.

A SERVICE of motor-buses is about to be started in the Glossop district.

SOME new single-deck motor-buses are to be put on the Harborne route at Birmingham.

AN average of three motor-cab drivers are now being licensed every day by the Scotland Yard authorities.

A SUGGESTION for the formation of a motor-bus service between Midhurst and Haslemere has been made at a meeting of the local Ratepayers' Association.

POLICE TRAPS.

HALIFAX, Huddersfield, and Bradford now possess their police traps for the capture of motorists.

A NEW trap has been set up by the police in the Lancaster district. This is on the Burton road, the finish of the measured distance being at the junction of the Burton and Milnthorpe roads. The trap has one cross road in it.

THE trap at Carnforth, Lancaster, is again in full working order.

BUSINESS NEWS.

THE CARLTON GARAGE, LTD., have removed from New Burlington Place, Regent Street, S.W., to larger premises in Great Central Street, Marylebone Road, N.W.

THE performance of the Elastes-filled tyres on the 40-h.p. Siddeley car, which has just finished a long distance reliability trial, and which reached a mileage of over 10,000, is excellent testimony to the hard work to which it is possible to subject the tyres. It is noteworthy, too, that the car has never had a road stop during the whole time of this trial through tyre troubles.

TURNER'S MOTOR MANUFACTURING COMPANY, LTD., of which Mr. J. Burns Dumbell is the managing director, inform us that they are in no way connected with the petrol car now being marketed by a syndicate in the title of which the name Miesse occurs.

MR. H. G. NORRIS, until recently manager of Aries, Ltd., informs us that he has just taken over the management of Itala Automobiles, Ltd.

A GOOD deal of attention is now being devoted by motor manufacturers to the development of the automobile movement in Spain, and we are glad to find that British manufacturers are taking steps to secure a share of the trade which is now being developed in that country. During the past week we have received copies of two catalogues of British-built cars, printed in Spanish. The first is that issued so long ago as May, 1906, of Messrs. S. F. Edge, Ltd., describing the Napier cars, while the second comes from Iris Cars, Ltd., and deals fully with the latest types of Iris vehicles. Both lists are got up in excellent style, the text being embellished with a large number of illustrations.

THE Motor-Car Journal.

VOL. IX.]

LONDON, SATURDAY, MAY 18, 1907.

[No. 428.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

COMMENTS.

MATTERS have moved forward since the first repairers were appointed by the Automobile Club in the early days of the movement, and it has frequently been thought that a revisal of the original list might be useful. Recently the subject was brought before the notice of the central authorities by the Northamptonshire Automobile Club, who have suggested that a distinction should be made between the various classes of repairers in the general interest of motorists. The method proposed by the Northamptonshire Club, which has given the matter considerable attention, is that the R.A.C. should decide upon two or three classes of repairers, according to the facilities possessed by the various firms, and that the county clubs should in some measure become responsible for seeing that those people placed on the various lists fully come up to the requirements. We understand that the question of classification of repairers has been deferred for a season, but that meanwhile the Automobile Club has determined to request all the motor firms who were appointed prior to May of last year to apply for renewal of their certificates. In the future local repairers will be required to apply annually for renewal, and it is evident that the R.A.C. intends to thoroughly overhaul the arrangements in this connection.

Motor Ambulances.

THE City of London electric motor-ambulance service was opened on Monday afternoon at the temporary station in the Newgate Street ground belonging to St. Bartholomew's Hospital. During the ceremony of inauguration a test call came from Old Jewry police station. The ambulance was there in just over three minutes, and was back with its "patient" within ten minutes. Sir Alfred Newton, chairman of the Police Committee of the Corporation, presided over the proceedings, and there were also present Sir Edward Henry, the Chief Commissioner, Captain Nott-Bower, the City Commissioner, a large number of representatives of the City Corporation, ambulance associations, and medical men interested in the scheme, which forms part of the plan now being developed in order to bring the ambulance service of the Metropolis to an efficiency that has previously been lacking.

An Irish Note.

JOURNALISTS from the Irish capital, chronicling the gay doings at the Punchestown races the other day, seem to have utilised the motor-car for the purpose of out-distancing each other. One who set out with the idea of observing the roads as well as the people describes how he was not long on the way to Naas—in whose long-streeted town the cars were weighed for the Irish Gordon Bennett race—when he passed the Hon. A. H. Ruthven, whose motor-car had become disabled through tyre troubles. Some distance beyond they were passed by the car of Mr. C. E. Sutton, a leading Dublin solicitor, and then the journalist observed the road. "One thing struck me very forcibly on the way to the course from Naas,"

says this plain-speaking writer, "and that was the niggardly manner in which the roads are made. They are more like boreens than roads, and at many places it is nearly impossible to pass those who are not so fast as you are—in a motor-car. How cars and horses and men and women are not dissected on these miserable flat courses called roads is a mystery to me"—and to others.

In Manxland.

As in previous years, the authorities in Manxland are doing what they can to promote the success of the Tourist Trophy race, and (it may be incidentally remarked) to preserve the lives and property of the islanders. The famous mountain road over Snaefell has been widened at least 4ft., so that the passing of cars will now be possible. Further improvement has been made at the iron gates on the mountain road, and a bad corner cleared away. In the town of Peel, too, the Commissioners are making important alterations for the convenience of the participants in the race. We may add that it has been settled that not only shall the two races be run on the same day, viz., Thursday, the 30th inst., but that the Tourist Trophy cars shall be started first, the heavy touring vehicles following. The distance for the Tourist Trophy race will be six times round the course, with a total of 241 miles 5 furlongs 140 yards, and that for the heavy touring car race will be seven times round the course, with a total distance of 281 miles 7 furlongs 200 yards. This alteration from the Wednesday to the Thursday is made at the special request of the Island's Highway Board. The Auto Cycle Club's Tourist Trophy race will take place on the 28th, and the competition for the "Graphic" trophy will be on the 31st inst.

The Dangers of Petrol.

A RECENT mishap, unfortunately attended by two fatalities, in a London motor depot has drawn attention to the dangers that lurk in the careless use of petrol, and many firms have taken heed of the warning of the coroner's jury against permitting smoking in places where petrol is likely to be about. The subject has also been before the explosives department of the Home Office, who have drawn up a new regulation with regard to the matter. This has been discussed by Captain Thomson, chief inspector of explosives, Earl Russell and Sir Boverton Redwood, with the result that approval has been made of the following brief regulations, the spirit of which, as well as the letter, should be observed by all having petrol under their care.—"In a storehouse, or in any place where a light locomotive is kept, or is present, petroleum spirit shall not be used for the purpose of cleaning or lighting, or as a solvent, or for any purpose other than as fuel for the engine of a light locomotive; provided that, where due precaution is taken to prevent petroleum spirit from escaping into a sewer or drain, and provision made for disposing safely of any surplus petroleum spirit, and where no naked light is present, quantities not exceeding one gill may be used for the cleaning of a light locomotive at a safe distance from any building or much frequented highway, or for the repair of tyres under suitable precautions. This regulation shall apply to premises on which petroleum spirit is kept for the purpose of, or is being used on, light locomotives, whether such

premises are licensed or not, unless the local authority see fit, in the case of licensed premises, to grant an exemption by a special term of the licence."

Registration of Drivers.

THE Automobile Club in London has fostered the scheme for the examination of motor-car drivers; the corresponding organisation in Scotland is now developing what promises to be an excellent plan for the registration of drivers. Only those men who obtain the certificate of the R.A.C. will be considered in connection with employment. Two registers will be kept by the Scottish A.C.: A, of drivers open for employment; B, of the characters of the men who are in the service of members of the club. Thus opportunity will be afforded of assisting capable and well-conducted men to situations, and warning employers against the inefficient and unreliable men who would seek to handle the steering-wheel. The committee are satisfied that in time these registers will become valuable records. They will accumulate the opinions of each successive employer as regards each man registered. In their earlier stages the reports may in many cases have to be applied for from previous employers, after inquiry for them has been made by a prospective employer, but it is expected that the value of the register will become so recognised that the members will

On the occasion of the opening of their new Garage at Brighton last week the Fiat Company took a number of their friends down by road from London. The above illustration shows the party at Crawley.

furnish them as a matter of course. It may also be possible, in cases where the applicant to a member has been previously employed by a non-member, to obtain records for inclusion in the register relative to these, and altogether it should become a great protection amongst members of the Scottish A.C. against unworthy or incompetent servants.

Industrial Alcohol.

MUCH has been written during the last decade with regard to the industrial uses of alcohol, more particularly as to its value as a source of motive power. The report of the Departmental Committee issued some time ago caused a set-back in the expectations of those who looked to alcohol as an alternative for petrol in connection with automobiles, and since then the agitation has been somewhat spasmodic. The publication of Mr. J. G. McIntosh's book on industrial alcohol by Messrs. Scott Greenwood and Sons may do something to revive interest in the matter. The author points out that if this country intends to build motor-cars for the colonies it is very desirable that we should be experimenting with alcohol engines, especially as the high price of petrol would give them a commercial advantage. One of the most serious objections to the use of

alcohol is the extraordinary corrosion which it is alleged takes place. Mr. McIntosh deals very completely with his subject, from the manufacture of industrial alcohol to the plant for its distillation and rectification, as well as its uses in various manufactures. The volume is well illustrated in addition to being well written, and should prove of considerable value to all making experiments in the direction of securing the utilisation of alcohol as an alternative to petrol as a motor fuel.

Motor-car Imports and Exports.

APRIL proved a very active month as regards the importation of foreign motor-cars and parts into the United Kingdom, the returns just issued showing that the number of vehicles which reached this country was no less than 620, their value being given as £228,427. Parts were responsible for an additional £299,071, which gives a total of £527,498—the largest for any one month that has so far been recorded—as against £403,229 in the corresponding month of last year, and £293,903 in April, 1905. For the first four months of the current year the figures are: Number of cars imported, 2,038; value of same, £812,522; imports of motor parts, £879,743, total, £1,692,265. For the similar period of 1906 they were:—2,179 cars of a value of £842,620; parts, £684,671; total, £1,527,291. Turning to the exports of British motor-cars and parts, the number of cars shipped during the four months ending with April was 631, of a value of £248,705; to this have to be added parts estimated at £159,380, which gives a combined total of £408,085, as contrasted with only £199,570 in the corresponding four months of 1906.

A Colonial View.

HIS Excellency the Lieut.-Governor of Victoria, Sir John Madden, who has recently returned from a round the world trip, was entertained by the members of the A.C. of Victoria (of which he is president), vice-president Dr. G. Weigall occupying the chair. The clubroom was crowded, and included amongst the guests were several members of Parliament and prominent public men. Sir John Madden gave a *resume* of his travels, and had some very flattering commendations for the motor-car and motorists. He said the letter to the Royal A.C. secured for him a very pleasant time both in the club and at many outside functions, and he felt very grateful to that body. In Great Britain he said he was able to see from a motor-car considerably more of the sights than would have been possible otherwise. He was there at a time when motor-buses were more odorous than they now are, and described that vehicle to his fellow clubmen in Australia as somewhat objectionable. Mr. Harry Maddox, vice-president, proposed "The Visitors," to which Mr. Norman Bayles, M.L.A., and Chief Commissioner of Police Mr. T. O'Callaghan responded. Altogether a very pleasant and enjoyable evening was spent.

Part of the Entertainment.

IN the years before the suburbs had their present palatial trading establishments, leading drapers were in the habit of providing ordinary 'buses for the conveyance of their patrons. Now the same idea is being developed in connection with modern theatrical enterprises. Mr. Charles Frohman is introducing a novel scheme to suburban patrons of the Hicks Theatre who are desirous of seeing "Brewster's Millions." A private motor-omnibus will on the evenings of Wednesday, Thursday, and Friday next leave the neighbourhoods of Tooting, Wood Green and Lewisham at an advertised hour, and will be at the disposal of patrons of the play, who upon purchasing their tickets will be given a motor-omnibus ticket upon application, provided, we are informed, all the seats in the same have not been allotted. Doubtless the idea will catch on until the provision of motor-buses may suggest to Brewster a new means of disposing of his millions.

**Roads in
Mexico.**

THE influence of the motor-car in connection with the improvement of roads is not confined to countries like our own. Mr. E. G. Westlake, who has lately taken a trip on the "Thomas Flyer" through Mexico, says that although there is not to be a direct Government appropriation for automobile roads for some time on account of the fear that the people will think the officials are fixing highways for their own comfort, there will be no lack of capital to do the work. Already the country club members have contributed enough to make many miles of road. There is a stiff grade of several thousand feet on the Cuernavaca road, involving a climb to a height of 11,000 feet. It will be less than a year, in all probability, when tours to these cities will be weekly features for the residents of the city of Mexico. Six years ago there were deep ditches and causeways leading to the elegant homes in the city where to-day the streets are asphalted under an agreement of the contractors to keep them in first-class condition for a period of ten years.

tions and wealthy with more than an ordinary share of Nature's gifts. And so we hail with pleasure the appearance of Devon in Messrs. Methuen and Company's series of "Little Guides," more especially as the Rev. S. Baring Gould is the author. He knows Devon as well as any man and loves it with a Kingsley-like affection. Among modern men none can write with such knowledge and enthusiasm, and all who intend to tour Devon this year must have the Rev. S. Baring-Gould as their guide. Everyone knows the county is hilly. There is, in fact, hardly a level tract, save in the silted-up portions of the river estuaries. Dartmoor and Exmoor are traversable by car, and the county usually radiant with foliage and flora of varied range, at least three species of flowering plants being peculiar to Devon. The high roads are for the most part excellently made, but badly engineered—the exception to the good construction being in the sandstone region from Crediton to near Okehampton. When the roads were re-engineered at the beginning of the 19th century, instead of being carried along the valley bottoms the old packhorse courses were followed. The result is seen in a

Mr. Roland Hodge, Managing Director of the Northumberland Shipbuilding Company, at the wheel of his new 28-h.p. Daimler Car. The body of the vehicle, which was built by Messrs. Henry Angus, Sanderson and Co., of Newcastle-on-Tyne, is of special design, the rear seat folding up out of the way when not in use. The cushion is, of course, taken off, the two sides hinged down, and the back hinges over the top. The complete set then turns over and it is entirely hidden from view.

In the environs in almost every direction men are at work improving the roads for automobile touring. At Cherubusco the improvements are remarkable, and will be supplemented soon by a half-mile speedway for the private use of the club members. Embankments along the drainage and irrigation canals are to be widened and prepared for touring. Inasmuch as these will afford a hard and almost sun-baked road surface for eight or nine months in the year the value of these roads will be appreciated by tourists.

**A Touring
County.**

THOUGH characterised by narrow winding lanes made famous in song and story, the county of Devon is beloved of the motorist in search of the beautiful. There is a charm in this glorious region that few other English districts possess, and, although guide-books galore already have familiarised the public with its delights, we welcome yet another—for new aspects constantly occur with regard to a county rich in associa-

succession of undulations which would have been quite unnecessary had the roads been lengthened somewhat. Fortunately, however, even the minor cars of to-day can mount the major obstacles of yesterday, so that these difficulties only add to the variety of the journey.

**"The Voice of
the Siren."**

THE phrase "considerate driving" has been prominently before us during the last few years, and has become mainly associated in the public mind with the safety of pedestrians and others. There is another aspect, however, suggested by Mr. F. P. Armstrong, who happens to live on a main road where he is subject to the annoyance caused by the siren and the exhaust cut-out on cars and motor-cycles. This is a matter that motorists should seriously consider, because public opinion is, after all, largely a matter of personal observation, and people cannot be expected to become enthusiastic in favour of that which causes noise and alarm when comparative

peace should prevail. It is understood that the matter is to be brought to the notice of all provincial clubs, and they can do much to prevent a recurrence of the complaint by publishing a warning in their next circulars to members. We shall be glad to hear from the officers of such organisations who take the matter in hand, so that those who are less prompt in their action may be incited to emulation. In the meantime the letter on the subject in our Correspondence columns from Mr. C. D. Rose, M.P., the new president of the R.A.C., will be read with considerable interest and approval.

Where Pace is Slow.

MOTORISTS should remember that at Beverley, Newmarket, Horsham, and one or two other places, regulations are enforced limiting the speed of motor-vehicles and prohibiting their passage along certain roads. Although it was set forth in the regulations empowering such limitations that notices giving particulars of the Order were to be conspicuously displayed, this is sometimes honoured in the breach; or, as at Horsham, by the exhibition of the notice in an obscure and unobtrusive position. Here Middle Street is the thoroughfare where the speed of cars is to be reduced to five miles an hour, and at each extremity of the street is the special sign indicating the regulation. But, owing to the bend of Middle Street, it is almost impossible to see the sign until too late to avoid the lynx-eyed police, who have caught many motorists who have, unwittingly, disobeyed the injunction. The County Council should take steps to place the sign in a better place, so that those who ride may read.

Marine Motorists as Clubmen.

MOTORISTS are the most clubbable of men. Early trials on the road were always accompanied by evidences of good feeling for others, and the development of the motor movement has been marked by a desire for mutual help and assistance that has contributed greatly to its success. From one end of the country to the other organisations are again becoming active, and in the world of marine motoring this is particularly marked. Away at Norwich the Norfolk Automobile and Launch Club combines the movement both on land and water, and its annual dinner, just held under the presidency of Mr. H. L. Clark, was a great success, one of the most interesting utterances in the speech-making being an invitation for the Motor Union to visit Norwich next year. In Scotland a national motor-boating club has been formed from the Glasgow branch of the British Motor Boat Club, and on Saturday the Sussex-Motor Boat Club opened its summer season with a cruise, winding up with tea at the Royal York Hotel and a motor-car drive along the Brighton Front. About fifteen motor-boats took part in the trip at sea.

Meets for Industrial Vehicles.

ONE of the most novel May Day parades that London has yet seen was the procession of commercial vehicles which started from the Thames Embankment a few years ago, and proved to the somewhat sceptical people of those days that the motor vehicle has commercial use as well as pleasurable possibilities. Since then little in that way has been done until recently Mr. Leo Harris and some of his friends organised a similar parade of heavy vehicles. The movement thus inaugurated is now being placed on a permanent basis, and during the coming season some provincial meets for commercial vehicles will take place. The first of these will be held at Reading, on the 15th prox., and the second at Maidstone, on the 27th of the following month. Previous experience has led the organisers of these meets to advise that vehicles should proceed to the meeting place independently, to avoid long processions along country roads. But, arrived at the rendezvous, the vehicles will traverse the respective towns according to a previously arranged itinerary. Subsequently the vehicles will be available for individual de-

monstrations to possible buyers. A committee has been formed, with offices at 379, Strand, W.C., and with Mr. Leo Harris as hon. secretary, to carry out the organisation of the event.

The Irish Trials.

CONSIDERABLE interest is being taken in Ireland in the Reliability Trials, which commence there on Wednesday next over an interesting course. The first day's run will be from Dublin to Portrush, a distance of 150 miles; on Thursday the journey will be back again to the capital over a 168 miles route. The next day's objective will be Waterford, and then on the Saturday the trial will conclude with a return journey, the distance traversed being 563½ miles. The luncheon stops each day will be Newry, Armagh, Glendalough, and Abbeylisle.

A Steam Car Record.

ON Tuesday, the 30-h.p. White steam car, which has been making a Reliability Trial under the official observation of the Royal A.C., concluded its very successful tour. The run of 1,871 miles was an absolute non-stop journey, made all the more interesting by the fact that the route to be covered in the Scottish Reliability Trial was included in the itinerary, thus demonstrating the value of the White car as a touring vehicle. This added testimony to the reliability of the steam car should prove gratifying to Mr. Frederic Coleman, who has seen his car successful both in town carriage competitions and also in a long-distance non-stop run.

DR. BOURNE, the Archbishop of Westminster, is to be presented with a motor-car by his co-religionists in England.

WORKS previously devoted to the manufacture of agricultural machinery at Wickford (Essex) are, it is reported, about to be re-opened by a motor firm.

THE "Bystander" of the 8th inst., which had a capital caricature of Lieut.-Col. Mark Mayhew, of the Army Motor Reserve, reported that twenty-eight Reo motors were sold at the Cordingley Motor Show.

MR. ARCHIBALD FORD's attempt at the 1,000 miles non-stop record run between Manchester and Liverpool on a 10-12-h.p. Darracq car had to be abandoned through the fracture of a small fork actuating the clutch. He had driven continuously night and day for 41 hours, and had covered 694 miles.

DURING the House of Commons debate on the report stage of the Budget resolutions, Mr. Hicks Beach submitted that if the Chancellor of the Exchequer intended to raise an increased revenue from licences on motor-cars he should give the extra amount received to the local authorities responsible for the upkeep of the roads.

MESSRS. SMITH, PARFREY AND CO., of the Pimlico Wheel Works, Hammersmith, have expressed their sympathy with the object of the new Automobile Standardisation Committee, expressing the view that if three or four standard sizes were agreed upon by manufacturers they would be enabled to make considerable reductions in prices for wheels and spare parts.

THE Windham Sliding Detachable Motor Body Company, of Clapham Junction, S.W., have sent us a photograph of a 40-h.p. 1907 Berliet chassis fitted with a Windham patent side-entrance body which is interchangeable with a brougham, built for Sir Henry Norman, M.P., one of the vice-chairmen of the Royal Automobile Club. The bodies have been completed in the short space of about a month from delivery of the chassis, and as Sir Henry Norman is making his wedding tour on the car, it has been equipped in the most complete manner, the fittings including Truffault shock absorbers, Bleriot head lamps, carriage side lamps fitted to the dash, Allen's patent wind screen, a Stepney spare wheel, a double extension hood and side curtains, a disappearing Windham luggage grid, a Jones speedometer, dissolved acetylene lighting, electric horn, side lockers below steps, detachable leather covers over sprockets made on the Windham system, &c. The front wheels are shod with Palmer and the rear with Continental non-skid tyres.

FLEXIBILITY.

WHAT IT MEANS AND HOW IT IS OBTAINED.

THE term "flexibility," as applied to a petrol motor, is one which has come to be very generally used, and is not always employed with an appreciation of what the word implies. In fact, different people at different times use the term with somewhat diverse meanings. An engine which can be run under load without marked unsteadiness at an extremely low rate of speed, and which is also capable of running at a very high speed with load, is said to be "flexible," and a motor which is capable of very prompt acceleration under load without showing signs of distress is also spoken of as being flexible. The first-mentioned capability in an engine permits of the car being driven at very widely varying speeds on the top speed, and practically obviates the necessity of the use of lower gears, the only need of the latter being to secure the additional torque necessary for severe hill climbing. The second-mentioned quality of a motor is expressed by the commonly used expression that the motor "picks up quickly," and it permits of sudden bursts of speed on the level, or of acceleration on hills. Generally speaking, it may be said that flexibility is that characteristic which permits of a motor being worked at widely different speeds and allows of these changes being realised with the utmost promptness.

It may be interesting briefly to review the factors which permit of a wide speed range. First and foremost, the arrangement of the throttling device must be such that, on the one hand, a very slight, uniform amount of mixture may be admitted for low speed running, and, on the other hand, a free and uncontracted supply must be available for high speed operation.

More important still, the quality of the mixture during periods of extremely small demand must be perfectly adapted to that condition, and during times when enormously large volumes of gas are required the quality must still be well adapted for those altered conditions. If these specifications are not followed loss of flexibility will be occasioned. If an engine, running under a nearly closed throttle, at low speed, draws—as it is likely to do—too weak a mixture to be perfectly explosive when mixed with the exhaust gas left in the clearance spaces of the cylinders, explosions will probably be missed and the engine will fail to run regularly at very low throttle openings. Under this condition it should be remembered that the compression is low, and mixtures which might explode infallibly at high throttle openings may prove uncertain. If the quality of the mixture at full throttle is too rich, it will be slow burning, and the engine will not speed up under load, owing to the low initial pressures developed and the large losses to cylinder walls and through the exhaust. A mixture which would be too weak at low throttle to ignite readily under the low compression and large exhaust admixture then prevailing will ignite with certainty when used in full charges. A high degree of flexibility may be secured by employing a mixture of slightly abnormal richness at small rates of gas demand and a more normal mixture at large degrees of consumption.

The enhanced flexibility of modern petrol motors is largely due to improvements in carburettors. It is closely dependent, too, upon the manner in which gas is admitted to the cylinders by the valves. Unless the latter are so liberally designed that the engine may draw an amount of gas unlimited, so far as the valves and ports are concerned, it cannot run at so high a speed as it would otherwise attain. Flexibility is thus sacrificed. On the other hand, unless the valves are so operated that they open infallibly and uniformly during periods of minimum gas demand, the engine cannot run regularly at low speeds, and flexibility is again sacrificed at the other end of the scale. The adoption of the mechanically-operated inlet valve has done much towards securing uniform engine operation at low throttle openings. The use of large valve and port areas, with the most intimate connection with the combustion space, has led to high maximum engine speeds and thus to flexibility. A late closing of the inlet valve has been found to secure the entrance to the cylinder of full charges at high speeds, and this means that higher engine speeds may be maintained under load than would otherwise be

possible. Then, too, an early opening of the exhaust valve allows the cylinder to clear itself more fully of the burnt gases, largely prevents back pressure and permits of higher sustained speeds under load. These two practices in valve timing tend toward a high degree of flexibility.

The moment of inertia of the flywheel, a function of its mass and mean diameter, has an important bearing upon the minimum rate at which a motor can run under load, and hence upon the property of flexibility. If too small or light a flywheel is used, a point will be reached in the slowing down of the motor when the energy stored in the wheel will be insufficient to carry the engine past compression, and the motor will stop. This point will be reached the sooner in proportion as the rate of compression employed is high—the capacity of the flywheel remaining the same. With a motor of a given number of cylinders and compression pressure, the larger the capacity of the flywheel the slower it can run under load without signs of distress. On the other hand, the use of a very large flywheel prevents the realisation of a high degree of flexibility as defined from the standpoint of prompt acceleration, which may now be considered.

The rapid changes of speed, under load, which constitute the property of prompt acceleration or "picking up," depend pri-

The Mercedes Car at Monte Carlo on the completion of its recent run in record time from London.

marily, remarks Mr. Albert L. Clough in the "Horseless Age," upon the manner in which energy is furnished by the motor during its cycle, or, in other words, the distribution of its power production. The sudden opening of the throttle of a motor, and the rapid addition of energy derived from the explosion of a large accession of mixture, are absorbed in two ways. It goes either to the acceleration of the car or to the acceleration of the flywheel. With a given addition of energy to the system, per unit of time, the larger the demand made by the flywheel the less energy will go into car movement, and the less will be the rate of the vehicle's acceleration. The proportion of the total energy absorbed in flywheel acceleration will mainly depend upon the number of cylinders of the motor, a certain horse-power being assumed, and upon the rate of revolution of the engine in respect to the car speed.

(To be concluded.)

THE question is often asked as to whether it is possible for a lady to drive a car. In this connection we may mention that Miss Lane, of Leicester, has written to Messrs. Humber, Ltd., stating that she recently drove a 15-h.p. Coventry Humber car from Leicester to London, via Kettering and Bedford, without having once to change gear. "Seeing that this necessitated climbing Clack Hill, out of Market Harborough, it shows that a lady need not be afraid of the 15-h.p. car on account of the gear-changing, as my experience has been that this car will take any ordinary hill on the main roads without any change whatever."

SIGNS FOR BRITISH ROADS.

FIG. 1.

AN important part of the policy of the Motor Union has consisted in efforts to secure considerate driving on the part of its members, and also by motorists generally. This is particularly desirable in the neighbourhood of schools, churches, sharp corners and the like, where want of knowledge of the whereabouts of such buildings and turnings has led to many mishaps. In order to give a practical turn to its plans, the Motor Union has now prepared a series of signs to be erected in suitable positions, and they hope that public authorities, hospital managers, landowners, the clergy, schoolmasters and private residents may put up such cautionary signs for the public safety as well as the convenience of those who motor. The idea is a feasible one, and we are glad to know that the suggestion has already been well received in many quarters. The Uxbridge Urban District Council is a case in point. In view of the increase of motor-car traffic through the town, Dr. Look recently offered to provide the district with a notice board requesting motorists to drive slowly through Uxbridge. On consultation with the police authorities it was conceded that the notice should be erected close to St. Andrew's Church, and this is being done. What has occurred in this Middlesex town may well be done elsewhere if motorists will take the initiative.

In Fig. 1 we give a reproduction of the sign that is provided for erection at cross and converging roads, carriage drives, footpaths, &c., the entrances of which are concealed. Others

FIG. 2.

FIG. 3.

provided are shown in Figs. 2 and 3. In every case the name of the town or village is specially cast. For the word "school," "level crossing," &c., may be substituted. The maximum width of the signs is two feet, and, doubtless, these warning indications will become familiar objects of the roadside.

WE spent a few minutes the other day in looking over the extensive stock of second-hand cars at present available at the depot in Euston Road, N.W., of Messrs. W. A. McCurd, Ltd. They range from an 8-h.p. single-cylinder Rover to a 24-36-h.p. De Dietrich, and comprise examples of all the leading models, many of them being provided with covered bodies. Mr. McCurd, the managing director, makes a point of keeping the vehicles ready for a trial trip, so that, now there is a promise of more settled weather, any intending purchaser can have his requirements promptly filled. Mr. McCurd's latest departure is the establishment of works at Willow Walk, Kentish Town, N.W., for the manufacture of Cape car hoods and glass wind screens. This branch of the business is to be carried on as the Cape Car Hood Company, and we understand that not only is it the intention to supply high grade goods at moderate prices, but, what is equally important, to fit them to cars with as little delay as possible, Mr. McCurd knowing from experience that many motorists have been deterred from having these useful adjuncts applied to their vehicles owing to the time usually occupied.

IN AND ABOUT LINCOLN.

IT is very evident that the Motor Union Meet at Lincoln to-day (Saturday) will be a very enjoyable function, thanks to the enterprise of the Lincolnshire Automobile Club.

Lincoln is admittedly an interesting place, but we think those who take the run arranged for after the meet, &c., will be surprised to find how very beautiful the county really is. The tour is a circular one, through Tennyson's country and the Lincolnshire Wolds, and much really delightful scenery will be passed through, as well as some historical places.

A run of twenty-one miles along a good road takes us to Horncastle, a town of much historical interest, and then in a mile or two Tennyson's country is reached. Somersby is the centre, and a halt should be called to look over the quaint church, Tennyson's birthplace, the "Moated Grange," and Holywell Glen, the last mentioned a place one can spend an hour or more in.

Up to Harrington Hill there are many charming scenes, notably Bag Enderby and Harrington Hall, and when the hill has been surmounted (it is very steep) a magnificent river unfolds itself. A lovely run along charming lanes takes us through South Ormsby, &c., and *via* Skindleby and Partney to Spilsby, where another halt should be called. Here Sir John Franklin was born, and a fine statue has been erected to him. The "butter cross" in the market-place is worth noticing, and the splendid monuments to the Willoughby family (ancestors of Lord Willoughby de Eresby, M.P.) should be inspected. The "Avenue" and the "Shades" will of course be visited. The latter is a place of very wide fame.

On leaving Spilsby another pretty road takes us through the two Keals, E. and W., and from Keal Hill is another magnificent view over the Fen country and to the Norfolk coast. A succession of pretty views, charmingly diversified, are passed as we make for Revesby, the home of the Stanhopes, and where is a picturesque and famous inn. Then through wooded lanes and a water splash we make for Scrivelsby, the picturesque home of the King's Champion, and along more lovely roads to stately Tattershall Castle, over 400 years old, but not looking so ancient, and then on to Woodhall Spa, where the motorists are left to stay or make their way home.

Apart from the scenery around, the ancient city of Lincoln has much of real interest, as is revealed in the New Guide by Dr. E. Mansel Sympson, J.P., the Sheriff, which has just been published by Messrs. Methuen and Co. Of great historical renown since the very earliest days, the city has a picturesque situation. In the earlier years of the last century it was known as the place of orchards, although the rapid growth of the manufacturing industries of the city has besmirched the scenes pictured by De Wint and Turner. The town is still full of archaeological and æsthetic delights to the visitor. The castle is beautiful beyond the charm of most castles; the Minster is a crowning glory, the best view of which, according to Dr. Sympson, is that from the south side of the Witham, near Washingborough. Even Ruskin acknowledged the greatness of Lincoln Minster, for in "Modern Painters" he declared that "the only art work which France and England have done nobly is that which is centralised by the Cathedral Church of Lincoln and the Sainte Chapelle." Beyond these two great buildings there is much of interest in the Stonebow, the ancient gate of Agricola, the Palace of John of Gaunt, and other historical possessions fully described in this guide, which will provide a pleasant souvenir to those who to-day will be seeing Lincoln for the first time, their appetite whetted to know more of a city which has played a notable part in the history of the country.

EXTENSIVE works, covering an area of over 10,000 square feet, have been opened at 108-110, High Street, Camden Town, by Mr. F. H. Melhuish for motor-body building and repairs.

IRIS CARS, LTD., have sent us a photograph of a 25-h.p. Iris landaulet for town use recently taken out to Sydney by Mr. H. R. Dixon, director of the Dixon Tobacco Company, Ltd., one of the largest concerns of the kind in Australia.

CONTINENTAL NOTES.

A Noteworthy Run from Paris to Madrid.

M. Sorel has just accomplished an excellent run on a standard 60-h.p. 1907 model De Dietrich car, fitted with double phaeton body, from Paris to Madrid, in the splendid time of 28 hours 14 minutes, thus establishing a new record. M. Sorel left Paris on the 6th inst. at 2 o'clock in the afternoon, and reached Madrid at 6.14 p.m. the next day. It was pouring with rain practically the whole of the distance, the roads being consequently extremely bad. It is interesting to compare M. Sorel's time with that of the quickest trains running from Paris to Madrid. The express, which starts at 10.23 p.m., takes 32 hrs. 39 min.; the Rapide, starting at 7.40 p.m., accomplishes the journey in 27 hrs. 43 min.; while the fastest train, the South Express, takes 26 hrs. 5 min., so that the performance of the De Dietrich speaks much for the reliability of the vehicle.

Darracq retires from the 1907 Races.

Some surprise has been caused in French motoring circles by the announcement that the Darracq Company will not compete in any of this season's races, although they had entered vehicles for all the important events, including the A.C.F.

A Two-Cycle Engine Competition.

The Technical Committee of the French Automobile Club has just issued the rules of the competition of two-cycle engines suitable for motor vehicles, which is to be held in October, at the laboratory of the A.C.F. at Levallois. The trial will be open for motors of from 8-h.p. to 24-h.p., and will consist of (1) a six hours' test under load; (2) a three hours' run under half-load; and (3) a three hours' test running light, at the same speed as is recorded in the load trial. All classes of liquid fuel—petrol, alcohol, heavy oil, &c.—will be permitted. The points on which the judges will base their awards are: (1) the weight per horse-power of the engine, and (2) the cost of operation in francs per horse-power per hour. Competitors will be allowed one day for the erection of their engines on the test bench, and a second day for any preliminary running they deem necessary; on the third day the six hours' test under load will be made, and on the fourth day the two three-hour runs. Entries at £4 per motor will be received until July 31st, and must be accompanied by drawings and description (in French) of the various engines.

Miscellaneous Items.

The French Chambre Syndicale de l'Automobile has voted a sum of £200 as a prize in a competition, which is to be organised

A Turn in the Corniche Road.

A Tunnel near Monte Carlo.

The French Custom House near the Italian Frontier.

TOURING IN THE SOUTH OF FRANCE.

[Motor, New York.]

Grand Prix. The situation has arisen through the Italian Fiat Company having secured Wagner to drive one of their cars in this year's races, and it is by way of publicly protesting against what M. Darracq conceives to be a disloyal and unsportsmanlike act on the part of a foreign rival that he has taken the decision alluded to above.

French Motor-Car Imports and Exports.

At the meeting of the Chambre Syndicale de l'Automobile last week it was announced that the imports of foreign motor-cars and parts into France during the first three months of the current year had attained a value of only £65,240, a decrease of £2,920 as compared with the corresponding quarter of last year. On the other hand, the exports of French motor-cars and parts during the same period have increased from £1,345,080 to £1,527,480.

The Austrian Light Car Trials.

Forty-nine entries have so far been received for the Reliability Trials which are to be held in Austria on the 24th, 25th and 26th inst., under the auspices of the Austrian Automobile Club. The event will comprise a run from Vienna to Klagenfurt and back, two hill climbs and a speed trial over a measured level distance being included in the programme,

by the A.C.F., for the best liquid fuel to take the place of petrol.—A 60-h.p. De Dietrich car has been entered for the Moscow-St. Petersburg race, which will take place on the 7th prox.—During the time the cars are competing in the Herkomer Touring Trophy Competition in Saxony a vehicle of the Kaiserliche Club will lead the way, and no competing car will be allowed to pass it.—King Alphonso has just placed an order for a 22-h.p. Berliet car.—Owing to the large number of motor events which have been organised for the 1907 season, the Turin Automobile Club has decided to postpone the reliability trial it proposed to hold next month.—An automobile club is being formed at Trieste, Austria.—A meeting of delegates of the various national automobile clubs is to be held in Homburg on the 15th prox., on the occasion of the Kaiser's prize race.—It is reported that negotiations are in hand for the establishment of a branch factory at Cracow for the manufacture of Germain cars in Austria.—The Kaiser is reported to have placed an order for a 50-h.p. Adler car, which will be fitted with a six-seated body.—An international motor-car exhibition is to be held in Copenhagen from the 28th September to the 7th October next.—After the 18th inst., no practising will be allowed on the A.C.F. Grand Prix course until further notice.

THE G. & R. CARBURETTOR.

WE illustrate herewith a new carburettor which has recently been devised by Messrs. A. Gunston and A. Richardson, and which is stated to be giving excellent results in practice. The object of the inventors has been to devise a carburettor which shall give a constant mixture at all engine speeds and loads, and at the same time shall not possess any delicate springs or moving mechanism, special attention

Fig. 1.—Sectional View through Float and Spraying Chambers.

having been devoted to obtaining a variable flow of petrol through the jet without the usual complications, and, further, to cause the variation to act automatically. Referring to the illustrations, Fig. 1 gives a section view through the float and mixing chambers, and Fig. 2 a transverse section through the latter. As will be seen, the device consists essentially of a constant level float chamber F C supplying petrol to a peculiarly formed spray jet S J. Two air inlets are provided, the main one M A causing the air to flow across the petrol jet, and an auxiliary air intake A A, which is set at right angles to the other. The auxiliary air inlet is controlled by the horizontal movement of the piston throttle P T, and, owing to its position, any air which is admitted through it meets the gas formed by the main air rushing past the jet at right angles, causing an intimate mixture to take place. The air inlet M A is formed with a circular groove in which are drilled three holes at varying heights above the level L of the spirit in the float chamber. The effect of the suction of the motor is to cause the petrol to rise into the circular groove above referred to, and to issue through one

Fig. 2.—Transverse Section through Mixing Chamber.

or more of the orifices, the quantity issuing depending on the suction of the engine. An exhaust jacket E J is provided to maintain the mixing chamber at an even temperature. When

once correctly adjusted the carburettor requires no further attention, all the variations in petrol and air supply being performed automatically, the only control lever being that connected with the piston throttle. We may add that the carburettor is being put on the market by the Central Garage and Motor Company, of Sawclose, Bath.

SOME USEFUL NOTES.

A GOOD guide to tyre inflation when no pressure gauge is fitted to the pump is to take two of the spokes of the wheel, one in each hand, and stoutly shake the car, noticing whether the wheel moves to and from the operator while the part of the tyre on the ground remains stationary. If any side roll is apparent the tyre is not sufficiently inflated.

ONE cause of unnecessary wear in chains is failure to keep the sprockets in proper alignment. In cars fitted with side chains this condition may arise through the shifting of the axle sidewise under the springs, or the unequal length of the distance rods. Care should be taken in adjusting the chains to see that these rods are taken up or let out equally, so that each pair of chain rings revolves in the same plane.

IT occasionally happens that the user of an acetylene lamp fails to get a good light owing to the fact that the generator does not have a sufficient supply of water. Every time the generator is supplied with carbide see that it has plenty of water; one is as essential as the other. The gas tips should be kept open and clear for the passage of gas, and a small hair wire should be used to clear the holes, which sometimes get carbonised. If one hole stops up, the pressure, being unequal, may cause a jet of gas to strike the lens mirror and crack it. Care should also be taken to see that all connections leading from the generator to the lamp or lamps are tight. Sometimes condensation causes water to accumulate in gas cocks and tubing, which should be cleaned out.

THE efficiency and economy of a petrol motor depends in a large measure on perfect compression. Special attention should, therefore, be paid to this point, as any leakage in piston rings, valves, plugs, packings or porous cylinder walls directly affects the working of the engine.

NOTHING is too small or unimportant to be considered in the running of a motor-car. For instance, the petrol tank, though it is simply a metal receptacle, quite frequently does its share towards making trouble, especially the tank with the gravity style of feed. On more than one occasion a weak engine has been made strong by simply opening up the vent hole in the tank-filling plug or drilling one where none was provided, as with no vent the petrol level is held up by the formation of a partial vacuum above it, and will not flow to the carburettor freely enough to make the requisite amount of mixture. Another point in the gravity system is the liability to an interruption in the flow on a steep hill when the petrol becomes low in the tank, on account of the lack of fall from the tank to the carburettor. This can be got over by arranging a small supplementary tank under the bonnet near the carburettor, while we have heard of one motorist who surmounted the difficulty by backing his car up the hill, thus putting the tank at a higher level than the carburettor and giving the petrol the needed fall.

To determine whether a chain is seriously worn it should be stretched out tight on a smooth floor, and then its ends should be pushed toward one another, without buckling it out of a straight line. The difference in its length when tightly stretched out and when its ends are forcibly pushed together is the sum total of the wear of the rivets. If this amounts to two inches or more in a chain of usual length, it should be replaced. It is a bad practice, however, to put a new chain on badly worn sprockets, so that the condition of the latter should at the same time be inspected.

The Speedwell 25-h.p. Car.

SOME brief particulars of the new British-built cars of the New Speedwell Motor Company, Ltd., were given in our report of the Olympia Show, but the more complete description we are now able to publish will no doubt be read with interest, as, while the design generally follows the usual arrangement of live axle vehicles, the details show many departures from the ordinary practice. Three sizes are being built, viz., 10-12-h.p. two-cylinder, 25-h.p. four-cylinder, and 40-h.p. six-cylinder. The following particulars relate to the 25-h.p. car, but, except where specially mentioned, they may be taken as applying to all the different models. The engines (Fig. 4) have the cylinders cast in pairs, with the inter-

(Fig. 3) runs in two rows of adjustable ball bearings with the driven pulley supported centrally between the fork that carries the bearings, and the bracket is bolted on to the front of the first cylinder in such a manner as to distribute the strain from the driving belt equally. The belt is automatically retained at the correct driving tension by means of a volute spring beneath the fan carrying fork, a long pin passing up through the spring, so that the latter cannot sway sideways, but can only move in a vertical direction. The carburettor is of the automatic float feed type, located on the right hand side of the motor. The hot air for the mixture is taken from a pocket around the exhaust, and combined with the cold air in proper proportions. The device is automatic in action,

Fig. 1 and 2.—Elevation and Plan of Chassis of Speedwell-25-h.p. Car.

changeable valves all operated off a single cam shaft. The dimensions of the cylinders are: 10-12-h.p. 99 mm. by 130 and 25-h.p. and 40-h.p. (six-cylinder) 100 mm. bore by 130 mm. stroke. The base chamber can be dismantled without interfering with the crank shaft or clutch, allowing a ready inspection of all the internal parts. Except on the 10-12-h.p. car dual high tension ignition is provided—magneto and accumulators. The speed of the engine is controlled by two small vertical levers projecting from the centre of the steering wheel but not turning therewith. The magneto and water circulating pump are driven off a cross shaft by a worm-gear on the cam-shaft, and the radiator is of the honeycomb type. The water is pumped from the bottom of the radiator to the cylinders, upward to the top and out through a pipe which is in connection with the upper end of all cylinders, and thence through a flexible rubber connection to the top of the radiator, where it is cooled. The fan spindle

additional air being supplied at high engine speeds by an automatic air valve, which is controlled by the speed of the motor. The petrol is fed by gravity to the carburettor from a tank placed under the front seat. The silencer is also of a new type; it consists of a long narrow cylinder, three openings being provided at the engine end of same, through which air is drawn in with the exhaust. The action is stated to correspond to that of the carburettor spray, the cold air being drawn into and through the central tube by the inertia of the exhaust gases issuing from the expansion chambers of the silencer, and as it mingles with these latter before they emerge, the heat and consequently the pressure is so reduced that there is no noise, while the efficiency of the engine is augmented. The lubrication of the motor is effected by the pressure of the exhaust, leads conveying the oil to every principal bearing; the base chamber is also provided with partitions, so that the splash remains constant.

Coming now to the transmission, the clutch, which in the two large cars is of the multiple disc type running in oil, is, as will be seen from Fig. 5, contained in the gear-box, and attached direct to the main driving shaft, increasing its strength and securing alignment between clutch and gear. The plates of the clutch are self-separating, they immediately ceasing to grip as soon as the pressure of the spring is released, enabling a change

Fig. 3.—Section through Fan and Pulley Spindle, and Support.

of speed to take place quickly and without noise. The separation of the plates is effected automatically by means of spring tongues formed on each alternate plate. The gear-box is adapted to give three speeds forward and a reverse, with direct drive on top speed, the control being by a small lever working in a special form of "gate" quadrant. The gearing is locked in either position, the whole of the locking mechanism being contained within the gear-box. The final transmission is through a cardan shaft and bevel gear to a live axle, which latter forms another of the special features of the Speedwell vehicles. The axle (Fig. 6), which is built up of two members, is claimed to combine all the advantages of the chainless drive with

Fig. 4.—General View of Valve Side of Speedwell 25-h.p. Engine.

the safety and strength of the solid forged steel axle. It is so arranged that the weight of the car is entirely borne by the lower axle, which is made of forged steel, and runs across from one to the other without any break or joint. The wheels run on the ends of this axle, and no weight is thrown on the driving mechanism. The differential is supported on this solid axle, through the bosses of which pass the live shafts which transmit

the power to the road wheels by means of dog clutches. The whole of the driving gear can be dismantled without interfering with the wheels or jacking up the car; the differential case is made in two halves, parting horizontally, making the inspection of the crown bevel driving pinion and differential gear an easy matter; further, the gearing can be lifted out by simply drawing

Fig. 5.—View of Clutch and Change-speed Gear-box.

out the two driving shafts on either side after removing the wheel hub caps. The inner ends of the shafts are square in section, and fit in corresponding square holes in the side bevel wheels of the differential. It may here be mentioned that ball bearings are employed throughout except on the engine.

The rear dumb irons are replaced by halves of semi-elliptic springs, and a special feature is the double pivoted spring shackles, which are claimed to allow the springs greater action without strain than when secured in the ordinary way. The bottom leaf of the portion which displaces the dumb iron is set outwards at right angles and curled round to form a bearing for one of the bolts of the shackles. Provision has been made for oiling all the joints of the springs and shackles, by the insertion of concealed and dust-tight oilers which do not project beyond the ordinary level. The arrangement of the brakes is interesting, the usual system being reversed—that is to say, the pedal is connected up to the internal expanding metal-to-metal brakes working inside drums connected with the hubs of the rear road wheels, a special compensating device to equalise the action of the two brakes being provided. The emergency brake, which is controlled by a hand-lever at the side, works on a drum at the rear of the gear-box.

Fig. 6.—The Speedwell Rear Axle.

The frame is of pressed steel, narrowed at the dashboard to give a wide steering lock. It has four cross ties, all gusset plated, the front one serving as a cradle to carry the radiator. It will be seen, too, from Fig. 1 that the power transmission mechanism is all in one line, the crank and cardan shaft being in the same plane throughout. The wheel base of the vehicle is 9 ft. 6 in., and the track 4 ft. 6 in., which enables a roomy side-entrance body of the open or closed type to be fitted. Altogether the new Speedwell cars reflect great credit on their designer and should take a prominent position in the growing list of British-built vehicles.

To meet the convenience of motorists at Whitauntide the Dunlop Tyre Company will keep all their depots open during the holidays.

WELL equipped with repair plant, the new Star garage of Messrs. Broadway and Co. should be of service to motorists passing through Alnwick.

We learn that the Royal Automobile Club has just awarded the "Dewar" Challenge Trophy for the most meritorious per-

formance in a long distance trial taking place between January 1st and December 31st, 1906, to Messrs. Dennis Bros., Ltd., of Guildford, for their record run, on one of their cars, of 4,007 miles without an involuntary stop. We give an illustration of the vehicle herewith, and may add that it could have undoubtedly doubled the distance, as the run was unfinished; the same car has since been supplied to Mr. Hylton Lamotte, Shirley, Croydon, who has himself driven it 20,000 miles without a single mechanical stop. According to the certificate given by the R.A.C. in respect of the car, "the roads were heavy and wet during the greater part of the trial, and on two occasions part of the run was taken through snow. At the official examination on completion of the run the entire mechanism was found in remarkably good condition. The road wheels, gear-box, and live axle are fitted with ball bearings throughout, and all those examined were in perfect condition. The engine was in perfect condition, including piston rings, all bearings and valves." This is not the first time that the reliability of the Dennis machines has been demonstrated, as in the 1,000 miles reliability trial of 1903 one of their cars attained fourth highest marks out of 140 competitors, and was second among the English-built vehicles—in fact, it obtained 2,991 marks out of a possible 3,000.

ONE of the new Renault motor-cars caught fire early on Saturday morning in Brixton Hill. The driver tried to put out the flames, and was badly burned while doing so. Four fire-engines had to be summoned before the fire could be extinguished, and the car was practically destroyed. The fire is reported to have been caused by an overflow of petrol.

THE Tramways Committee of the Leicester Corporation have leased to Mr. G. H. Wait, who is well known in connection with the Clyde motors, a large portion of the old tramway depot, to be used for a motor works and garage. This will accommodate about fifty cars, and Mr. Wait is being joined in the enterprise by Mr. C. B. Warner, of Quorn.

A NEW garage in Norfolk Street, Sheffield, has been built for the Hattersley and Davidson Automobile Company.

MESSRS. RICE BROS., of 63 West Street, Horsham, have a number of motor-cars for sale or hire, and also undertake all classes of repair work.

It is definitely fixed that the drivers of the Weigel cars in the A.C.F. Grand Prix race will be Messrs. D. M. Weigel and Pryce Harrison, with Mr. Robert Laxon as reserve.

THE value of the motor-cars and parts exported from the United States during March last amounted to £109,069, as compared with only £58,712 in the corresponding month of 1906. England headed the list with £29,324, Canada being second with £24,904.

APPLICATION is being made to the Local Government Board by the East Sussex County Council for a speed limit of ten miles an hour for motor-cars on that portion of the London-Brighton road in the village of Handcross, between the 33rd and 34th milestone.

MESSRS. C. A. VANDERVELL AND CO., of Warple Way, Acton Vale, W., the makers of the "C.A.V." accumulators, have sent us a sample of a new ignition switch they have lately introduced, and to which we hope to refer more fully in a subsequent issue.

THE discharge by a metropolitan magistrate of the driver of a motor-car in which Sir Wilfrid Laurier, the Canadian Premier, was passenger, for exceeding the speed limit in Regent's Park, was clearly, as Mr. Plowden expressed it, a case of preferential treatment.

THE Vicar of Midhurst, the Rev. Frank Tatchell, deserves the thanks of motorists for his offer to provide direction signs at the corner in Midhurst where West Street—leading to the Chichester road—and the Bepton, Petersfield, and Petworth roads join. Hitherto it has been very easy for drivers to go the wrong way on arriving at that spot.

THE first motor-car was introduced into the Canadian province of New Brunswick in 1903, and in the spring of 1905 a law regulating the speed of automobiles and prescribing registration was adopted. At that time there were only twelve cars in the province, but by the spring of 1906 the number had been doubled, and an automobile club was formed, through whose efforts more money was spent for the improvement of the public highways in one year than had been spent for many years prior to that time. Fully 75 per cent. of the cars now in use in New Brunswick are of American manufacture, despite the import duty of 35 per cent., the remainder being of French, English and Canadian construction.

The Speedwell 25-h.p. Limousine-Landaulet (See page 1251.)

A CORONER's jury on Tuesday returned a verdict of manslaughter against Miss Elsie Fox, whose motor-car collided with a covered van near Royston. The driver of the latter received injuries resulting in his death.

MOTOR-BOAT racing will be a feature of Oulton Regatta next week.

A GARAGE for cars has been provided at the Irish International Exhibition at Dublin.

SHEFFIELD is to have a motor fire engine, fitted with a 40-h.p. four-cylinder Argyll engine.

A 16-h.p. Albion car has lately been supplied to the War Office for use in the Curragh Camp, Ireland.

SHOULD the entries warrant, a class for motor-buses will be arranged in connection with the Southern M.C. climb on Captain Kydd's Hill on the 22nd prox.

A NUMBER of gentlemen connected with the Scottish motor trade have entertained Mr. Kenneth Henderson, manager of the Scottish Automobile Company, Ltd., to dinner.

THE Daimler Company inform us that in addition to several orders from private individuals, as a result of their showing at the Madrid Exhibition, they have booked an order for a 28-h.p. car from the Duke of Saragossa.

Details of Rear Spring Connections on Speedwell 25-h.p. Car. (See page 251.)

THE Mayor of Hastings has forwarded a copy of some notes on Hastings and St. Leonards, compiled by Mr. A. S. Wilson, Medical Officer of Health of the borough, and dealing with its climatology and sanitary condition. Its perusal should convince readers of the delights of the place for all in search of health.

THE Annuaire I.V.A. de l'Industrie Velocipedique et Automobile en France, which has just been issued, should prove useful to all interested in the cycle and motor trades in France. From the copy which has reached us from the publisher, M. F. Gebert, 31, Boulevard Magenta, Paris, we note that the directory is divided up into a number of sections, including those referring to motor-car and cycle manufacturers, agents, makers and dealers in automobile components, ignition apparatus, lamps, bodywork, motor-boats, tyres and wheels, especial care having been taken to verify the addresses. A useful feature of the Annuaire is the alphabetical list of trade names, which enables the name and address of the maker of any car, cycle, motor or automobile component to be quickly turned up.

THE cost of the Brooklands automobile track will be about £150,000.

THE Continental Tyre and Rubber Company have now a tourists' office at their Paris depot.

CONSIDERABLY over 100 entries have been received for the motor meet at Bexhill on Monday and Tuesday next.

IT is reported that the motor-bus is to be introduced into Palestine, a service between Jerusalem and Bethlehem being projected.

THE Scottish Accident, Life and General Insurance Company, Ltd., of 115, George Street, Edinburgh, is undertaking motor accident insurance.

THE death took place on Wednesday morning of Mr. Adney Payne, who received injuries in a motor-car accident a fortnight ago. The deceased gentleman was the father-in-law of Mr. Walter Gibbon.

THE Belhaven Engineering and Motors, Ltd., is the title of a company formed to take over the business carried on by Messrs. R. Morton and Sons, Ltd., at Wishaw. Industrial vehicles will have a prominent place among the company's productions.

FROM the Franklin Manufacturing Company, Syracuse, N.Y., U.S.A., comes a very artistic catalogue describing the latest models of Franklin cars, the great feature of which is the employment of air-cooled engines, which are made in sizes ranging from 12-h.p. four-cylinder to 30-h.p. six-cylinder.

THE Automobile Club of New South Wales have decided to support the proposal of the Dunlop Rubber Company to institute an inter-state motor contest, to be held in November next, the course being Brisbane to Adelaide, a distance of 1,850 miles, during which some of the worst Australian bush roads and tracks will be encountered.

RECENT purchasers of 30-h.p. Hotchkiss cars include Lady Newborough, the Right Hon. Sir Frederick Milner, Lt.-Col. Cotton Jodrell, C.B., and Mr. H. St. George. The London and Parisian Motor Company, Ltd., have also received orders from Captain C. P. B. Wood, D.S.O., and Mr. R. E. Myddelton for 45-h.p. six-cylinder Hotchkiss cars.

THE industrial prosperity of Coventry is leading to enormous building developments, as shown by the fact that at recent meetings of the General Works Committee of the City Council plans were approved for close upon two hundred houses, mostly for the working classes. Another effect of the rapid development of the town is seen in the demands that are being made upon the school accommodation, which is at present being severely taxed.

THE second week of the long-distance reliability trial for a six-cylinder Hotchkiss car has seen some very interesting roads traversed under weather conditions that have varied from fine and warm to cold and wet, with some thunder. On Monday, the 6th inst., the car journeyed to Leeds from Leicester by a devious route, embracing Ashby-de-la-Zouch, Derby, Worksop, and Doncaster. On Tuesday York, Scarborough, and Hull were visited, and back to Leeds by Beverley. On Wednesday the party had its first taste of Midland manufacturing districts in a run through Huddersfield, Sheffield, and Chesterfield, and thence on country roads via Goole and York to Leeds. On Thursday Newcastle was reached, Friday's run being through Hartlepool and Stockton to Boroughbridge and back via Leeming Lane to Darlington and on to Newcastle; while on Saturday last the car ran to Carlisle and Penrith and back via Alston and Durham. The vehicle has been running perfectly, and, barring one nail puncture, the tyres have given no trouble, and up to date are in wonderful condition after their 1,700 miles of road travel. This week Monday and Tuesday night were spent in Sheffield, Wednesday in Cambridge, Thursday in London; while to-day (Friday) a start will be made for Dublin via Hereford and Holyhead.

CORRESPONDENCE

[Letters to the Editor should be addressed to the office,
87-89, Charing Cross Road, W.C.]

THE KAISER'S PRIZE RACE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—You will no doubt remember that the Kaiser's Prize race has been phenomenally successful in gaining a great number of entries. Unfortunately, at the last moment, this success seems as if it was going to completely spoil the race, as the German Club have seriously suggested that the race shall be run in the form of two eliminating trials, and that then the first twenty cars in each eliminating trial shall run in the Kaiser Prize. It seems to me that a perfectly easy way out of the difficulty would have been to have limited the entries to one car from one maker. I am glad to see the Royal Automobile Club are protesting against this alteration of the rules; but people often seem to wonder why British manufacturers do not more frequently enter cars in foreign competitions, and this is one of the reasons—that you never can be sure up to the last moment whether the rules will not be altered from those under which you enter. I hope that great prominence will be given to this very serious alteration, which certainly would have prevented many people from entering.—Yours truly,

S. F. EDGE.

TOURING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the letter by "A Touring Motorist" on the subject of driving certificates, I certainly do not see that the dignity of the R.A.C. is at all impaired by their notifying members of the advantages that they claim for their driving certificates. As to the actual usefulness of these certificates, that is another matter; it is quite true that by their aid it is possible to obtain a French driving certificate without examination, which otherwise, allow me to inform your correspondent, in reply to the query contained in the termination of his letter, is impossible. With regard to the practical usefulness of the R.A.C. driving certificate, apart from the matter of obtaining the French "Permis de Conduire," I cannot see much good in it; one cannot imagine a bench of magistrates reducing one's fine, or even taking in evidence for the defence, the fact the summoned motorist had a driving certificate as a defence, or even an extenuating circumstance. My remark as to the doubtful utility of the certificate in England applies only to the owner's certificate. There is no doubt that the paid driver's certificates are an exceedingly useful institution.—Yours truly,

ALAN A. L. HICKMAN.

A SIMPLE HUB BAND BRAKE AND HOW TO MAKE AND FIT IT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—So many cars are fitted with band brakes and so many are inefficient that perhaps this short letter may be of use to amateur motorists. The majority of band brakes are actuated by a lever fitted on the driving side of the car, and working on a quadrant fitted with teeth that engage with a projection on the lever, which can thus be held fixed. The bands work on a drum fixed to the rear wheels, and are usually lined with cast iron or wrought iron segments or with leather. Gandy belting or some patent lining, the bands themselves being as a rule made either of spring, or strips of blue lagging steel. The first is, as a rule, rather hard and apt to fracture, and the latter has a tendency to stretch. The drums are either of malleable cast iron or of phosphor bronze. The usual iniquitous practice is to have a malleable cast iron drum with band liners of either steel or wrought iron, with the result that in a very short time the drums become mere skeletons and what little survives tumbles off, and if there is nothing for the band to grip, the consequence on a hill may be the reverse of agreeable. My personal recollection includes a run beyond the legal pace down Hog Trough Hill and a broken collar bone. Another criminal feature in the usual apology for a brake is that a steel cable is employed to connect the bands with the lever, the idea being that the cable permits of compensation so that the two bands go on at the same time. Stiffness prevents this, but what happens is fraying of the cable and giving way, with resulting uselessness of the brake. The idea, like a good many others, is excellent on paper, the cable passing through a hollow metal tube to the end of which is fixed the actuating lever, and the cord passes over projections at either end to a triangular rocking piece to which the bands are fixed. As the lever is pushed forward the ends over which the cord passes are depressed and thus the cable is tightened and the brakes put on; in actual working the cord does not work over the projections, so the brakes are not thus equalised, but, as already stated, the cable rubs there and finally breaks.

Perhaps the easiest thing will be now to shortly state how I fitted the new brakes on my own car, and, as they have been in constant use for nearly two years and still hold, I do not think I need say more in their

favour. The drums were but skeletons, still they answered as patterns, and Messrs. Ginman managed, by faking them up, to cast from them two in phosphor bronze; of course a groove had to be turned up and the fixing holes drilled, otherwise they were fixed as they came from the foundry. The bands were made of 1 in. by $\frac{1}{4}$ in. hoop steel, the ends being turned over and riveted so as to make eyes for the bolts that held the band to the rocking piece. They were lined with Frood's lining 1 in. by $\frac{1}{2}$ in., the latter being fixed by countersunk rivets. The rocking pieces, which were forged from a bit of $1\frac{1}{2}$ in. square mild steel, were V-shaped, with a piece standing up for attachment to the actuating lever by forged rods with U-shaped ends in which the upright portion was held by a $\frac{3}{8}$ in. bolt. The brackets were forged out of $2\frac{1}{2}$ in. by $1\frac{1}{2}$ in. mild steel, and the accompanying sketch shows their shape—a flat base held in

position by the central bolt of the carriage spring, the U bolts also fixing the sides to the axle. From the upright arm there is a overhanging portion with a clearance hole ($\frac{1}{4}$ in.) so made that when the bands are hung from a bolt passed through this clearance hole they are exactly central with the groove on the drum. The connecting rods are also shown in the drawings. They are attached to the transverse metal tube by an eye bolt, with a nut on either side of the projection, on that tube, and thus any slack can be taken up, and in addition the brake is positive, the rods pushing it off when the actuating lever is pushed back. In my case I employed three-eighth rods drawn out of the solid and half-inch eye bolts. The ends of the transverse metal tube must of course be cranked out so that they are also exactly in line with the drum, and the bands must likewise be hung so that they are also exactly true with the groove—that is, the centre of the band must be over the centre of the drum. The advantage of this band brake is that all distance rods are dispensed with, so that when the brake is on it is on, and when off it is off, and cannot foul the drum. Eight forgings are required, excluding the suspension and other bolts. There are two brackets, two rocking levers, two connecting rods with U's at each end, and two eye bolts. A long half-inch bolt answers for the suspension, and four pins (hardened) are needed to hold the bands to the rocker, and a $\frac{3}{8}$ or $\frac{1}{2}$ in. bolt for connecting the connecting rod to the eye bolts which are fixed by a nut on either side to the ends of the rod worked by the brake lever.

Any blacksmith will make the forgings, the material for which can be obtained from most ironmongers; if not, from Messrs. Buck and Hickman, of Whitechapel Road, E.C. In order that the bands shall always hang central and not foul the rims on the drums, the suspension bolt must be a perfect fit in the clearance hole of the overhanging part of the bracket, and as there is considerable wear it should be case-hardened or made from "tool" steel. For the same reason the pins holding the bands to the rocker must be also case-hardened or made of tool steel. Malleable cast brackets would do as well, but for these a pattern is essential, and in order to stand the strain they must be stouter and cast with a central web as an extra support for the upright part. Personally, I prefer forgings, and, in addition to being stronger, they are cheaper. Should any reader decide to make one of these brakes and desire any

further information I, with your permission, shall be most happy to reply to any enquiries in the correspondence column of the *M.C.J.*—Yours truly,

CHARLES T. W. HIRSCH.

THE SOUTHERN MOTOR CLUB'S COMPETITION.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the letter from Mr. Malcolm Brooke, which you published on page 234 of the *M.C.J.*, I think it only right to that gentleman to entirely substantiate every statement he makes. I do not know exactly at the moment how our report to you came to be worded as it was, but I am looking into it. As regards Mr. Brooke's 18-h.p. six-cylinder Malcolm car, on looking at the report of the observer, I find that this ran perfectly for the first two rounds and for the best part of the third round, and then, owing to the ignition wire dropping on the cylinder, the insulation became burnt through and a short circuit was set up, causing a delay of some thirty minutes. Altogether independent of this result, I have since had a run on Mr. Brooke's car, and must say that my impressions are distinctly favourable.—Yours truly,

S. W. PHILLPOTT,

Hon. Sports Secretary, S.M.C.

The magneto has no tremblers, so possibly its behaviour is more consistent, still it is purely a question of timing and adjustment. All talk about the different results owing to the different character and chemical properties of the spark magneto, as against accumulator and coil, is the purest moonshine. So long as the spark is not less than a certain minimum temperature, and occurs at exactly the same point in all four cylinders every time, the power will be the same. We were allowed by the Daimler Company to experiment on one of their engines, and we made a winding and trembler to suit their distributor. That our theory is correct was proved; there was no difference in power between the magneto and accumulator and coil; the coil and accumulator used were of our manufacture.—Yours truly,

C. A. VANDERVELL AND CO.

THE COST OF CARS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am afraid I cannot understand the point of view of your correspondent "W. L. C.," who compares the price of a railway engine and a motor-car. As the price given for a chassis is that of a few racing cars only, and is, therefore, considerably inflated, it is probable that the £4,500 given as the price of a locomotive is correspondingly low.

Motorists leaving Laffan's Plain, Aldershot, on the news that the Review which was to have been held last week had been cancelled owing to bad weather.

ACCUMULATOR V. MAGNETO IGNITION.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—We have followed with interest the correspondence relating to accumulator and coil versus magneto ignition, more especially as we have ourselves gone rather thoroughly into the matter from a scientific point of view, in order to try and find out the real reason for the widely different results people seem to obtain from the same apparatus. We realised very early that when a practical motorist says he obtains more power from one or the other it cannot always be imagination; and the experiments we have carried out prove conclusively that a coil which gives good results on one engine will certainly not do so on another. In one experiment carried out by the writer, with two coils having different windings, the same engine gave 33-h.p. with one and 38-h.p. with the other. Both coils gave, apparently, the same spark on the bench. It was not a question of trembler speed, as the first coil worked better and gave more power on a six-cylinder engine. The determining factors appear to be the length of contact on the low tension side of the distributor, speed of engine, and construction of trembler. Nearly every type of engine seems to have one particular trembler, or trembler adjustment, that it suits best, and it is just as reasonable to expect an engine to give its best power on any coil as it would be to fit a carburettor of any make or size at random and expect perfect running right away.

In any case, is it not obvious that it is the very fact that the chassis of a motor-car weighs only about a ton that makes the price high? And does your correspondent really suggest that a railway locomotive has either the high-class workmanship or materials found in a high grade car incorporated in its design.—Yours truly,

G. P. H. DE FREVILLE.

TRIALS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent "A. E. T.," whose letter appears on page 234 of your last issue, has evidently missed the point of my letter to which he refers. He seemingly suggests that the Scottish Automobile Club could not do differently than they have done, and that any car which will not conform to the handicap formula of the Scottish Club is *ipso facto* something extraordinary. On the first question, I would refer you to the rules covering the Irish Reliability Trials, which rules allow any car selling for less than £250 to compete as a two-seater, irrespective of engine capacity; and on the second question I would mention that Ford cars, which are excluded from the Scottish trials under their handicap formula, have the largest sale of any motor-cars in the whole world.

The point of my previous letter was that primarily price is the real handicap in all reliability trials, or, in other words, the public wish to be

informed which is the best and most reliable car at the cheapest comparative cost. This fact is partially recognised in all handicap trials, but its practical utility is nullified by the Scottish Club when they demand that, irrespective of price, no car developing more than 11½ h.p., according to their arbitrary and erroneous formula, shall compete as a two-seater. I contend that if I can *bona fide* sell the public a car for £200 which will beat any other car being sold to the public for a similar sum, I should not be prohibited from demonstrating the qualities of my car because I am giving the public more h.p. than the other fellow. I recognise that technical formulæ are necessary, but such formulæ are quite secondary.—Yours truly,

PERCIVAL L. D. PERRY.

SIRENS AND EXHAUST CUT-OUTS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—The attention of the committee of the Royal Automobile Club has been called to the increase in the use of sirens and exhaust cut-outs by certain motorists, and to the annoyance and inconvenience which such a practice causes to other users of the highway, and, in accordance with a resolution passed at a meeting of the Committee on the 1st inst., I venture to appeal to motorists, through the medium of your columns, to assist the committee in the endeavour to put a stop to what may otherwise become an intolerable nuisance.

My committee earnestly request all drivers of motor vehicles who use the siren, and those who are in the habit of using the exhaust cut-out, to discontinue this practice, as the use of either is unnecessary, and their continuance must inevitably tend to arouse a not unreasonable hostility from the public.—Yours truly,

C. D. ROSE,

Chairman of the Committee of the R.A.C.

OPENING FOR GARAGE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I be permitted to encroach on your valuable space to ask if any of your readers can give me the benefit of their advice on the opening of a garage and repair shop. I mean, as to a town on any main road, where they think an opening would be beneficial to both the writer and to motor owners.

I am a stranger as to the best routes in England where a shop could be made to pay. I thought I would ask you for the benefit of your advice.—Yours truly,

M. W.

PUTTING ON NEW TYRES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Anyone who has had much of this kind of thing to do will admit that it is not a very easy matter to get the tyre on exactly straight for the valve, as although one may get it right to commence with, yet the leverage it gets to put it on the rim very often moves it a quarter of an inch, and, being new, and a very tight fit, it is impossible to move it back without partly taking it off the rim again, and this performance may be repeated any amount of times. I have seen some men cut the edges of the tyre around the valve hole so as to give a wider margin to work to, but this is not at all a smart way, and cannot add to the strength of the tyre itself. The other day I tried a dodge which I have previously heard of, and as it answers so well I give it to my friends for what it is worth. Turn the wheel round so that the valve hole is at the top, then get an old valve and drop it in the valve hole, now take the tyre and get as much of it on as possible, seeing that the edge of the far side goes under the old valve just inserted. This will keep the tyre in its correct place all the time whilst the last security bolt has been inserted, then it may be slipped out and the tube put in. There is absolutely no possibility of the tyre moving partly around whilst getting the first edge on, or when putting in the bolts; with an 880 by 120 tyre, it is not much fun making a slight mistake. Trusting this information will be useful to some of your readers.—Yours truly,

JNO. H. HALL.

WE have an inquiry for the name and address of the maker of the Arco flint tread.

MR. W. F. PARKER, of 68, St. Giles, Oxford, lost on Sunday, somewhere between Guildford and Bracknell, the top of a tool-box, and will be pleased to hear from anyone who may find the same.

BETWEEN the "Red Lion" and Harrow Weald, a lamp and bracket from a tri-car has been found. The owner can have the same by giving description and paying expenses to Mr. George Walmer, 19, Clay Hill, Bushey, Herts.

THE Miesse Petrol Car Syndicate, Ltd., of Pelham Street, South Kensington, London, S.W., inform us that they have no connection with the Turner Motor Manufacturing Company, of Wolverhampton, and that the Miesse petrol car is manufactured by the original Jules Miesse, and "also that Mr. Justice Warrington, on May 10th, refused to grant the Turner Motor Manufacturing Company an injunction with costs restraining us from using the word Miesse in connection with the cars manufactured by Jules Miesse."

THE LONG DISTANCE TRIAL OF A SIDDELEY CAR.

As we briefly mentioned in our last issue, the long distance trial of the 40-h.p. Siddeley car under the auspices of the Royal Automobile Club came to a successful conclusion on the 1st inst. with a total mileage to its credit of 10,003, of which 7,089 miles were run without an involuntary stop. From the earliest days reliability has been the prominent feature of the cars designed and built by the Wolseley Company, and the records of various trials afford striking testimony to their consistently successful performances. The trial just concluded, however, has proved to be certainly the most severe test ever yet attempted with a motor-car. The vehicle was in charge of Mr. Martin G. Duncan, the official observer for the R.A.C., and driven by Messrs. A. Farrell and G. Fletcher, who took turns at the wheel. A new and very successful feature of the trial has been the method adopted by the Club of making various towns throughout the country local centres, from which daily runs were made. In this way motorists generally have been able to follow the daily progress of the car, while public interest has been stimulated. As was to be expected, the weather has been at times very severe, while the roads in some districts were almost impassable. This was particularly the case over the routes mapped out in Devonshire and Cornwall, and it is interesting to note that the drivers, even after penetrating into the far north of Scotland, consider that the Cornish roads provided the worst travelling of the tour.

The car—a 40-h.p. Siddeley—was of the heavy touring type, and no pains were spared as regards its appointments to ensure the comfort of driver and passengers. It was fitted with a Cape cart hood extending right over the front seats, and a specially designed double-folding wind screen was provided in front. During cold weather an ingenious method was adopted whereby hot air was drawn up from the motor to warm the occupants of the vehicle. This was effected by means of a baffle plate, worked from the driver's seat, and fitted in the protecting

tray placed underneath the motor and gear-box. Another special feature must be noted in that the tyres were filled with Elastes, and it must be admitted that this had an important bearing on the result of the trial, as no stoppages from tyre troubles were experienced on the road throughout the whole of the long journey, although at times mile after mile of loose stones had to be negotiated. It was seldom that at the end of a day's run the drivers failed to find an assortment of nails embedded in the tyres.

The Trial was not without its incidents, but no stoppage had to be reported until the 2,914th mile, when the gear change lever broke. This, on examination, was found to be due to a slight flaw in the metal. After this was replaced, the car recommenced its attempt to establish a fresh non-stop record, and maintained great regularity in its daily running thenceforward until the end of the trial, with the exception of one occasion on which the car was delayed by running off the road through being bored into a ditch by a horse attached to the tail of a cart. This happened near Lancaster, and did not affect the non-stop record, as no fault attached to the driver, who was obliged to avoid what might easily have been a very serious accident. The engine was kept running until the Official Observer gave instructions to stop it, three horses having to be requisitioned to get the car out of the ditch. Another "traffic" stop occurred in Scotland when attempting to cross the famous pass of Glenshee. Here the road was found to be covered to a depth of nearly twenty-five feet with a huge snowdrift, and although attempts were made to dig a way through, the task eventually had to be abandoned, and an alternative route substituted. It was while in Scotland that a lucky horse shoe was picked up, which was promptly attached to one of the rear spring hangers and faithfully served its duty as a mascot during the remainder of the trial.

It has been suggested that the strain of driving continually day after day would have affected the health of the drivers, but so far from this being the case they find themselves now in a far better condition

physically than when they started this long tour, an experience which is also shared by the official observer. At the conclusion of the trial the working parts of the car were dismantled for examination by the Technical Committee of the R.A.C., and their report on the whole trial will shortly be issued. This much is certain, that mechanically the car has come out of the test with the highest honours.

THE TOURIST TROPHY RACE.

THE cars which the Star Engineering Company have built for the Tourist Trophy Race are of the chain-driven type. The four-cylinder engines are 4 in. bore by 5 in. stroke, the normal speed being 1,000 revolutions, at which 20-h.p. is developed. The gravity-fed carburettor is of the Star Company's automatic type, and two forms of high-tension ignition—magneto and accumulators—are provided. The change-speed gear gives four speeds forward and a reverse with the direct drive on the top, the speeds at the normal rate of the engine being 10, 20, 30, and 42 miles per hour. The cars have a long wheel base and the road wheels are shod with 875 mm. by 105 mm. tyres.

Messrs. Humber, Ltd., Coventry, have also furnished us with a few particulars of the car they have built for the event. The engine comprises four separately-cast cylinders 4½ in. bore by 4½ in. stroke. The change-speed gear, which is gate controlled, gives four speeds and reverse, the direct drive being on the third. The various ratios are 8.002 to 1, 3.9 to 1, 2.5 to 1, and 1.98 to 1. The transmission is by a cardan shaft and bevel gear to a live axle. The road wheels are carried

CLUBS AND ASSOCIATIONS

AUTOMOBILE ASSOCIATION.

THE Automobile Association patrols will be on special duty between London and Bexhill during Whitsuntide. The official route chosen by arrangement with the Crystal Palace A.C. is:—Lewisham, Bromley, Farnborough, Sevenoaks, Tonbridge, Lamberhurst, Robertsbridge, Battle, Ninfield, Bexhill.

The Automobile Association patrols will be specially mobilised for service on the Great North Road for the Motor Union meeting at Lincoln, the route being Barnet, Hatfield, Hitchin, Buckden, Stilton, Stamford.

JUNIOR AUTOMOBILE CLUB.

THE Junior A.C. held a speed judging competition near St. Albans on Saturday. The winner was Mr. C. W. Brown. Miss Agnes Wood was second, and Mr. S. W. Stewart, third. The Ladies' Nomination Sweepstakes resulted:—Mrs. C. W. Brown, driver H. Cook, 1; Mrs. Branson, driver E. A. Merskel, 2; Mrs. Carter, driver A. J. Boulton, 3.

The above illustration depicts the Winning Team of Talbot Cars at Frome's Hill, taken after the vehicles and their respective engines had been dismantled, inspected and certified as correct, with the Hereford Trophy and Medals shown in the centre.

Reading from left to right they are as follows:—1. Mr. T. W. Bowen's 10-h.p. two-cylinder, declared second in Class 1, awarded silver medal. 2. Mr. W. Stokes' 20-h.p., second in Class 3, awarded silver medal. 3. Lord Shrewsbury's 12-16-h.p., with driver G. Day at the wheel, winner of Class 2 and awarded gold medal, and finally declared winner of the whole contest, with highest marks for efficiency, and awarded the Hereford Trophy. 4. Viscount Ingestre's 15-h.p., with His Lordship at the wheel, winner of Class 3 and awarded gold medal. 5. Mr. T. H. Woollen's 12-15-h.p., with driver J. Hedge at the wheel, second in Class 2, awarded silver medal. Mr. T. H. Woollen, the general manager of Clement-Talbot, Ltd., is seen standing between the winning car No. 33 and Viscount Ingestre's No. 32.

by the axle casing, so that the live shafts have only the driving effort to transmit. The differential gear is of the straight pinion type and ball bearings are used to all parts except the engine.

The vehicle which the New Leader Motors, Ltd., have built for the event is rated at 20-h.p.; the engine is of the four-cylinder type, 3½ in. bore by 3½ in. stroke, the normal speed being 900 revolutions per min. Both accumulator and coil and high-tension magneto ignition are provided; the water circulation is by thermo-syphon, no pump being employed. The carburettor, which is of the automatic type, is gravity fed. Four speeds and a reverse are provided, with direct drive on the top speed through a cardan shaft and bevel gear to a live axle. The vehicle, which has a wheel base of 8 ft. 11 in., is shod with 32 by 3½ in. Dunlop tyres.

THREE years have been added to the life of the Canadian patents on the Dunlop tyres, which, as a result, will not expire until the year 1910.

On his arrival at Madrid, after his record run from Paris on a De Dietrich car, M. Sorel, wiring the result of his performance, attributed part of his success to the working of the Bleriot headlights he was using on the car, and particularly to the powerful Bleriot "petrol-oxygen projector," which, sending a luminous beam of light over a mile ahead of the car, enabled him to keep a pace of nearly forty-five miles an hour during the whole of the night, without danger to himself or to any other user of the road.

THE MOTOR UNION.

IN consequence of the favourable decision secured by the Motor Union recently in the Divisional Court on the question of smoke emission by motor-cars on the highway, the Legal Cases Committee have resolved to support financially an appeal by the Little Malvern Granite Company, who are members of the Commercial Motor Users' Association, against a conviction of one of their drivers by the local magistrates for that he did "unlawfully use on a highway there a certain locomotive not consuming as far as practicable its own smoke." Expert evidence was given showing that the tractor was constructed upon the most approved modern principles and could only emit smoke from a temporary or accidental cause. The Justices, however, held that the tractor did not satisfy the conditions of a light locomotive, as defined in the Act of 1896. The appeal will be heard at the Worcester Quarter Sessions.

AUTO CYCLE CLUB.

IT has now been definitely decided that the Motor-cycle Tourist Trophy race shall be held over a course starting from Peel to Ballacraigne, which is practically level. From Ballacraigne the route runs through Glen Helen up Cleg Willeys Hill. This is the most severe hill on the course, and has a bad left-angled corner, but an average 3½ h.p. motor-bicycle can easily climb it. From the top of this hill there is a gradual descent to Kirk Michael. From here, by a sharp turn to the left, the coast road to Peel is taken; this part of the course is compara-

tively easy, although there is a very bad corner, "The Devil's Elbow," about half way. Altogether the course is an ideal one for the motor-cycle, and competitors should have no difficulty in maintaining a fair rate of speed on the fuel allowance, viz., ninety miles to the gallon for single cylinders, and seventy-five miles to the gallon for twin cylinders. This course will be covered eleven times, making a total distance of 175 miles. The special petrol provided by the club is known as the R.A.C. brand and has a specific gravity of .715 to .725. Those competitors who are going over at Whitsuntide to practise on the course are urged to use extreme care, because part of the course is the same as that used by the cars. They are also particularly requested not to use cut-outs on their machines, nor to practise on the course on Sundays; any infringement of this regulation will render the machine and driver liable to instant disqualification.

MANCHESTER.

THE following are the official awards in connection with the run of the Manchester A.C., fully reported in our last issue:—1, J. Higginson, jun., gold medal; 2, E. J. Woolley, silver medal; 3, F. Eckersley, bronze medal.

Considering the hilly nature of the route, which was 132 miles long, the fact that twenty-seven out of twenty-eight starters arrived at Bettws-y-Coed before seven o'clock in the evening speaks well for the manufacturers of the modern car; in fact, so small a percentage of marks was lost under the head of "reliability" that the factor mainly governing the result was economical petrol consumption, as will be observed from the following list:—

MARKS GAINED AND DETAILS OF PETROL CONSUMPTION.

Entrant.	Type of Car.	No. of cylinders.	Petrol used in gallons (132 miles)	Weight of car with load in tons.	Petrol consumption per ton mile in gallons.	Marks for petrol cons. max. 200.	Marks for reliability, starting, &c. Max.	Total Marks.
1. J. Higginson, jun.*	80-100-h.p. De La Buire	4	8.0	2.3375	.0259	200	800	1,000
2. E. J. Woolley...	12-h.p. Lancheater	2	5.625	1.55	.0275	188.6	797	985.6
3. F. Eckersley...	12-h.p. Lancheater	2	6.0	1.6875	.0289	192.6	780	972.6
4. H. Hollindrake*	35-50-h.p. De La Buire...	4	8.125	2.025	.0304	170.8	800	970.8
5. J. Makin*	18-24-h.p. Belsize	4	6.968	1.725	.0306	169.4	800	969.4
6. G. J. Crawford*	20-h.p. Lancheater	4	6.5	1.5625	.0315	164.7	800	964.7
7. A. E. Crowdy*	18-h.p. Siddeley	4	6.475	1.5375	.0319	162.7	800	962.7
8. H. Bright*	10-12 h.p. Argyll	2	4.5	1.0375	.0327	157.8	800	957.8
9. Joshua Hall*	18-28-h.p. Mercedes	4	6.75	1.4875	.0343	150.9	800	950.9
10. J. Hoyle Smith	18-24-h.p. Belsize	3	8.0	1.7125	.0358	146.6	799	945.6
11. H. P. Bury*	24-30-h.p. Belsize	6	8.468	1.775	.0361	143.6	800	943.6
12. S. Wallwork	12-h.p. Lancheater	2	7.0	1.4625	.0363	143.1	787	930.1
13. W. J. H. Stonier*	18-24-h.p. Belsize	4	9.0	1.6875	.0404	128.5	800	928.5
14. R. Jackson*	40-45-h.p. New Eagle	4	10.5	1.8625	.0427	121.5	800	921.5
15. M. Beaver	12-14-h.p. Clement-Talbot	4	7.125	1.2	.0449	115.3	797	912.3
16. Colin Mather	18-24-h.p. Belsize	4	9.1875	1.35	.0374	138.8	772	910.8
17. F. R. Hesce*	30-35-h.p. Daimler	4	13.406	2.1375	.0475	109.2	800	909.2
18. J. A. Bennett...	20-31-h.p. Belsize	4	9.375	1.475	.0481	107.7	798	905.7
19. F. G. Cundy	40-h.p. Napier	6	10.437	2.087	.0377	136.9	761	897.9
20. J. Arrowsmith*	18-24-h.p. Horbick	6	11.0	1.55	.0537	96.5	800	896.5
21. D. A. Parkyn...	7-h.p. Motor Manufacturing Co.	2	7.625	1.075	.0537	96.6	798	894.6

The car of J. A. Morris was withdrawn from the competition, and the following were disqualified either for shedding passengers or for non-compliance with the rules in the opinion of the judges, viz.:—J. B. Mallalieu, G. Crosland Taylor, L. Sumner, William Kay, William Hyde, and J. Duckworth.

An asterisk denotes that a non-stop certificate has been awarded.

The fourth run of the Manchester Automobile Club was held on Saturday, the destination being Haddon Hall. The choice of three routes was given in the letter to the members notifying the arrangements, and by adopting the suggestions of the committee a procession of cars on any given route was avoided. Compared with certain portions of the course near Blaenau Festiniog and Dolwyddelen, traversed on the previous Saturday in the reliability run, the gradients between Whaley Bridge and Buxton, or the latter town and Macclesfield, were not difficult to negotiate, for they only varied from about 1 in 26 to 1 in 15, and so by half-past four some twenty cars were parked on the greensward by the meandering Wye, in close proximity to the Hall, and about sixty members and friends partook of tea in the rooms contiguous thereto. By six o'clock cars were leaving the precincts of this historic home of the Vernons, to pursue their various ways homewards. Among the members present were Messrs. J. A. Morris (president), J. Hoyle Smith, A. J. Jones, J. Duckworth, Brownword, D. A. Parkyn, J. Higginson, junr., S. Wallwork, C. Frost, H. Frost, C. Ocleston, H. Hollindrake, Herbert Bright, J. Makin, R. Scott, and Stone.

THE COMMERCIAL MOTOR USERS' ASSOCIATION.

A MEETING of the Executive Committee of the Association was held last week, when it was reported that a number of motor manufacturers had proposed certain meets of commercial motors in the provinces, the first of which was to be held at Reading, on June 15th, 1907, and that they would like the co-operation of the Association. The idea was

generally approved, and a Sub-Committee consisting of Messrs. Charles Wheeler, Iltid Witherington, and H. Thompson Lyon, was elected to represent the Association in the matter.

The question of tram-rail imperfections in regard to their damaging effects upon commercial motors was considered, but it was resolved that the matter should be deferred until a case occurred.

The secretary reported as to an action against Messrs. Wild and Robbins by the Kensington Borough Council in respect of the annoyance to the inhabitants by the use of heavy motor vehicles in that borough. He reported that the solicitor acting for the Association had had a conference with the solicitor of the Kensington Borough Council. The decision of the Legal Cases Committee of the Motor Union in respect of this matter was reported. It was resolved that a letter should be sent to the members calling attention to what had occurred, and warning them as to worn gears, so as not to be liable to attack as being considered a nuisance.

EAST LANCASHIRE M.C.C.

THE East Lancashire Motor Cycle Club had its second annual hill-climbing competition for the Harold Eccles Challenge Cup at Sawley Brow last week. The event created a good deal of interest, entrants from Clitheroe, Haslingden, Accrington, Preston and Blackburn drawing followers from those districts. Sawley Brow is accounted a stiff climb, and although its gradient is given in the contour road-books as averaging one in ten, actually from measurements taken by responsible local authorities the gradient in places touches 1 in 6.3. The best performance was that of Mr. Weldon, of Preston, who drove the 3½-h.p. Triumph

entered by Mr. H. H. Edmondson. He won the cup and medal on his lap, and also the special medal for fastest time. At the conclusion of the event the winners repaired to Clitheroe, where the weights were confirmed, and the prize-winners announced as follows:—1, Mr. Weldon, Preston, driver for Mr. H. H. Edmondson, Preston; 2, Mr. D. Duckworth, driver of the 3½-h.p. Ariel for Dr. Nutter; 3, Mr. A. N. Orr, Preston, on a 3½-h.p. Triumph. Passenger class: 1, Mr. J. Scott, 4½-h.p. Humber tri-car; 2, Mr. D. Strong, 4½-h.p. Humber tri-car.

Dr. Stephenson and Mr. Arthur Birtwistle acted in the capacity of judges, and placed at the disposal of the club cars in which to convey the officials to the venue. Messrs. F. H. Wilkinson and G. Nuttall officiated as marshals of the course, and Mr. R. L. Cowburn was time-keeper. Mr. P. Isherwood undertook the duties of starter.

YORKSHIRE CLUB.

ON Saturday the third annual hill-climbing competition, under the auspices of the Huddersfield branch of the Yorkshire Automobile Club, took place for the second time over a mile and 840 yards course on the way from Meltham to Isle of Skye, on a steep section. The day was fine, and a large number of people turned out to witness the races, which were conducted in the presence of the police. The road is very free from heavy traffic, and one of the most suitable in the district. There were four classes for small, medium, and large cars, and a cup was offered for the best performance. The following are the results:—Class A, for single-cylinder cars (five starters): J. E. Dyson, Huddersfield, 3.64-h.p. De Dion, time 5 min. 58.1-5 sec., points 90; class B, for two-cylinder

cars (seven starters): W. Singleton, Kirkburton, 8-33-h.p. De Dion, 4 min. 55 sec., points 98; class C, for three or more cylinder cars up to and including 20-h.p. (nine starters): A. M. Whiteley, Huddersfield, 16-66-h.p. De Dion, 3 min. 28 3-5 sec., points, 99; class D, for three or more cylinder cars over 20-h.p. (five starters): D. S. Crowther, Huddersfield, 32-h.p. Napier, 1 min. 54 4-5 sec., points 99-8.

D. S. Crowther took the cup for the best performance. The others took medals. There were thirty-one entries in all, and only seven non-competitors. Mr. W. H. Jessop, president of the Huddersfield branch,

The Isotta-Fraschini Limousine recently supplied by Messrs. Hall, Capris and Co. to Lady Paget.

acted as referee; Mr. F. A. Reed was the starter. Mr. A. Fattorini and two assistants were the timekeepers, and Mr. E. Gordon Learoyd was the secretary.

On Saturday last the Yorkshire Automobile Club held a meet at Helmsley, where tea was served at the Black Swan Hotel, after which the party visited various objects of interest in the vicinity.

HERTFORDSHIRE.

A FIFTY miles Fuel Consumption Trial was carried out by the Hertfordshire County A.C. on Saturday. The route was from Hatfield to Biggleswade, via Hitchin and Henlow, and return. There were nine starters—six cars, one tri-car and two motor-bicycles. All finished the complete journey with the exception of one car, which was delayed over the maximum time allowed for the journey through tyre troubles.

The following are the results of the competition in their order of merit:—

No.	Car.	Driver.	Miles per gallon.	Gallons per ton mile.
1.	16-20-h.p. Rover	F. J. Jenkins	30.4	.021
2.	40-h.p. Napier	H. C. Tryon	21	0.022
3.	8-h.p. Rover	W. A. Pearkes	30.9	.029
4.	16-20-h.p. Sunbeam	C. McWhirter	20.1	.031
5.	10-h.p. Argyll	J. E. Young	Delayed through tyre trouble.	

MOTOR-CYCLES.

1.	9-h.p. Riley tri-car	H. R. McLatchie	57.25	.050
2.	3½-h.p. Minerva	W. S. Stafford	111	.055
3.	3½-h.p. Triumph	J. S. Harwood	105	.060

The carrying out of the trial and the judging were performed, as in the past two years, by Mr. D. Corse Glen, and the hon. secretary, Mr. W. Whittall.

ESSEX.

AN open hill-climb was held at Lippett's Hill, High Beech, on Saturday. The winners, decided on handicap, were:—

Class 1. (Passenger Motor-cycles).—A. Carpmal, jun., 9-h.p. Riley, scratch.

Class 2. (Single-Cylinder Motor-bicycles).—J. Marshall, 3½-h.p. Triumph, 11 sec.

Class 3. (Multi-Cylinder Motor-bicycles).—W. G. Minnies, 5-h.p. twin Vindec, 19 sec.

Class 4. (Members' Cars).—E. H. Richards, 18-24-h.p. "J.P.," 15 sec.

Class 5. (Motor-bicycles only, with stop and restart).—Open, T. Hulbert.

Members, E. Varney, 2½-h.p. Crownfield, 40 sec.

KENT.

A MEETING of the Kent Automobile Club was held at Canterbury on Saturday, the fixture including a club luncheon at the County Hotel, and a committee meeting after the lunch. There was a good attendance, nearly forty members and friends being present. After luncheon the Chairman, Mr. J. C. Morgan, pointed out that the club was the county club, and that one of its chief aims was to create a better feeling between

motorists and other users of the highway. Sir George Collard, who replied on behalf of the guests, said that he realised that the motoring movement was growing enormously, and he conceived it to be the duty of authorities to see that the roads and streets were kept in as good a condition as possible, whilst he equally conceived it to be the duty of bodies like the Kent Automobile Club, by their example and influence, to see that the roads and streets were used in a proper and considerate manner. He was afraid that the streets of Canterbury were rather narrow, but he was glad that the club had been able to hold such a successful meeting in the Cathedral city.

BLACKHEATH.

A MEET of the Blackheath Automobile Club was held on Saturday at the Camden Hotel, Pembury, where about twenty members and friends sat down to tea. The run down and back was a delightful one, the Kentish scenery being at its best. Among those present were Messrs. W. F. Butcher, L. Beadle, O. V. Flather, A. Jackson, T. E. Quick and W. Whiteway.

CHESHIRE.

A SUCCESSFUL meet—the first since the formation of the club—was held at the Brine Baths Hotel, Nantwich, on Saturday, when the members and their friends were entertained by the Chairman of the Committee, Mr. A. G. Jeans, J.P. The President of the club, Mr. Thomas H. Jackson, J.P., attended in company with thirty-two other members, the total gathering including guests numbering close upon 150.

Particulars concerning the club can be obtained from the hon. Secretary, Mr. J. Alfred S. Hassal, 6, Lord Street, Liverpool.

HEREFORDSHIRE.

MR. WILFIRD GROOM, hon. sec. of the Hereford A.C., writes:—Please announce in your next issue that in Class 3 of the Frome's Hill Climb, Mr. Easthead's Sunbeam won the certificate, not the car first mentioned, also that Mr. H. C. Holder won the silver medal in class 5, and Mr. Brodtmann the bronze, not *vice versa*.

MOTOR YACHT CLUB.

THE Motor Yacht Club season opened on Saturday with a race on Southampton Water. On the handicap the results were:—1, Mr. Nicholson's Squirt; 2, Mr. Summer's Phoebe; 3, Mr. S. F. Edge's Napier IV., and Captain Cumming's Commander.

On Thursday last week two of the Lurin and Klement Standard 8-9-h.p. Cars accomplished a splendid non-stop run from London to Holyhead.

The car shown above was driven by an amateur, and the other by Messrs. Lurin and Klement's regular driver, Mr. Toman. The two cars left the Lurin Klement depot in Tottenham Court Road, W.C., just after six o'clock, and, notwithstanding the wretched weather which endured all day, Holyhead was reached without a single stop, the amateur completing the distance of 236½ miles in 10 h. 10 min., and the firm's car in 10 h. 19 min.

SCOTTISH MARINE MOTOR CLUB.

THE Scottish Marine Motor Club, Limited, has been formed out of the Glasgow branch of the British Motor Boat Club. Lord Inverclyde and Lord Angus Kennedy have been elected commodore and vice-commodore respectively, and Captain Leeschallas, of Ardentinn, rear-commodore. Mr. Gibson, of Messrs. Crawford, Herron, and Cameron, writers, is the hon. secretary, and Mr. Hart the hon. treasurer. Messrs. Cullum, Carswell, jun., Low, and Dunlop are stewards. The season

will commence with an opening cruise on June 8th; regattas on July 6th and August 10th, with events for all classes of motor-boats; and a closing cruise on August 31st.

LORD BATTERSEA has consented to become a patron of the North London A.C.

THE Motor-Cycle Union of Ireland held an open hill-climbing meet on Saturday.

AT the annual meeting of the North Wales Automobile Club a membership of 96 was reported.

The New 18-24-h.p. Car which the Swift Motor Company have just put on the market. The vehicle is of British construction throughout, the engine being of the firm's own design and construction.

THE run of the Southern Motor Club to Cambridge and Lincoln at Whitsuntide has been cancelled in favour of a tour to Bexhill.

THE Sussex Motor-Boat Club held its opening cruise on Saturday, luncheon being previously taken at the Grand Hotel, Brighton.

THE Bristol M.C.C. is being formed, with Mr. J. B. Kellar as president and Mr. H. W. Gent, 37, Aberdeen Road, Bristol, as hon. secretary.

THERE are nearly 300 motor-cyclists in the Leicester district, and Mr. T. Townsend, the Old Castle Inn, The Newarke, Leicester, is endeavouring to form a local motor-cycle club.

UNDER the auspices of the Engineering and Scientific Association of Ireland, Mr. D. J. Smith will read a paper on "The Steam Car," at the Royal College of Science, at Dublin on the 27th inst.

THE Liverpool Automobile Club will hold their next club meet on Saturday, May 25th, at Hooton Hall, Hooton, near Chester, by permission of the directors of the Hooton Park Club, Ltd.

A GENERAL meeting of Bedfordshire automobilists for the purpose of formally founding a club for the county will be held under the auspices of the Motor Union, at the Swan Hotel, Bedford, on the 29th inst. Communications for the club should be sent to the hon. secretary, *pro tem.*, Mr. Gregory J. M. Whyley, Dame Alice Street, Bedford.

CASES UNDER THE MOTOR CAR ACT.

EXCEEDING LEGAL LIMIT.

MR. HERBERT ALDIN SMITH, a director of the Firm of Smith and Sons, was summoned, at Marylebone, for driving a motor-car in Regent's Park at a speed exceeding ten miles an hour. Mr. A. Gill, barrister, prosecuted and Lord Russell defended. Two Park constables timed the defendant over a measured furlong at 11.20 p.m. on April 11, with the aid of lamps and stop-watches, and, according to their calculation, the car travelled at a speed of over nineteen miles an hour. A third constable endeavoured to stop him by waving two white flags, but he drove on, and had to be stopped by a constable of the Metropolitan police. He did not stop, he said, because he could not see in front of him, owing to the plate-glass in front of the car. He also explained that he was the inventor of a speedometer, which was affixed to the car, and showed it to the officers, pointing out that he had been travelling only a fraction over ten miles an hour. In answer to the summons Mr. Smith contended that his speedometer was far more reliable than the officers' stop-watches and their system of timing. Mr. Plowden: Is it infallible?—Mr. Smith: Yes. Mr. Plowden declined to go into the rival merits of the stop-watch and the speedometer—and found on the other evidence in the case that the summons had been proved, imposing a fine of 40s. with costs.

NO LICENCE.

Among the motor cases heard at the Chichester County Bench on Saturday was one in which Newton James Clayton, of Selsey, was summoned for driving a motor-cycle and failing to produce his licence to a police constable at Bognor. P.C. Aliff having given evidence, in which it was shown that defendant said he had left the licence in another jacket, Mr. E. B. Wannop, for defendant, suggested it was a case which might be dismissed on payment of the costs. Mr. W. P. Cogan, for the police, said he had no objection to this course, which the Bench consented to adopt.

AT Chichester, on Saturday, five motorists were fined for various offences. Four other cases were heard at Horsham. One of the latter sent a blank cheque, which was filled in to the amount of £2 8s. 8d.

SPEED TRIALS AT CLIPSTONE.

EACH of the last two years that the Nottinghamshire Automobile Club has held speed trials on the Clipstone track of the Duke of Portland the weather has been perverse. But on Saturday last, the third occasion of the trials, it was delightful, with the result that there was one of the best meets yet held in the Midlands.

The officials were:—President, Mr. Chas. Hardy; judges, Lieut-Colonel R. L. Birkin, D.S.O., and Captain R. K. Bagnall-Wild, R.E.; clerks of the course, Messrs. W. Don Foster, A. Barlow, and R. L. Jones; starters, Messrs. G. H. Kirk and W. D. Wells; clerks of the scales, Messrs. H. D. Snook and A. N. Lee; marshals, Messrs. J. Cowen, J. C. Buckley, A. R. Atkey, R. G. Hogarth, and B. W. Winter; timekeepers, Messrs. Chas. Perry, J. H. Scothern, and G. E. Batcher; and hon. secretary, Mr. Booth Granger.

The three events resulted as follows:—

THE WILSON CHALLENGE CUP.—Flying kilometre handicap for tourist petrol cars: open to members of the club. First prize, Wilson Cup and Gold Medal; second, Silver Medal.

The 20-h.p. Vulcan Car which has been entered by Capt. Corbet for the Tourist Trophy Race.

After the races a dinner was held at the Swan Hotel, Mansfield, when several toasts were honoured, including that of "The Nottinghamshire Automobile Club," proposed by the Mayor of Mansfield, and "The Visitors," for whom Captain Bagnall Wild and Mr. S. F. Edge replied.

IN view of the many motorists who pass through London during holiday time, Messrs. Friswell, the motor-car dealers, wish it to be known that they are keeping their establishment at 1, Albany Street, Regent's Park, N.W., open both day and night during Whitsuntide. This will enable those who require repairs, garage facilities, &c., to procure same without delay.

FORTHCOMING EVENTS.

MAY.

SATURDAY, 18TH.

Motor Union meeting at Lincoln.
 Entries close for the R.A.C. "Graphic" Trophy.
 Cleveland Branch Yorks. A.C. run to Hutton Hall.
 Meeting of the New Forest A.C. at Beaulieu.
 Southern M.C. run to Bexhill.
 Southend and District M.C. tour to France commences.

MONDAY, 20TH, AND TUESDAY, 21ST.

Crystal Palace A.C. meet at Bexhill.

WEDNESDAY, 22ND.

Cardiff M.C. reliability run.
 Start of the Irish A.C. reliability trials—closing on the 25th inst.
 Tar-spreading tests on the Hounslow and Staines road.

THURSDAY, 23RD.

Limerick M.C. hill climb at Windy Gap.

SATURDAY, 25TH.

Last day for practising on the Isle of Man course.
 Aero Club race for the Harbord Cup at Ranelagh.
 Mr. F. A. Bolton receives the Derby, Leicester, Mid-Staffs and
 Notts A.C. at Oakamoor.
 Reliability trial of the Ipswich and East Suffolk A.C.
 South Devon A.C. hill climb at Tavistock.

THURSDAY, 30TH.

R.A.C. Tourist Trophy and Heavy Touring Car Races.

JUNE.

1ST.—Entries close for Henry Edmunds Challenge Trophy.

22ND.—Southern Motor Club's open hill climb on Captain Kydd's Hill, East Grinstead.

JULY.

6TH.—Inaugural races on the Brooklands Track.

13TH.—Entries for R.A.C. commercial vehicle trials close at ordinary fees.

AUGUST.

20TH.—Open competition for light cars organised by the Essex Motor Club over a 200 miles course.

SEPTEMBER.

9TH.—Industrial Vehicle Trials commence.

ROAD REPORTS.

DURHAM.—The Durham County Council are shortly commencing the re-building and widening of several bridges in the county as follows:—Ruby Beck Bridge, at the west end of Staindrop village, two bridges in Lancaister village near the church, bridge on the Newcastle and Sunderland road at the junction of the road to South Shields. Motorists are asked to take other routes where possible, and, if they find it necessary to cross these bridges, to use special care in driving.

LLANDAFF.—The Llandaff District Council is considering the suggestion of their surveyor that a quarter of a mile of road should be laid with a damp-proof course placed between the ballast and the top metalling.

DORCHESTER.—The Dorchester Rural District Council had before them a complaint forwarded by the county council from the War Office (Army Motor Reserve), with reference to the condition of the roads within a radius of about seven miles from Weymouth, over which motor-cars were used in a recent staff-ride. The rough condition of the surfaces was a subject of general complaint in the reports of the officers of the Army Motor Reserve. Tyres which were in good condition at the commencement of the ride were cut by the loose flints and almost ruined. The chairman of the rural district council said it struck him that the proper answer to give to the complaints of these officers was that if it was thought desirable for Imperial purposes that the rural districts should be provided with first-class motor tracks the district authorities must look to the Imperial authorities to pay the expense. It was decided to send a reply to this effect.

AMONG recent orders for Napier cars secured by Messrs. S. F. Edge, Ltd., are a 60-h.p. six-cylinder chassis for Sir Marcus Samuel, a 40-h.p. chassis for Field-Marshal Earl Roberts, and a 40-h.p. landaulet for Dr. W. F. Abbott, of Hereford.

ONE of the New Engine Company's cars fitted with a landaulet body was recently successfully driven up Porlock Hill, Devonshire, by Mr. J. C. Mort. He started alone, but, finding the car going strongly, he picked up several passengers, the vehicle finishing the climb with five aboard.

PUBLIC MOTOR SERVICES.

THE total receipts taken on the motor-buses at Eastbourne for the week ending the 4th inst. were £135 8s. 9d., and the total number of passengers carried 26,684.

AN auspicious beginning has been made by the motor-bus service from Stranraer to Drummore.

CONSIDERABLE improvement in the motor-bus service at Ryde, Isle of Wight, is reported, but complaint is still rife among visitors that Ventnor is not similarly served.

ONE hundred residents having, through the Duke of Westminster's representatives, petitioned the Westminster City Council asking them to memorialize the Home Secretary desiring him to restrain motor-omnibus companies from sending their vehicles through Eaton Square; the subject has been before the Law and Parliamentary Committee, who at Thursday's Council meeting reported that numerous complaints of a similar nature have been received from other parts of the city, and that it would be an "undesirable precedent" to memorialize the Home Secretary on behalf of the inhabitants of a particular area. They however, intimated that they have under observation the effect of the regulations issued by the police governing the licensing of motor-omnibuses.

POLICE TRAPS.

AT Friar's Oak, Sussex, about ten miles from Brighton, is a police trap, where motorists should be careful.

SOME of the roads leading from Wolverhampton are being infested with police traps.

MANY of the motor traps in Cheshire extend over five or six miles of quiet country road.

THERE is a measured mile near Haddington, upon which several tourists have lately been trapped.

THE village of Trefnant, on the main road from Mold to Rhyl, now has its police trap.

A POLICE trap has been set up on Bromley Common. Several victims have already been caught.

SEVERAL traps have been notified on the Great North Road, including Shilton, Alconbury Hill and Buckden.

ON the North Parade, Horsham, motor-cars are now being timed by the police.

THERE is a police trap in frequent operation at Westhampnett, those caught therein being taken to the Chichester court.

THE chief constable of Blackpool gives a timely warning to motorists not to infringe the law with regard to speed during the holidays.

NO less than four police traps have been working lately in the Lewes district—often simultaneously. They are located on Dicker Common, and at the Arlington cross roads—on the way from London to Eastbourne. There is another at the Berwick cross roads on the Lewes-Eastbourne road, and a fourth near the Swan inn, Chorley, on the Lewes-London road.

BUSINESS NEWS.

MESSRS. ROWLAND BARNETT AND COMPANY, LTD., of 3, Hanover Square, Newcastle-on-Tyne, have been appointed agents for the sale of Weigel cars for Northumberland and Durham.

ON Wednesday the Northern Automobile Company, Ltd., held their monthly auction sale at the Oak Lane Garage, Bradford.

NOW that Spain looms so largely in the public eye, the appended extract from a letter recently received by the Dunlop Company is not without interest. "I have recently returned from a somewhat extended tour in Spain on my 30-40-h.p. Daimler. In many parts we penetrated the roads are almost indescribable, consisting of very deep winding ruts caused by the ceaseless mule-cart traffic, hundreds of miles of endless unrolled stones, and frequent river-beds, either dry or hidden by raging torrents of water. Obviously, under those conditions, the excessive strain on tyres and continual risk of puncture cannot but result in a good deal of trouble; but, in spite of all this, you will be interested to hear that a pair of Dunlop studded non-slipping covers, 880 mm. by 120 mm., ran throughout the trip without even so much as wanting to be pumped up."

THE two six-cylinder Siddeley cars which will compete in the Herkomer Touring Trophy competition have been entered by Mr. Lionel de Rothschild and Mr. Vere Key-Seymer, respectively.

DURING his recent visit to Italy, King Edward VII. made use of two Daimler cars daily.

MESSRS. R. REYNOLD JACKSON AND COMPANY, LTD., have appointed Messrs. Trackson Bros., Ltd., Brisbane, agents for the Jackson cars in Australia.

MESSRS. S. SHERMAN AND SON, of 57, New Compton Street, London, W.C., are making a speciality of repairing damaged motor-car lamps.

MESSRS. S. F. EDGE, LTD., have sent us a photo of the 40-h.p. six-cylinder Napier car with double landaulet body they have recently supplied to the Right Hon. A. J. Balfour for town or country use. The vehicle is magnificently finished and is fitted with two extra seats inside, and has a removable canopy.

MESSRS. G. T. RICHES AND COMPANY, of 19, Store Street, London, N.W., have been appointed by Messrs. C. A. Vandervell and Company their wholesale agents for the West End of London.

COMMENTS.

BALLOONING and travel above *terra firma* is becoming a holiday pleasure with many sportsmen. At Easter several notable ascents were made from the private grounds of the country, and this Whitsuntide, despite the chilly air and coolest showers, news of similar adventures comes from various parts of the country. Sir John Shelley has been entertaining a party at Avington Park, near Winchester, during the Whitsuntide, for a ballooning expedition. Arrangements were made with the local gas company for an ascent of three balloons on Saturday, but the wind was too high, and it had to be abandoned. The ascent was made on Monday afternoon, however. In the Hon. Mrs. Harbord's balloon, the *Nebula*, were the owner, Lady Shelley, the Hon. C. S. Rolls, and Major Baden-Powell; in the *Venus* were Mr. and Mrs. Moore-Brabazon and Mr. Orr-Ewing; and in a third balloon Professor Huntington, Miss East, and Sir John Shelley. The balloons sailed away in the direction of Portsmouth, and all the passengers subsequently returned safely to mother earth. There was a time when country gentlemen, wishing to give their friends an exceptional pleasure, arranged for automobile rides. Now that motor-cars have become the commonplaces of travel, the balloon provides a variant on the ordinary experiences of mankind.

Cars in Portugal.

Not only is Spain becoming an important factor in international automobile business, but Portugal also is becoming an importer of cars. In 1903 only twenty-six motor vehicles were taken into the country for regular service; the following year the number rose to thirty-four; in 1905 to sixty; and in 1906 to ninety, of a total value of £51,979, as well as three chassis, upon which, for the first time, the carriage builders of Portugal were to place bodies of native origin. Of the ninety cars received last year, fifty-seven were supplied by France, fourteen by Italy, seven by Belgium, six by Germany, five by Great Britain, and Spain sent a solitary one. The figures are not large, but they are significant of the development of a new market for makers.

Public Notification of Speed-restricted Areas.

OUR reference last week to the necessity of those local authorities which have secured the Local Government Board's sanction for the reduced speed of motor-cars giving prominent notification of such restriction has received further evidence in a case just heard at the Retford Police Court. A motor-cyclist from Rotherham, who was unaware of the fact that the speed of motor-cars in certain thoroughfares of Retford had recently been limited to ten miles an hour, was summoned by the police for riding beyond that speed and also in a manner dangerous to the public. The case was heard in the absence of the defendant, who did not arrive until its conclusion. He was then fined in each case, although there was no evidence to show

that the authorities had made any notification of the permission of the Local Government Board for the imposition of the reduced speed limit. Such restrictions should certainly be made clearly known in the thoroughfares to which they apply, otherwise injustice to strangers will be the only result. The point has received added importance lately, as the number of these speed-restricted areas has increased, and is one of which the automobile organisations in these districts should take especial note.

The Holidays.

DESPITE the unseasonable and unreasonable character of the weather during Whitsuntide, motorists were prominent on the landscape and managed to get a fair amount of enjoyment between the showers. Many of the London correspondents of provincial journals have drawn attention to the fact that the King, the Prince and Princess of Wales, and the Duke and Duchess of Connaught all adopted the automobile when they abandoned London for the holiday. In the provinces the garages generally did good business, not only in storing cars for visitors, but in hiring them for parties seeking fresh fields and pastures.

High Hedges.

IN connection with the risks that travellers run by reason of untrimmed hedges that exist on the roadside, an object lesson has just been brought to our notice which suggests the necessity for local authorities to be made fully aware of the dangers of such growths. On Sunday a serious accident occurred at Catterick Bridge, near Richmond. A motor-car driven by Mr. J. Nattras, of Stockton, was proceeding *via* Scorton to Richmond when, at the four lane ends near the hotel at Catterick Bridge, it came into collision with a motor-cycle. The roads cross each other at sharp angles, and owing to the high hedges neither of the drivers could see the approach of the other vehicle. Considerable injuries were inflicted on the passengers, and both machines were very much damaged. The accident emphasises the necessity of local authorities obeying the statutes which enjoin that landowners shall attend to such matters, and that the local authorities shall see that no neglect of such duty is allowed.

The Irish Trials.

ON Wednesday the Irish Reliability Trial commenced with a run of 150 miles. A start was made from Dublin at 8 p.m., and three hours later the cars were timed to reach Newry, where a stop of one and a quarter hours was enforced. Portrush was reached shortly before 5 p.m., and there the capacity of a dozen hotels was taxed to the utmost. There are no fewer than seventy-one entries, the first five being the 6-h.p. Rover, the 7-h.p. Star, the 8-10-h.p. Rover, the 9-h.p. Adams-Hewitt, of English make, and the 10-h.p. Chambers—a local production. The entries are classified into two divisions, Section II. being restricted to members of the R.A.C. or affiliated clubs, and driven by them or a member of the family; Section I. includes all the trade entrants. Further, there are

eight classes separated by distinction of price. Of the seventy-one vehicles the 40-h.p. Ford and the 40-45-h.p. Hotchkiss have six-cylinders, and single-cylinder vehicles are represented by the Rover, Adams-Hewitt, and Cadillac; double-cylinder cars by the Star, Chambers, Swift and Darracq; the Turner-Miesse steam car is the solitary example of a three-cylinder vehicle. All the other entrants are of the four-cylinder type. With regard to tyres, the Continental and Dunlop are most largely represented, and cars are also fitted with the Palmer tyres. Mr. Watson's 22-30-h.p. Berliet in Class F has Sirdar tyres, and the 15-h.p. Ford is provided with the Ajax on both front and back wheels. Of the fifty-five cars in Section I. eighteen use Carburine, fifteen Shell spirit, thirteen Pratt's, four Bowley's, and two each Borneo and Giant motor spirit, the steam car employing paraffin and Shell spirit as fuel. Owing to going to press ere the conclusion of the first day's run we are compelled to reserve a report of the Trial till our next issue. The event should do much for the movement in Ireland.

The Hotchkiss Six-Cylinder Car which is at present undergoing a 10,000 miles Reliability Trial, outside the Clinton Arms Hotel, Newark.

A New Dust Preventive.

ON Thursday last we had an opportunity afforded us of testing the qualities of "Hahnite" as a dust preventer, when a patch of road of 100 yards in length, crossing Barnes Common, was submitted to public inspection. This road had been treated to a coating of "Hahnite" three weeks previous to our visit, and proved to be in a dustless condition—in very strong contrast to the road leading to it. In conversation with the local road surveyor, we were informed that since the treatment with this preparation the road had not required watering, nor had any surface dust been taken from it; whereas, in the case of the ordinary road, it was found necessary to water from three to seven times per day, according to the state of the weather. He further informed us that he had gone into the cost of treating the road with "Hahnite," and found the expense per annum worked out less than the outlay necessary for merely watering the roads. Taking into consideration the advantages of "Hahnite" as a preventive of dust, a preserver of the road, a healthy disinfectant, and an assurance against skidding, to say nothing of its economy, there is no doubt that this production should commend itself to everyone in authority in residential neighbourhoods where there is much vehicular traffic, whether by horses or motor-cars.

Exploring Africa by Motor-Car.

MR. B. J. F. BENTLEY, who has already gained some fame as an explorer in Africa and other parts, started on Saturday last for an overland trip to Abyssinia in connection with a special commission he has undertaken for the Urban Bioscope Company. Mr. Bentley has made similar journeys before, but his passage across the desert has previously been made in the orthodox way on camels. His latest trip, however, will be undertaken with an 18-h.p. Siddeley car. The party are travelling *via* Dover, Calais and Marseilles, thence by steamer to Djibouti. From there the real difficulties of the expedition will be encountered as the car proceeds on its way to the centre of Africa. The full itinerary is as follows:—Djibouti, Galamo, Arabderi, Dullul, Kallelu, through the Makanesa Mountains, Harral, Jebel-Ahmar, Hawash Gorge, Zuqualla Mountains, Adda, Addis-Abeba. Mr. Bentley, who was entertained by the Wolseley Company at lunch on Friday last week, expects his tour to extend to seventy days out and home, the return journey being made from Addis-Abeba to Khartoum, and thence, *via* the Valley of the Blue Nile, to Wadi Halfa, Cairo and Alexandria.

Ways of Travel.

OPENED by Colonel W. J. Bosworth, and varied in its collection of exhibits, the Travel Exhibition now in progress at the Royal Horticultural Hall, Westminster, provides a suggestive ramble for the man who stays at home. Here are shown the equipments necessary for adventures in Iceland or Patagonia, and the requirements essential to the enjoyment of travel in all the continents known to man. The display also suggests many pleasant places in our own country which are unknown to the average man or woman, and tells how they may be reached with the minimum of discomfort. On this point the motorist may proudly assure his friends of his independence of time-tables and the long waits occasioned by the intervals at which trains run.

Level Crossings.

NOTHING could have been more admirably stage-managed in demonstration of the inconvenience of the level crossing on public highways than the passing of a Midland Railway train over the High Street, Lincoln, on Saturday. This led to the procession of cars being "held up," and the leading officers of the Motor Union were able to stand and contemplate the scene. Such survivals of the last century are familiar enough in country places, but the way in which this particular crossing dissects the main thoroughfare of such an important city as Lincoln is really remarkable, and Saturday's experience should stimulate the Motor Union to renewed activity in that direction. In this connection we are glad to know that the Great Northern Railway, recognising the danger of the level crossing, has adopted a system of continuous bell ringing on the Hatfield and Luton branch of their line, so that at the two level crossings on that section approaching drivers or pedestrians have ample warning of oncoming trains. This is particularly important where there are sharp turns in the neighbouring roadways, or where high hedges obstruct the view ahead.

Roads in Lincolnshire.

IN many respects the speech of Mr. Embleton Fox at the dinner of the Motor Union at Lincoln on Saturday was the most noteworthy utterance during the whole gathering. He spoke as a chairman of Quarter Sessions who had never had to fine a member of the Union for exceeding the speed limit, and there was a sense of glowing pride as he declared, "You also see before you the chairman of a County Council who has been from the first convinced of the futility of a speed limit." Such an introduction gave him a pleasant reception at the hands of the assembled motorists, and those

from the south could not fail to contrast the varying views that prevail in different parts of the country. Mr. Fox went on to speak of the excellence of the roads of the county. In Lindsey, he said, they claimed great credit for having anticipated the advent of the motor-car in regard to the roads, and they were endeavouring, consistently with their duty to the ratepayers, to improve the roads with a view to motor traffic. He did not say that tar macadam would be the panacea for the dust nuisance, but he thought it fairly held the field at the present moment, and the County Council was doing a good deal in that respect. And on this point most of the visitors had conclusive proof.

Road Experiments.

THIS week the long-anticipated tar-spreading tests, organised by the Roads Improvement Association on behalf of the R.A.C. and the Motor Union, are being held on the Hounslow and Staines road. The trial of tar-spreading machines is also taking place, these being tested on the same

discover an apparatus that will economically spread a suitable preparation of tar so that it may penetrate deeply into the road and bind the materials instead of forming a separate coating on the surface. There are about 20,000 miles of main road in England and Wales alone, and the successful competitors have a wide constituency for future work.

The Tourist Trophy.

NEXT week the Tourist Trophy races will take place in the Isle of Man, and it is unfortunate that the practising should have been characterised by a larger number of mishaps than has taken place on previous occasions. On Wednesday a West car ran into Sulby Bridge and was seriously damaged, while an accident occurred to a Thornycroft on Snaefell. Another accident was also reported from Ramsey. There is really nothing fresh to add concerning the events, except to say that with racing on Tuesday, Thursday, and Friday, those who venture across to Douglas from the mainland will have a busy time. All the best steamers will be run by the companies daily

The Motor Union Meet at Lincoln.—On the Way to Canwick Hall.

road, between Baber Bridge and the Staines boundary, as well as on the flint road between Twickenham and Kempton Park and the gravel road between Virginia Water and Reading at Ascot. The trial on the latter highway, which is under the control of the Berkshire County Council, will take place on the morning of Friday, the 24th, following which the Berkshire Automobile Club is entertaining the judges' committee and various representatives of official bodies to lunch. The rules governing the competition have previously been given in the *M.C.J.*, and it is satisfactory to know that eight tar-spreading machines and nine preparations of tar have been entered. Most of the latter have already been used on busy roads in various parts of the country, so that the competition is one of a thoroughly practical nature, and the Roads Improvement Association are sanguine as to the good results that will follow their enterprise. Tarring the roads has so far proved its value as a palliative for laying dust, but the fact that it has generally been applied by hand has made it too expensive for many local bodies. It is hoped to

from Liverpool at 10.30 a.m. and 2.45 p.m., commencing on Monday next. The charge for the conveyance of cars from Liverpool to Douglas, or *vice versa*, is 40s. per car.

THE Handbook and Guide of the C.T.C. for 1907 is to hand, with the usual well-known features, together with miscellaneous information for the guidance of motorists and a table of railway rates for motor-cycles. The list of hotels in England, Scotland, Wales and Ireland will be of service to motorists on tour.

THE British and Colonial Daimler-Mercedes Syndicate, Ltd., whose headquarters are at 532, Oxford Street, London, W., are putting on the market a new all-British car, which is to be known as the Daimler-Mercedes. The vehicles, which are being built under licence from the Daimler Motoren Gesellschaft, the makers of the Mercedes cars, are being constructed by the Yorkshire Engine Company, of Sheffield. For the current year only two models are being turned out, viz., 30-h.p. four-cylinder and 45-h.p. six-cylinder, the bore and stroke of the engines of both being 110 mm. by 130 mm.

FLEXIBILITY.

WHAT IT MEANS AND HOW IT IS OBTAINED.

(Concluded from page 247.)

WITH a motor of given horse-power, the energy required to accelerate to a given extent the flywheel, which must be used, will be inversely as the number of cylinders. Thus a single-cylinder engine will be drawn upon for energy so largely by the flywheel that the acceleration imparted to the car in a unit of time will be greatly reduced. With a twelve-cylinder motor, for instance, which can be operated, if desired, with no flywheel at all, there will be no large call for energy to be stored in the rotary form, and it will practically all go toward the acceleration of the car. Engines having numbers of cylinders lying between these two extremes are capable of more rapid accelerations, other things being equal, as the number of cylinders is greater.

The high degrees of flexibility possessed by motors having many cylinders and their quality of rapid acceleration are explained customarily by saying that the explosions come very

"picking up" power which the single-cylinder car would possess as compared with the four.

In point of fact the fly-wheel of a single-cylinder engine, while much heavier per horse power than that of a four-cylinder, is kept down in weight from practical considerations at the sacrifice of steady running, while those of the multiple-cylinder engine, which may be comparatively light, are made liberally heavy in each instance to secure a high degree of steadiness of operation.

There is thus less difference between the flywheel weights per horse power in engines of one to six cylinders than would be supposed, but still a large variation in favour of the multi-cylinder types.

The engine of few cylinders which has to have stored at all times in its flywheel enough energy to carry it over several idle strokes, one of which may be a compression, and at the same time keep its vehicle running, will always make large demands upon each explosion for the replenishment of this store of energy, and will be able to impart for accelerative purposes to its car a comparatively small amount of energy per unit of time

The Motor Union Meet at Lincoln.—A Snapshot at the Gymkhana. (See page 267.)

close together, or even overlap, and the energy given out by the engine becomes more nearly or quite continuous, there being no time allowed for the car to slow down between power impulses. This explanation covers the ground fairly well. The fact is that, as the cylinders are increased in number, so that there are few or no complete idle strokes, the flywheel capacity may be greatly reduced, as there are no considerable periods in the cycle when no energy is being developed, and during which not only must the speed of the engine but that of the vehicle be kept up by energy withdrawn from the flywheel, after being stored in the wheel during preceding power strokes. The size of flywheel, which must be used on any engine, is that which will secure a fairly smooth action of its motor at full throttle, when slowed down to a couple of hundred revolutions per minute or so, with a single-cylinder motor of a certain horse-power. To secure as great a degree of steadiness of running as that obtained with a four-cylinder engine of the same power would require a wheel of more than a dozen times the capacity of that necessitated with four cylinders. This, of course, is out of the question, and cannot be carried out in practice, but if it were it is easy to see the enormous call which the flywheel of the single engine would make upon the motor during acceleration, and the relatively low

and hence will be less flexible in point of rapid bursts of speed than other types.

Finally, it may be said that in order to secure the utmost of what is known as flexibility, the following conditions, and probably some others, are desirable. A motor freely drawing a perfectly proportioned mixture through a well-adapted throttling device; well timed and liberally proportioned valves, and the greatest practicable subdivision of the explosive impulses, that is, the largest practicable number of cylinders, and, finally, a short stroke and a high rotative speed. The inevitable increase of flywheel weight and capacity with every attempt to concentrate the power production in a lesser number of cylinders acts, it must be remembered, in a beneficial way, as well as in the adverse manner as regards flexibility already spoken of. The larger the fly-wheel storage of energy, the larger is the reserve available to be drawn upon to help a car over sudden short resistances. The fly-wheel is always a steadying influence, and is thus by nature a deterrent to changes of speed—either acceleration or deceleration.

THE Edinburgh Fire Brigade is about to adopt a petrol fire engine, of a pumping capacity of 500 gallons per minute.

THE MOTOR UNION AT LINCOLN.

NO man's education is completed in the schools. In fact, it can really be said not to have begun till he forgets some of the ordinary lessons of his early years. According to most geographical primers the whole of Lincolnshire is flat—a great expanse of dreary fenland, with never an elevated mound, and nothing to compare even with the hills of such a county as Essex. But, after taking part in the gatherings which comprised the May meeting of the Motor Union, this belief of youth is entirely dispelled, and the great organisation of motorists, of which Mr. Rees Jeffreys is the resourceful secretary,

invitations to county magnates to have rides in cars—for educational purposes.

The meet at Lincoln last Saturday followed the orthodox lines, and, thanks to the forethought of Mr. Godfrey Low, the hon. secretary of the Lincolnshire A.C. (which now numbers over 200 members), a distinct success was achieved. The municipal welcome was cordial, for the mayor (Col. J. S. Ruston, J.P., P.L.) is both a city father and an enthusiastic motorist, while the sheriff, Dr. Mansell Sympson, J.P., combines civic virtues with motoring interest and literary ability. Both these gentlemen were in their robes of office when they received the General Committee of the Motor Union in the Guildhall over the Stonebow—a handsome fifteenth-century gateway that is the hub of the city, from which everything seems to radiate. Colonel Ruston was able to point to the record of Lincoln—with regard to its friendly attitude towards motorists—as an assurance of that toleration which welcomes any harbinger of progress. He told us that throughout the wide county of Lincolnshire there was none of the harsh treatment of motorists that was noticeable in some places, and that both the Chief Constable of the city and of the county viewed

The Motor Union Meet at Lincoln.—The Visitors' Cars in the Great Northern Railway Company's Yard.

must be regarded as a peripatetic missionary of England—to the English. Three times a year it is bringing motorists from all parts to the central cities, where archaeological lore, social delights, municipal recognition, and that spirit of camaraderie that has done so much for the advancement of Motorism are cultivated in exercises which have the further advantage of educating the people and luring from the stable to the garage those whose pockets are sufficiently lined to leave them a margin for upkeep after purchasing a car.

A provincial meet of the Motor Union is really a revival of the old three volume novel—each book having some kind of sequence with the others. As a rule the first was necessary to an understanding of the successor. So it is with the tripartite nature of these Motor Union meets. Arranged in order of precedence they are—

1. Business meeting.
2. Gymkhana.
3. Dinner and speeches.

As the day wears on serious matters recede, and, beginning with the consideration of the dubious methods of local authorities, the affair generally ends with banter of chief constables and

Motorism in a sympathetic spirit, the latter inviting the A.C. to co-operate with him in securing consideration for all users of the road. Reply was voiced by Mr. C. D. Rose, M.P., who then proceeded to occupy the chair for the committee meeting of the Motor Union.

Several important matters were considered by the committee, which resolved to increase its subscription to the expenses of the tar-spreading competitions to £400; to remit the question of enforcement of the speed limit in certain districts to a sub-committee for further consideration; to make grants towards legal expenses in special cases, and to continue negotiations with the railway company with a view to the improvement of the ferry accommodation between New Holland and Hull for motor-cars. The secretary reported that 1,200 motor-car badges had been issued, that fifty-nine applications for advice had been dealt with during the past month, that seven more clubs had affiliated, and 200 motorists had joined the Union direct, raising the number of members to over 15,000. It was also agreed to present medals for competition to the Wolves hampton, Sheffield, Sussex, Kent, and the Naval Automobile Club.

Unfortunately the weather was not so warm in its welcome

as the civic rulers, nor so hearty in its greeting as the ecclesiastical authorities. While the committee of the Motor Union was deliberating in the room over the Stonebow, Canon Hicks and the Rev. F. Kay were conducting a party of motorists over the cathedral. They did not omit to point out the swineherd on the north-west tower, who stands blowing his horn quite oblivious of the traffic below. Mr. Kay was a delightful guide to the nobly proportioned nave, and learnedly told how comprehensive is the great fan of all the styles of architecture from the days of Remigius. But outside the cathedral the wind was high and lusty, and when motorists went forth canopies were raised and windproof garments donned in preparation for the unfriendly weather which seemed in store.

Luckily there was a brighter outlook as the cars assembled in the Great Northern Railway Company's yard—a spacious ground kindly placed at the disposal of the organisers by the railway company, which has done much for the city, and affords travellers the best route for reaching Lincoln either from north or south. Nearly a hundred cars were assembled, and it was a gallant procession that set forth for a circuit of the city. Led by the mayor, it was soon sent on its way. We were on a 30-h.p. Daimler, driven by Mr. J. Huskinson, the manager of the

Nottingham depôt—a combination that secured a pleasant run along the sinuous route, with its varying gradients and frequent halts and starts, not one of which interfered with the perfect delight (the weather, of course, being always excepted) of the run. Passing two churches with Saxon towers, we made way to the Stonebow, to the left of which the police directed the drivers, from whence we went to Yarborough Road, where we had a fine view of the extensive preparations for the Royal Show, of which all Lincoln is talking. Just touching the Ermine Street, which runs in a straight line to the Humber, the route was under the Newport Arch of Agricola, and then through the Exchequer Gate Arch to the grand West Front of the Cathedral. Round this we skirted by the statue of Tennyson and the Pottergate Arch, from whence was a glimpse of the valley of the Witham, to Canwick Hall—for which we had been prepared by the capital itinerary given by the Sheriff. So far the way had been upward and we were on a hill with the city of Lincoln smoking in the hollow below. Thence the road was a descent to tramlines and—quite a touch of mediævalism—a level crossing across the High Street. By way of demonstration a train was driven through, while motor-cars, tramcars, and a crowd of miscellaneous traffic was stopped—such a halt as

the people of Lincoln have to suffer every day, and many times during the day. Once beyond the crossing the way lay along a fine wide thoroughfare, and then up Canwick Hill to Canwick Hall, the hospitable home of the Sibthorps.

There Lady Cholmeley received the visitors in the absence of Mr. and Mrs. Waldo Sibthorp, and then an interesting gymkhana was held in the cricket ground. The cars were well arranged round the enclosure, the arrangements made by Mr. S. Oglesby being excellent. Judging was undertaken by Mr. C. D. Rose, M.P., Earl Russell, Mr. Charles Hardy, and Mr. Rees Jeffreys. The marshals were Major Cole, Captain Newsum, Messrs. W. A. Tomlinson, W. J. Newsum, C. Nelson, and Godfrey Lowe. Mr. W. R. Pennell was starter. There were three events. In the starting and stopping race Mr. H. Moyses, of London, was first, and Dr. Husband, of Crowland, second. Musical chairs, as usual, formed an attractive item on the programme, Mrs. Russell Matthews, London, and Miss Gamble, Lincoln, being adjudged equal. The "tying the knot" race was provocative of mirth, and was run in three heats, the final resulting in the win of Major and Mrs. R. S. Ruston, Shrewsbury, and Mr. and Mrs. S. W. Philpott, London. Then followed tea and the prize distribution, the drive back into Lincoln city being a "go-as-you-please" kind of adventure.

In the evening the proceedings were concluded by a dinner in the County Assembly Rooms, at which Sir Hickman Bacon, Bart., presided, supported by Earl Russell, Hon. A. Stanley, M.P., the Mayor and the Sheriff of Lincoln, Major J. A. Cole, Captain Mitchell Innes, Captain Deasy, Messrs. C. D. Rose, M.P., W. Embleton Fox, C. H. Roberts, M.P., Ballin Hinde, G. T. Langridge, Rees Jeffreys, W. E. Rowcliffe, Hopkins Walter, C. Hardy, C. H. Dodds, A. McAlpin, T. B. Cawood, T. C. Aveling, and other well-known motorists.

After the loyal toasts Sir Hickman Bacon testified to the value of the Motor Union and the excellent work being done by the organisation of motorists into a central body. Mr. C. D. Rose responded to the toast of the Motor Union, and congratulated the local club on its activity. A humorous speech was made by the Hon. A. Stanley in proposing "The County and City of Lincoln," to the first portion of which the chairman of the Lindsey County Council, Mr. W. Embleton Fox, responded, declaring his views as to the futility of the speed limit, and the endeavours of his Council to improve the roads for motor traffic. The Mayor and Parliamentary representative also replied, and speechmaking was brought to a conclusion by Earl Russell and Major Cole.

Thus ended the first of the Motor Union's provincial meets for 1907—a thorough success, towards which the efforts of the Lincolnshire A.C. adequately contributed.

FOR throwing stones at Mr. R. P. Houston, M.P., when in his motor-car along the Finchley Road, N.W., two men have been fined £1 each and costs.

THE village of Buckden has a couple of hotels, and the story of how certain motorists commenced their lunch in one and finished at the other was told at the dinner table at Lincoln in the evening. Evidently police traps are not the only terrors of that village.

OUR illustrations of the Newport Arch and the Cathedral are from the Guide to Lincoln, by Dr. E. Mansel Simpson, J.P., Sheriff of Lincoln. This is the standard work on the history and antiquities of the city, and we are indebted to the publishers, Messrs. Methuen and Co., for permission to reproduce these interesting sketches which accompany our report of the Motor Union meet.

THE Southern Motor Club contingent included Messrs. Allen Vickers, H. Luff-Smith, W. L. Lorking, and S. W. Philpott, the latter having run through from town without tyre troubles—thanks to the Elastes with which they were filled. Very different was the experience of the Hon. Arthur Stanley, whose tyre burst nearly thirty miles from Lincoln—a condition of things which was pointed out to him by every policeman he subsequently met.

CONTINENTAL NOTES.

The Darracq Company and their Racing Cars.

It will be remembered that the Darracq Company last week announced that their cars had been withdrawn from all racing events by reason of their driver, Wagner, having agreed to drive a Fiat. We learn, however, that the Darracq cars still promise to figure prominently in the events of 1907, for, within a short space of time after the firm offered the vehicles for sale, together with a right to run in the event for which they had been entered, the offer was accepted by some very keen and well-known sportsmen, including the wealthy amateur driver Count Florio, who has purchased two of the Darracq flyers, one of which he will drive in the Kaiser's Prize Race, while an amateur friend of the Count will take charge of the other. Herr Branda, another well-known Continental sportsman, has purchased a third car, and will also be seen at the wheel driving a Darracq in the same event.

The New Panhard Racing Cars.

We give an illustration herewith of one of the three racing

Prix of the Automobile Club of Belgium, this last-named even having the same regulations as those adopted for the Kaiser Prize race, it having been decided to run the Circuit des Ardennes contest under the old conditions. If it is found impossible to obtain the necessary permission for a three days' meeting, the second and third events are to be run off on the second day of the meeting.

The Paris-Ostend Motor-cycle Reliability Trial.

The Auto-cycle Club of France has definitely decided to hold its Reliability Trials of motor-cycles from the 20th to the 23rd June. The competitors will be divided into five categories, viz.:—1, Motor-bicycles of a cylinder capacity of one-third of a litre; 2, motor-bicycles quarter of litre cylinder capacity; 3, tri-cars half litre cylinder capacity; 4, voiturettes with single-cylinder engines up to 90 mm. bore; and 5, voiturettes up to 100 mm. bore. On the first day the run will be from Paris to Boulogne (270 kilometres); on the second, Boulogne to Ostend (117 kilometres), where a speed trial will be held; on the third, from Ostend to Rouen (273 kilometres); and on the fourth, from Boulogne to Paris (135 kilometres).

M. Dutemple on one of the new Panhard Racers for the A.C.F. Grand Prix.

As will be seen, the Panhard Company have followed the Renault practice in building the radiator in front of the dashboard. The curious shape of the fore part of the bonnet will also be noticed.

cars Messrs. Panhard and Levassor have built for the A.C.F. Grand Prix race. The vehicles, which will be driven by Messrs. Le Blon, Heath, and Dutemple, are fitted with an engine comprising four separate cylinders, 185 mm. bore by 170 mm. stroke, the normal rating being 125-h.p. As will be seen, the radiator is located at the rear instead of the front of the motor, and practically forms the dashboard. Attention may also be drawn to the curiously-shaped wind-cutting bonnet. The ignition is by Eisemann high-tension magneto, and the carburettor a Krebs with hydraulically-controlled automatic air inlet. The clutch is of the Hele-Shaw multiple disc type, and the change-speed gear gives four speeds forward and a reverse, the final drive being by a cardan shaft and bevel gear to a rear live axle.

The Ardennes Meeting.

On account of the former dates coinciding with the fair at Neufchateau, the Automobile Club of Belgium has altered the date of the Ardennes meeting, which will begin on July 25th with the Circuit des Ardennes race. On the following day there will be the race for the Liedekerke Cup, and on the 27th the Grand

The Fatal Accident to M. Albert Clement.

Parisian motoring circles met with a rude shock on Friday last week when the news came to hand that M. Albert Clement, the son of M. Clement, the manufacturer of the Clement-Bayard cars, had met with a fatal accident when practising on the Seine-Inferieure circuit, on which the race for the A.C.F. Grand Prix is to take place in July next. Friday was the last day on which practising with racing cars was allowed by the authorities, and young Clement had obtained a few days' leave from his military service, in order to put one of the three Clement-Bayard racers entered for the forthcoming event through its paces on the actual course. He was accompanied by M. Gaudermann, who was also to drive a similar car in the Grand Prix. All went well until a sharp curve at Saint Martin-en-Campagne, a little village about 13 kilometres from Dieppe, was reached. For some reason or other the deceased failed to take the corner successfully, for, running wide, he grazed some houses, and ere he could get the car back on to the road it ran into a heap of sand, which caused it to leap and get entirely out of control, the vehicle practically smashing itself to bits ere it came to a

stop. Gaudermann, who was early pitched out, got off with slight injuries, but young Clement, who was pinned in the vehicle by the steering wheel and pillar, was so seriously injured about the neck that he succumbed within a few minutes. Gabriel and Rougier, who were also practising on a De Dietrich, were practically the first to arrive on the scene, and although they procured medical assistance without delay it was of no avail.

The remains of the Racing Car on which M. A. Clement lost his life.

The deceased was an expert driver, and although only twenty-three years of age had taken part in a number of long-distance races. The funeral took place in Paris on Sunday last, all the well-known members of the French motor industry being present.

Belgian Motor-Car Imports and Exports.

So far this year there has been a slight decline in the importation of foreign motor-cars and parts into Belgium, the returns for the four months ending with April showing a total of only £51,299 as compared with £53,907 in the first four months of 1906. On the other hand, the exports of motor-cars and parts from Belgium during the same period show an increase from £116,902 to £117,074.

Miscellaneous Items.

The Royal Automobile Club of Portugal is considering the question of organising a race from Madrid to Lisbon during the 1908 season.—It is reported that Henri Fournier, who won the Paris-Berlin race on a Mors car, and who has not participated in speed contests for some years, will drive an Itala machine in the forthcoming Kaiser's prize race.—Under the title Le Syndicat des Fabricants D'Antiderapants de France, an association of manufacturers of non-skids has just been formed in Paris.—A motor-car exhibition was opened in Zurich on the 16th inst.—So far, no less than 192 entries have been received for the Herkomer Touring Trophy Competition.—The annual hill-climbing competition at Chateau Thierry is to be held on the 15th of September next, while that at Gaillon is fixed for the 20th October.—It has been officially decided that the competitors in the Commission Sportive Cup race, which is to be run at the same time as the Grand Prix, shall make six rounds of the Seine-Inferieure circuit, thus covering a total distance of about 462 kilometres.—In view of the growing number of cars in the Kaiser's garage, His Majesty has just created a new post, he having appointed Lieutenant Zeysz as Marshal of the Imperial Motor Stud.—The Automobile Club Bourguignon is organising a hill-climbing competition at Val-Suzon, near Dijon, for the 2nd June.—The third international motor-car and cycle exhibition at Milan was opened on Saturday last. Among the English cars exhibited are the Daimler, Siddeley, and Napier.

THE O.S. ODOSPEEDOMETER.

SCARCELY a week passes without its lesson to the motorist to equip his car with a speedometer as a necessary apparatus with which to controvert evidence of the police on occasion. On the principle of the supply following the demand, several devices have been brought out, and among these were three or four notable types shown at the recent Cordingley Show. We would specially refer to that shown by Mr. Searle, 33, Glasshouse Street, Regent Street, London, W., whose instrument won the first prize at the A.C.F.'s trials.

In this type a new form of drive is introduced, so that the power is taken from the countershaft instead of the road wheel. An aluminium pulley wheel is employed to transmit the power by a flexible steel cord to another pulley wheel, which is attached to the end of a flexible shaft which drives the indicator. The first pulley wheel being split can be readily attached to the sprocket shaft or the cardan shaft, so that the drive can be well protected from damp and mud. The steel cord is practically an endless one, ensuring a certain drive that is not likely to slip.

The indicator is of the magnetic type. Within the casing is a magnetic horseshoe upon a vertical spindle with its poles projecting upwards. This is coupled to the flexible shaft already referred to, so that it is directly driven by it. Immediately above the magnet is a copper disc on a spindle resting in jewelled bearings; at the other end of the spindle is a pointer working over the face of the instrument. A thin iron plate is imposed between the disc and the dial to form an armature.

The rotation of the magnet induces in the copper disc currents of electricity which cause the disc to try and revolve in unison with the magnet itself. Owing to the provision of a fine hair-spring, however, continuous rotation of the copper disc is impossible, for after it has been deflected but a little distance from its zero position, the torsion of the spring balances the torque of the magnetism, and the disc in consequence remains in equilibrium, with its pointer indicating the speed at which the car is travelling.

The device is so extremely simple in its parts that derangement is hardly likely to take place, and so accurate is the adjustment that the indicator may be relied upon to work well under any conditions. In addition to the acknowledged accuracy of the instrument, is the merit of neatness and economy of cost. The indicator is made to register 10,000 miles, as well as to show the rate of speed, and is of high-grade workmanship as well as of good design. It is also fitted with a trip recorder of the usual type.

THE BEXHILL MEET.

BEXHILL has been a busy scene this Whitsuntide, thanks to the enterprise of the Crystal Palace Automobile Club, which organised a series of automobile races on the well-known track at that favourite resort. All day on Sunday motorists were arriving from various parts of the country, and it is estimated that nearly 500 motor-cars were housed in the town on Sunday night, while others came along before the racing on Monday morning.

The secretary of the meeting was Mr. Henry Hollands, with Mr. A. V. Ebbelwhite as starter, the latter gentleman and Mr. F. Straight being the handicappers. Earl de la Warr, Messrs. F. W. Baily, S. F. Edge, and E. J. Pape were clerks of the course, which was lined with thousands of people, whose interest in the racing was keen until they grew tired of the long waits between the events, and disappeared to find their amusement elsewhere. Fortunately for their pleasure the threatening weather improved during the day, so that they had not so much complaint to make on that account.

after the long process of elimination had taken place the final was as follows:—

Car.	Driver.
1.—60-h.p. Napier	S. Smith.
2.—60-h.p. Napier	C. Edge.
3.—30-h.p. Star	F. R. Goodwin.

The scratch race for touring cars of a chassis price of more than £700 brought a field of four Napiers and two Isotta-Fraschinis, and in the end Mr. S. F. Edge's Napier defeated that driven by Mr. H. C. Tryon.

The fifth event was limited to cars with engines and chassis of the dimensions similar to the Kaiserpreis competition, and was run in two heats with a run over for Mr. Cecil Edge. In the end the order was:—

Car.	Driver.
1.—60-h.p. Napier	C. Edge.
2.—40-h.p. Junior	Capt. Owen.
3.—30-35-h.p. Simms-Welbeck ...	G. H. Woods.

During the day Mr. S. F. Edge made an attempt on the previous Bexhill record, and actually attained a speed of 63.38 miles per hour one way and 73.77 miles per hour down the

The Bexhill Race Meeting.—A Runaway Heat.

The proceedings commenced with an appearance competition, in which Mrs. A. E. Cohen won the ladies' section with a 16-20-h.p. Chenard-Walcker, and Mr. T. H. Nash the gentlemen's section with a Unic.

The serious business of the day began with the handicap for touring motor-cycles, which attracted fifteen entrants, the winners being H. A. Collier (3½-h.p. Matchless), R. M. Brice (3½-h.p. Brown), W. H. Wells (5-h.p. Vindec Special).

The handicap for cars whose cylinders $\frac{D \times N}{25}$ are under sixty-five was run in eight heats, which left two 9-h.p. Sizaire-Naudins, two 12-h.p. De Dions, one 10-h.p. Adams-Hewitt, one 9-10-h.p. Cadillac, 15-h.p. De Dion, and one 14-h.p. Vulcan for the second round. In the end the result was:—

Car.	Driver.
1.—10-h.p. Adams-Hewitt	R. R. Smith.
2.—14-h.p. Vulcan	L. Russell.

The next event on the programme was the competition for the Earl de la Warr's cup, to be awarded to the car which won two out of the three following competitions:—Quarter-mile, flying start; 110 yards slow speed on top gear; half-mile-standing start, on top gear. This brought twenty-seven entries, and

hill. But, altogether, the impression of the first day's meeting was not a pleasant one, protests being almost as frequent as races, and the arrangements for informing the spectators and competitors of the order of things not quite so good as might have been expected.

Complaints on Monday, followed by a night of calm, did much to restore the equanimity of public and competitors alike, so that on Tuesday a great improvement was noticeable. Everything seemed to be awakened and throbbing with a new zest. Smart starts and close finishes delighted the crowd that again lined the track and enabled the meeting to be brought to a satisfactory conclusion.

An appearance competition opened the programme, Miss Dorothy Levitt winning the prize in the ladies' section, and Mr. S. F. Edge on a two-seated Napier being first in the gentlemen's, with Mr. R. Gatti on a 40-h.p. Itala second.

The motor-cycle race was won by Mr. H. A. Collier on a 6-h.p. Matchless, Mr. R. M. Brice being second on a 5½-h.p. Brown.

For the cup given by Mr. E. J. Pape, of Moor Hall, Ninfield, Sussex, there were twenty-three entrants, the handicap

starts being allotted on the basis that will serve in the speed trial in connection with the Herkomer Trophy. In this event two Spyker cars got into the final, the result of which was as follows:—

Car.	Driver.
1.—15-20-h.p. Spyker	Hautekeet.
2.—30-40-h.p. Spyker	Van Hassalt.

In the scratch race for touring cars of a chassis price of £700 and under, there were fifteen entrants and the final result was:—

Car.	Driver.
1.—40-h.p. Napier	F. G. Cundy.
2.—40-h.p. Junior	Capt. W. E. Owen.

The race for cars of a chassis price of over £700 brought out the same field as the corresponding contest of the previous day, and produced the following result:—

Car.	Driver.
1.—80-h.p. Napier	C. Edge.
2.—40-h.p. Napier	S. Smith.

At the end of the events Mr. S. F. Edge made an attempt on the record secured by him on the previous day, but only attained a speed of 72.58 miles per hour, against the earlier effort of 73.77 miles per hour.

Apart from the performances of the cars, interest attached to the good behaviour of the Dunlop tyres, which were fitted to all the winning vehicles.

LINCOLN ECHOES.

MESSRS. GILBERT AND SON, LTD., are the Lincoln agents for the Siddeley car, and their works are well equipped with a staff thoroughly understanding repair work.

CANON HICKS, who conducted a party of motorists over the cathedral, is a motorist, the owner of a Humber car, which he uses in travelling to preach in the various churches of the diocese of Lincoln.

MR. H. MOYSES, who is in charge of the new Thornycroft showroom in Albemarle Street, Piccadilly, W., drove through to Lincoln on Friday, returning on Sunday to town, and continuing his journey to Bexhill.

ALTHOUGH Mr. C. H. Roberts, M.P. for Lincoln, explained that he is not a motorist, he has many motoring relatives, notably the Hon. Geoffrey Howard, M.P., whose enthusiasm for the car is well known in the Lake district.

MANY of the cars visiting Lincoln last week were put up at the splendid garage of Messrs. R. M. Wright and Co., near the G.P.O. Mr. Wright has many important agencies for new, as well as facilities for the repair of old vehicles.

AMONG the garages met with on the Great North Road by those who journeyed to Lincoln from London was that of Messrs. Murtith Bros., of Huntingdon, who add to a well-equipped establishment a real knowledge of the motor-car.

ELEVEN motor-cyclists of Lincoln started from the city on Monday morning in the 100 miles reliability trial organised by the Lincolnshire Motor Cycle Club. Other members of the Club started simultaneously from Sleaford, Boston and Louth.

DURING the night of Friday Mr. H. Luff-Smith, of the Wolseley Company, played the part of the good Samaritan to many of the motor-cyclists engaged in the London to Edinburgh run. The perils of the road were many, and punctures were somewhat numerous. From his Siddeley car he was able to assist a number with petrol—and advice.

AT their works in the Station Road, Bexhill, Messrs. L. A. Russell and Co. have a full stock of accessories, petrol, &c., as well as a well-equipped charging plant for accumulators. Their repair plant is well up to date, and altogether the firm are in a position to cater for the wants of every car owner who may be in difficulties.

A SIX-JET CARBURETTOR.

A SOMEWHAT novel form of carburettor for petrol motors has recently been put on the market by an American concern, the Willet Carburettor Co., of 764, Ellicott Square, Buffalo, U.S.A. A feature of the arrangement is that instead of the petrol being sprayed through a single nozzle it passes out of a set of six, only two of which, marked F, are seen in the sectional view given herewith. The six nozzles all draw their supply of spirit through the pipe F¹ from the float chamber C. Each nozzle F projects through a small circular opening G in a cross partition of the mixing chamber. At low motor speeds air entering through the side opening B rises through the holes G past the nozzles and sucks up the requisite quantity of spirit. When the engine is running fast an inverted V-shaped auxiliary air valve E is brought into action, it being lifted against the tension of its spring E¹ by the increased suction of the motor. When it lifts the air takes the course past its sides indicated by arrows K, which current is directed by the slope of the sides of the valve E towards the top of the six spraying nozzles, thus mixing with the petrol from the latter and the air rising through the openings surrounding them. By means of a thumb nut W at the carburettor top any degree of tension can be put upon the spring E¹. The passage of mixture to the motor is under the control of the

revolving barrel throttle K¹, which controls the exit passage A through attachment with the arm K. The float in the chamber C is made of cork, and is held in position on its central spindle by means of a small spring-retained clip, so that by removing the cover it is an easy task to raise or lower the float. The inlet of spirit is under control of a ball valve in the bottom of the float chamber, and beneath the valve is a screw-retained cleaning plug M. A drain cock is fitted at D, while provision is made for adjusting the outlet from the pipe F¹ to the nozzles by means of an adjustable needle valve. Among the advantages claimed for the new device is its ability to give good results with the lower grades of petrol, owing to the intimate mixing of the spirit and air, and also that it enables the engine to run at an extremely low speed.

THE American Society of Automobile Engineers in its constitution defines the word "automobile" as follows:—"The term 'automobile' as used by this society is intended to cover any self-propelled vehicle operating on or under the surface of the earth, or water, or in the air." This covers motor-cars, motor-boats and airships.

THE extensions to the Falcon Motor Works, Falcon Road, Guildford, will add considerably to the facilities possessed by Mr. E. A. Humphreys for the storage of cars, the repair of vehicles, and the stocking of spare parts, &c. The premises are situated just off the main London and Portsmouth road near the London Road Station at the entry to the town.

THE LOCATION OF CONTACT MAKERS.

UNTIL a year or so ago the contact makers of petrol motors were almost invariably located on the front end of one of the cam shafts. If the engine was the only thing to be considered this arrangement would be ideal, as it represents the simplest and least expensive construction. However, in a motor-car the best design of every part depends to a great extent upon its relation to the adjacent mechanism. The contact maker is no exception to this rule, and besides its connection to the engine its accessibility as well as the directness of

The 25-30-h.p. Straker-Squire C.S.B. Car which is taking part in the Irish Reliability Trials.

The vehicle, which has seating capacity for five persons, is fitted with a four-cylinder engine, 110 mm. bore by 180 mm. stroke. The control of the motor is by means of a variable lift to the inlet valves, which, like the exhaust, are entirely enclosed. The car weighs 26 cwt., and has a wheelbase of 9 ft. 6 in.

the control connections and electrical connections have to be considered. With the device in front the rods for the ignition advance and retard control often pass through a considerable number of tight places, and in many instances several bell cranks are necessary. These complicated connections are unsightly, are apt to rattle and readily become loose, involving considerable play and uncertain timing. To obviate these difficulties some very neat designs of ball and socket and double hinge joints have been brought out.

A forward location of the contact maker with a multi-cylinder motor involves long wires whose front ends are considerably exposed to dampness when ordinary connections are used. As the radiator is usually close to the front end of the engine crank case, it is often a difficult matter to inspect a contact maker located in front. These are, remarks an American writer, some of the considerations which have induced designers to add somewhat to the complication of the motor in order to place the device more conveniently. There is a very strong tendency in recent designs to add a special vertical shaft, driven from the cam shaft by bevel or spiral gears. This shaft is sometimes placed in front and more frequently at the rear, but the preferred location is at the centre of the motor, between the cylinders, with the contact maker somewhat higher than the cylinder heads. When the motor has the valves located in the cylinder head, operated by a single cam shaft on top, another location of the contact maker becomes possible. In a recent design of this kind the cam shaft is extended to the rear and the ignition make and break device mounted on the end in such a way that it extends through to the dashboard. This gives very short wires and permits ready inspection. Control connections, however, are not so simple unless they are of the type in which the finger levers are under the steering wheel. Take it all in all, no rule can be laid down for the best location for contact makers; only a careful study of the requirements in each case can lead to good results, and this study will be well repaid by the increased satisfaction of the user.

HERE AND THERE.

MR. J. BOND has opened the Central Motor Garage, Cannock, Staffs.

PRINCE LEOPOLD OF BAVARIA has just placed an order for a 50-h.p. Züst car.

THE garage of Mr. R. F. Surplice, at Pangbourne, near Reading, has been considerably enlarged.

TWO motor-cars have been purchased by the West Riding (Yorkshire) County Council for the use of their road inspectors.

MESSRS. GIBSON AND INGE, of the North Berks Motor Garage Co., have opened premises in Abingdon-on-Thames as a motor garage.

"MOTOR massacres" is the heading under which the "Buxton Free Press" chronicles reports of accidents in which motor-cars are involved.

BEHIND the Queen's Hotel, at Dundee, is a well-appointed garage for thirty cars, owned by the Dundee Motor and Cycle Company, Ltd., of 128, Nethergate, Dundee.

LORD ALEXANDER THYNNE has placed an order for a 35-h.p. "Nottingham" model, and Sir A. B. Grierson one for a 28-h.p. "Milverton" model car, with the Daimler Motor Company, Ltd.

THE sandwichman has found a new form of attraction, and on Saturday visitors in London saw a dozen taximeter cabs employed for publicity purposes in connection with the Waldorf Theatre.

DURING the course of his visit to the shipbuilding yards on the Clyde last week end our Japanese Royal visitor, Prince Fushimi, and his suite inspected the large motor works of the Argyll Company at Alexandria.

It is reported from Paris that the increasing vogue of the motor-car is ruining the diamond trade. One diamond firm which recently failed are said to have ascribed their difficulties to the growing popularity of the automobile.

The above illustration shows a recent addition to the Birmingham Fire Brigade equipment with a latest-type heavy vehicle chassis, driven by a 30-h.p. Siddleley vertical four-cylinder motor.

The body provides seating accommodation for sixteen men, including the driver, and the vehicle when fully loaded can attain a speed of twenty miles an hour.

THE New Leader car which has been built for the Tourist Trophy race is of 10-12-h.p., the four-cylinder engine being 3½ in. bore by 3½ in. stroke. The change-speed gear is adapted to give three speeds forward and a reverse, with direct drive on top. The live axle has only the driving effort to withstand, the weight of the car being carried by the axle casing.

THE District Inspector of co. Wicklow is the possessor of a 12-h.p. Turner-Miesse car.

THE charges for weighing motor wagons adopted by the Belfast Harbour Board are as follows:—Not exceeding 5 tons, 3d.; from 5 tons to 10 tons, 6d.; above 10 tons, 1s. each.

THE Central Motor Works of Keighley have been removed to larger and more conveniently situated premises in Hanover Street, Keighley, where there is a large garage, and motor accessories are kept in stock.

Miss Muriel Hinde on the 24-h.p. Deasy Car she recently purchased, and on which she made a non-stop run from London to Edinburgh last week. The achievement is a notable one, as Miss Hinde is not a professional driver, but an enthusiastic sportswoman.

A SUCCESSFUL long distance run on top gear has been accomplished on a 14-16-h.p. Argyll on a journey from Alexandria to London. All hills *en route* were negotiated with ease, demonstrating the flexibility of a four-cylinder engine.

MESSRS. SMITH AND SON, of Doncaster, have completed the alterations to their carriage works, and have opened it as a fully-equipped garage with accommodation for over 100 cars. They are in a position to carry out all kinds of repairs and also supply petrol, oils, grease, &c.

DURING the first eleven days of September next a petroleum congress will be held in Bucharest, and in connection therewith an international exhibition of petroleum and petroleum derivatives and products is being organised. The Roumanian Government has invited all foreign Governments and petroleum distillers to participate in the event.

MR. C. H. COOPER, of Willcott Road, Acton Hill, had just returned from a short ride with a friend, whose house he entered for a few minutes, placing his 3-h.p. Triumph outside. On leaving he was surprised to find it had gone, and no trace of it has since been found. The incident suggests a growing knowledge of motoring as well as a warning to cyclists.

THE following extracts from a letter received by Mr. S. F. Edge from Mr. Wilfrid H. Dolphin, chief motor engineer to H.H. the Nizam of Hyderabad, are of interest:—"H.H. the Nizam's garage is, I think you will agree with me after you have read the list, one of, if not the finest in the world, exclusively owned by one person. I give you below the list of his cars:—Five 40-h.p. six-cylinder Napiers, one 55-h.p. four-cylinder Daimler, two 30-h.p. four-cylinder Brasiers, one 30-h.p. four-cylinder De Dietrich, one 30-h.p. four-cylinder Argyll, two 24-h.p. four-cylinder Fiats, four 20-h.p. four-cylinder Richard Brasiers, one 18-20-h.p. four-cylinder Hotchkiss, one 18-h.p. four-cylinder Napier, one 12-16-h.p. four-cylinder Fiat, and a luggage car is about to be added. I, myself, have the honour of driving His Highness on all occasions, but the others are all driven by native drivers, trained by myself. My staff consists of forty-two men, over twenty of whom are now first-class drivers."

MESSRS. DENNIS BROS., LTD., have just completed three motor char-a-bancs for the Llandudno Motor Garage Company.

MESSRS. W. COLE AND SONS, LTD., whose garage is at 235, Hammersmith Road, W., make a special feature of the hiring of motor-cars for pleasure parties and professional use. They have recently issued a scale of charges which is presented in a very pleasing form.

THE Hotchkiss six-cylinder car now undergoing trial under the observation of the Royal Automobile Club arrived in London on the evening of Thursday, last week, having accomplished about one-quarter of the distance contemplated without any mechanical troubles. No stay was made in London, the car having left on Friday for Holyhead, *via* Hereford, where a halt was made for the night. This week the run on Monday started and finished in Dublin, the vehicle then being handed over to the Irish Automobile Club for their trials, so that there was no opportunity for special adjustments.

THE Motor Union of Great Britain and Ireland have decided to make a financial grant towards the costs of Dr. Mercer, a Liverpool member, in resisting a claim for damages brought by the relatives of a cyclist who was fatally injured by Dr. Mercer's car in October last. The accident happened in the Warrington Road, Whiston, where the cyclist collided with the motor-car, as the result of which he sustained a fractured skull. At the coroner's inquest the jury returned a verdict of "Accidental death," and said that no blame attached to Dr. Mercer. Notwithstanding these findings a writ has now been issued against Dr. Mercer for damages, and the case will be heard at the Liverpool assizes in July.

WE illustrate herewith a neat little set for charging accumulators which has lately been put on the market by the Premier Accumulator Co., of Northampton, and which should prove of interest to garage owners and motorists who have difficulty in getting their batteries re-charged. As will be seen, the set consists of a small $\frac{1}{2}$ -h.p. petrol engine, coupled direct to a dynamo with a small switchboard, including ammeter, voltmeters, switch cut-out, &c., fixed on the top of the dynamo. The plant is self-contained and very portable, all being fixed on one bed-plate. The dynamo has an output of 25 amperes at 10 volts, so that it is capable of charging thirty-two 4-volt batteries of the 25 ampere-hour ignition size, arranged two in series and sixteen in parallel, or

other sizes in proportion. The Premier Co. inform us that the set has been running daily for the last eight weeks, and that it will run continuously for twelve hours without the engine getting hot, and without any attention whatever. Particular notice is drawn to the steadiness of operation of the plant, as when the engine is running on full load no variation in the voltmeter needle can be detected, and the difference in variation when full load is suddenly thrown off the engine is only 4 per cent.

CORRESPONDENCE

Letters to the Editor should be addressed to the offices,
27-33, Charing Cross Road, W.C.]

THE COST OF CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reference to the correspondence now going on in your columns on the comparative cost of a railway locomotive and an automobile chassis, I will not attempt to discuss the correctness or otherwise of the figures quoted, but, in justice to one of the most perfect pieces of machinery of the present day, I must beg to differ with the implied opinion of Mr. G. P. H. de Freville that the locomotive has neither the high-class workmanship nor materials found in a high-grade car. The modern locomotive is undoubtedly the most reliable piece of machinery working to-day, and the materials used upon it are the finest

understand what they are copying. In the course of long experience, in which we have tried practically every form of brake in common use and many which are not, we have observed that a slight divergence from a good design may result in failure, and that the production of a sound brake requires no little judgment and resource. Our advice to the amateur is to have confidence in the manufacturer and to consult him when in difficulties. He finds no advertisement from faults in his products and is only too anxious to set them right. It must be added that almost inevitably he finds that ignorance is the cause of evil, and misunderstanding the forbear of more abortive notions applied to motor-cars than we should care to state.—Yours truly,

TOM WILLIAMS.

TRIALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of 4th May I have read Mr. Perry's letter on the "Scottish Club Trials," and also the reply in the next issue signed "A. E. T." The point of Mr. Perry's letter is that the object of reliability trials is to decide the qualities of various makes of cars upon a handicap formula, the chief factor of which is, of course, the price. This "A. E. T." appears to have ignored. Mr. Perry, I gather, has a car

The Bexhill Race Meeting.—A View at the Starting Point.

obtainable, whilst the workmanship is the finest of its kind obtainable. The proof of all this is the fact that it is a wonderful occurrence for a serious breakage to occur on a locomotive. When one thinks of the terrible strain on the side rods alone of a locomotive running at high speeds—and on the Great Western at any rate the speeds are high—combined with the heavy loads, the up hill and down dale work for over four hours at a stretch without a stop, it seems to me a marvel that our locomotives stand the strain put on them in the magnificent way that they do.—Yours truly,

ALAN A. L. HICKMAN.

A SIMPLE HUB BRAKE AND HOW TO MAKE AND FIT IT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We should like to extend a friendly warning to those motorists who may have read the letter on the above subject in the last issue of the *M.C.J.* and contemplate altering their brakes. Brake design is essentially a matter so intimately connected with the rest of the car that to tamper with it is unwise unless backed by expert knowledge. Copyists should always bear in mind that copying is no good unless they

which could compete in Class 1 of the Scottish Trials, but because it is 15-h.p., and therefore a large engine, it is forbidden to compete with cars fitted with smaller engines, costing more than Mr. Perry's car. It is most unjust that a manufacturer who gives a really good car with 15-h.p. engine at a low price is forbidden to compete with other cars whose manufacturers give less horse-power, and the cars are higher in price.—Yours truly,

A. M.

CHARGING ACCUMULATORS WITH PRIMARY BATTERIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—"Anti-Magneto" has been well advised to select the Boron battery as a reliable means of charging his accumulators, and, should his experience of the same prove as satisfactory as my own, which I do not doubt, he will certainly have no cause to regret acting upon such advice. I have used a 6-cell battery constantly for the past four years for charging my 30 and 40 amp. hours accumulators, and have found them extremely simple to manipulate; no special or technical knowledge is necessary to use them to the best effect; they require practically no

attention while in use; they prove much more economical and certainly more satisfactory than main-charging, and, which is of most importance, are thoroughly reliable and efficient for the purpose of charging accumulators.—Yours truly,

H. BINGHAM.

TRAFFIC ON THE THAMES EMBANKMENT.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the letter of Mr. W. Hetherington on traffic regulation on the London Embankment, in a recent issue of the *M.C.J.*, I should advise this gentleman to treat the tramway traffic as a separate road; that is to say, as if it were a railway running by the side of the road. At any rate, this is how I should treat it, until some specific regulations were made to the contrary.—Yours truly,

ALAN A. L. HICKMAN.

A 'BUS DRIVER'S KNOWLEDGE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was riding on the top of a horse 'bus in Camden Town last week, seated near the driver. A motor-'bus was immediately in front of us and an explosion occurred in its silencer. The driver of my 'bus turned to me and said, "Is that one of its tyres busted?" I said, "No, 'buses do not have pneumatic tyres." Driver: "Ah! I do not know much about machinery, I ain't no botanist!"—Yours truly,

GOWER.

On the occasion of Sir Joseph Ward's visit to Dumbarton twelve Argyll Cars were used to convey the party to Arrochar. The above illustration depicts the vehicles in front of the Argyll works at Alexandria.

WATER CIRCULATION TROUBLES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have lately bought a second-hand 8-h.p. Darracq single-cylinder car, which runs well except for overheating. The water boils in less than half an hour; the tank is under the bonnet and the radiator in front; the water runs from the tank into the pump, then to the radiator and from there into the engine. Should this be so? I think the water should come from the tank into the radiator, then to the pump, and from there to the engine, to cause the water to circulate quickly. I should be very glad if you could answer this query for me.—Yours truly,

C. BOOKER.

[Both the system of circulation as at present arranged and the alternative circuit suggested by Mr. Booker are wrong. The best arrangement is:—From the bottom of the tank to the pump, from the pump into the bottom of the water jacket, then from top of cylinder to top of radiator, and thence back to top of tank. By doing as we suggest the hot water will go straight to the radiator, and the pump will draw the coldest water in the circuit to deliver to the cylinder. As the car is a second-hand one, we advise the examination of the pump itself, the cleansing out of the radiator with a strong hot solution of caustic potash, and a careful scrutiny of the pipes for "kinks" or dents. We also are strongly in favour of the installation of a manometer on the dashboard.]

CHANGING ENGINES ON A CAR.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I own a two-cylinder car, which gives about 11.5-h.p. Given that the driving shaft and gear-box would stand the alteration, would it be possible to replace the engine with a four-cylinder engine of about

14-h.p.? Could the framework of the chassis be lengthened; and what would be the approximate cost? The present gear is very large and strong, and in perfect condition. If any of your readers, in trade or otherwise, could give me any help or information on this subject, I should be very grateful.—Yours truly,

A. G. P. GIPPS.

[The present gear of the chassis being strong, there will be no objection on that score to the substitution of a four-cylinder engine in place of the two-cylinder one, especially as the difference in power is so little; and, moreover, to compensate even for that, the much sweeter pulling and flexibility of the stronger engine must be taken into consideration. It is probable that no lengthening of the frame may be requisite, because, whilst it is usual to find quite a large space vacant under the bonnet of a twin-cylinder engine, it is possible to buy a four-cylinder of greater power which can be got in with a little contriving without the expense of lengthening the frame. If, however, this is necessary, it need not be a very expensive matter, and a section can be riveted in without being in any way unsightly. Without inspection of the chassis it would be mere guess-work to estimate the cost. Perhaps the radiator will be found insufficient for the new engine, and the cheapest way out of this difficulty will be to purchase a few feet of gilled tubing, which can be stowed away out of sight under the frame. This can be coupled up in conjunction with the present radiator.]

DEPOSITS IN PETROL MOTOR CYLINDERS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—My attention has been drawn to a letter in your journal of April 20th last, page 169, on the cause of cylinder deposits in petrol motors. An editorial note states that this is due solely to carbon obtained from the oil used. As this is somewhat of an inaccuracy, may I beg to draw your attention to an article on the subject in the "Motor Cycle" of April 17th last? This is not the first time I have had to examine cylinder deposits, and I may say that in every case I have found a very large proportion of road dust of some composition or other. In this case it was at least 50 per cent. I thought you may possibly be interested to learn of such examinations, which are what I am very often doing in connection with motor-cars for firms in Coventry.—Yours truly,

STACEY JONES.

WATER MARKS ON PAINT.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have found a number of water marks on the paint work of my car, especially on the bonnet and the dashboard. When the vehicle is washed a hosepipe is used with a brush to take off the thickest dirt. Afterwards it is washed all over with a sponge and leather, a little paraffin being also used, the latter in the proportion of a teacupful in a bucket of water.

The place where the car is kept is, unfortunately, rather damp, there being no heating apparatus in the house, and it has occurred to me that the paint was never properly set or these watermarks would not have arisen.—Yours truly,

A. N.

ENGINE TROUBLES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be much obliged if you or any reader of the *M.C.J.* will tell me what is wrong with my car. I had it taken down and the engine fitted with new rings to the pistons. I fitted it up again, I think, in exactly the same way as it was before I took it down, but it will not start. I have tried everything I can think of, but with no better results. I may say it always started very easily before. My car is an 8-h.p. Daimler.—Yours truly,

A. CONSTANT READER.

[We should think it most probable that the gear wheels controlling the lift of the exhaust valves and the ignition have not been put back in their proper relation. There is a double chance of being wrong, as it is necessary to see that the marks on the cam pinion mesh with the intermediate wheel, as well as those indicating the proper place for the crank-shaft pinion and the intermediate. The teeth of the pinions are usually stamped with letters in such a way that two letters on the adjacent teeth of one wheel are either side of a similar letter on one tooth of the wheel it meshes with. It is just possible that the ignition is wired up wrong, so that the second cylinder spark takes place when the first should fire. We presume the new rings are a proper fit and that the engine has good compression in each cylinder.]

A SEEMING PARADOX.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Passing along the Strand the other day, I could hardly believe my own eyes when I saw one of the Renault cabs with its front wheels travelling in one direction and the off-side rear wheel rotating the opposite way. The car was being pulled up at the time and the curious spectacle was only apparent for a moment. I have thought

the matter over, and, so far as I can see, the explanation is either that one of the road wheels was failing to get a good grip of the road, or that the brakes had been applied somewhat suddenly, causing the rear road wheels to lift slightly off the road, allowing the differential gear to come into play. I should be glad to know from you or any of your readers whether my surmise is correct.—Yours truly,

XENOPHON.

[This apparent freak is to be explained as follows:—The driver in pulling up his car applied the brake that transmits its retardive effect through the cardan transmission with enough power to nearly, or perhaps quite, lock it. The result being that, if one of the road wheels loses its adhesion, say, because of going over a patch of grease, the wheel that still grips the ground will necessarily rotate it in the reverse direction. Let "Xenophon" try the experiment of jacking up either one of the rear wheels and putting the gears in mesh, turn the engine round, and he will see that the raised wheel revolves forward. Then let him jack up both wheels and lock the cardan shaft by means of the foot brake, and he will find that if either of the road wheels are rotated, the other will move in the opposite direction, due, of course, to the action of the differential gear.]

THE PRICE OF CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. de Freville may, if he likes, call the price of a chassis £1,000 only, but he must not dispute my estimate of £4,500 for a railway locomotive weighing say 90 tons, for this is probably over the mark. Taking the weight of a chassis at a ton, its cost would run out

cylinder Belsize consumed less than an 18-24-h.p. three-cylinder car of similar make.

Again, in Hertfordshire a 16-20-h.p. Rover ran 30.4 miles to the gallon, whilst an 8-h.p. Rover only ran 30.9 miles to the gallon. Now, all the instances quoted above were tests for actual petrol consumption, and are therefore probably accurate. What, then, is the explanation that an 80-100-h.p. car was run for the same as a 7-h.p., and that the Lanchester, and Belsize, and Rover cars of much greater weight and h.p. were run on a smaller actual consumption (not relative) of petrol than the much lighter and lower power cars? This emphasises what I have before said, that there is something radically wrong with the application of the petrol vapour to the internal combustion engine, when such absolutely contradictory results as the above are obtained. Perhaps some of your readers may be able to offer some sort of explanation?—Yours truly,

D. 2804.

IS THE DEMAND FOR HIGH-POWER CARS DECLINING?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a close observer of motoring matters, I am glad to note an indication that the tendency toward increased horse power has at last reached a limit. Predictions to this effect have repeatedly been made in the past, but so far they have always proved premature. It is evident, however, that the possible number of purchasers for high-powered machines, which are not only high priced but expensive to maintain, must be very limited. One cause of the impending return to more

The Humber Team of Four Cars which is taking part in the Irish Reliability Trials.

at about twenty times that of a locomotive (£1,000 per ton for car, £50 per ton for locomotive). I maintain that the workmanship on a car is no better than that on a locomotive of the first class, though more costly, as being on a smaller scale; and it can hardly be the case that the whole of the materials used in the former are even ten times as costly as those employed on the latter—"let alone" twenty times as costly. Your correspondent does not comment on my remark as to the high market value of the shares in some, at least, of the manufacturing companies—there are instances in England of 300 per cent. premium. I still think that these makers have a truly wholesome idea of the meaning of the word "profit"; may they long find customers on their own terms.—Yours truly,

W. L. C.

VARYING PETROL CONSUMPTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—You have kindly twice recently inserted letters from me relative to the above subject, which only brought forward two laudatory letters about De Dion engines. May I now call attention to the result of the Manchester competition, given in your issue of the 18th inst., which more than emphasizes the great discrepancies which occur, and of which some explanation would be satisfactory? An 80-100-h.p. car consumed 1 gallon to 16½ miles, and weighed 2½ tons. A 7-h.p. M.M.C. car consumed almost exactly the same! A 20-h.p. Lanchester consumed 6.5 gallons to 132 miles, whilst a 12-h.p. Lanchester actually consumed 7 gallons in the same distance; whilst a 24-30-h.p. six-

reasonable horse-power is that users of powerful cars find that it is only on extremely rare occasions that they can advantageously use the full power of their huge engines, and all the rest of the time the surplus power and consequent weight are a disadvantage. The craze for high power originated in France, where it has already run its course, the demand there now being mostly for cars of 16 to 20 h.p., or at most 24-h.p.—Yours truly,

SLOWCOACH.

THE FROME'S HILL CLIMB.—The Daimler Company have sent us a letter in which they state that "the Clement-Talbot Company have written us pointing out that the claim which we have made in recent advertisements is incorrect. We claimed second, third, and fourth on handicap at Frome's Hill, which would naturally convey the impression that this referred to the combined performances. As a matter of fact, the advertisement was placed in good faith, but, owing to a clerical error, we omitted to state "In Class 5, for Heavy Cars." An intimation to this effect in your columns will be greatly appreciated."

THE CHAUFFEUR at Godstone Place, Godstone, Surrey, has found the hub cap of a Mercedes, which he will be pleased to return to the owner.

OPENING FOR GARAGE.—Several correspondent have replied to M. W., to whom their communications are being forwarded.

PRINCE HATZFELDT, who already possesses two Mercedes cars of 70-h.p. and 35-h.p. respectively, has placed an order for two further Mercedes cars with Messrs. Ducros Mercedes. One of the cars will be a 40-h.p., and the other a 20-25-h.p.

CLUBS AND ASSOCIATIONS.

ROYAL A.C.

THE Royal A.C.'s new motor house in Brick Street, Piccadilly, was opened on Monday. It is situated only some thirty or forty yards from the Club's motor house in Down Street. Accommodation for about eighty cars has been arranged, and a laboratory for tests of various kinds is to be provided.

Speedometers, &c., can now be tested by the calibrating instrument of the R.A.C. and certificates of performance issued.

The Club proposes to hold Dust Trials about the third week in June, probably on the Brooklands track. An artificial dust track of fine road dust, from limestone roads if possible, will be made, and the placing of the cars will be done from photographs.

The entry list for the Graphic Challenge Trophy Race is closed. The following entries have been received:—Messrs. F. W. Baily (holder of trophy), 50-h.p. Napier; J. E. Hutton, 60-h.p. Berliet; J. E. Hutton, 40-h.p. Berliet; George S. Barwick, 35-h.p. Daimler; W. Hillman, 20-h.p. Hillman-Coatalen; John S. Napier, 38-45-h.p. Arrol-Johnston; Capt. W. E. D. Owen, 40-h.p. Junior; S. F. Edge, 45-h.p. Napier; Thomas Henshaw, 35-h.p. Daimler.

The race will be held on Friday, May 31st, on the Slein Lewaigue Hill, near Ramsey, Isle of Man.

Miss Dorothy Levitt on the Napier Six-Cylinder Car that she will drive in the Herkomer Touring Trophy Competition.

The Club's headquarters in the Isle of Man will be at the Peveril Hotel, Douglas.

The Carter's Hill Meeting.—This meeting takes place on Saturday, June 8th, at Carter's Hill, Underriver, Kent. There will be two competitions; one for the "Henry Edmunds" Challenge Trophy, and the other for the Carter's Hill Cup. For the former, the cylinder diameter in inches squared multiplied by the number of cylinders must not exceed 100, and for the latter sixty-five. Ten entries have already been received for this meeting.

The attention of the club has been called to several runs from London to Monte Carlo advertised as having recently taken place. The club is of opinion that these runs come within the conditions of the Competition Rule reading as follows:—"Any owner, manufacturer, dealer, agent or driver, taking part in or directly connected with any trial or competition otherwise than under regulations made by the Club, and obtaining extensive advertisement therefrom, shall be deemed to be guilty of a breach of these rules;" and desires to point out that it is in communication with the Automobile Club of France with reference to these runs. The Club is not prepared at present to give official recognition to them, and anyone taking part in them may render himself liable to disqualification.

A set of Patin tyres has been entered by the Patin Tyre Syndicate, Ltd., for a trial of 6,000 miles, starting on the 23rd inst. The tyres are fitted to a 20-h.p. Martini, and the Club's standard routes will be followed.

AUTOMOBILE ASSOCIATION.

AT the last meeting of the Executive Committee of the Automobile Association the number of new members was unusually large, and contained the following well-known motorists:—The Earl of Dudley, the Earl of Onslow, the Earl of Shrewsbury and Talbot, Viscount Ingestre, Viscount Knutsford, Lady Alexander Paget, Lady Tangye, Lord Alexander Thynne, Sir Ernest Cassell, Sir F. Pollock, Sir H. Ashman, and Sir John Campbell.

The Secretary reported that no fewer than 290 motorists had joined the association during the past three weeks, that is, since the new offices at Princes Buildings, Coventry Street, W., were opened, and that although the third financial year of the Association only commenced on May 1st, renewals of subscriptions from existing members had already been received to the extent of over £1,000.

It was reported that members of the A.A., especially those living in the country, were applying for membership of the Motor Club in numbers which far exceeded the committee's most sanguine anticipations.

THE MOTOR CLUB.

THE new Motor Club, Coventry Street, W., is justifying its existence. At the smoking concert which followed the last house dinner not only was there an array of musical talent but some excellent up-to-date pictures were shown on the bioscope of motor-car racing, tyre-repairs on the road, &c. There was a large attendance, and the energy of the Motor Club committee was warmly commended by members. Applications for membership are pouring in, and the waiting list runs into three figures.

YORKSHIRE CLUB.

SPEED trials will be held by the Yorkshire A.C. on the sands between Saltburn and Redcar on Saturday, the 22nd prox. The committee of the Yorkshire Club will be clerks of the course, with Mr. E. H. Hepper as chief marshal, Mr. J. Brodgen as starter and Mr. C. P. Wilson, Town Hall Chambers, Leeds, as clerk of the meeting.

Entries will be received up to June 12th, and competitors in the open events must be on the competitors' register of the R.A.C. All touring cars entered for the trials will be rated upon the formula of the R.A.C., this being $\frac{D^2 N}{2.5}$, D being the bore in inches, N being the number

of cylinders and 2.5 a constant. Each competitor will, on his entry form, declare the bore and stroke of his cylinders. The committee or the sub-committee appointed for that purpose reserve the power or right to call upon any competitor to take off a cylinder or cylinders to enable them to check the bore of same.

There will be nine events open only to members of the Yorkshire A.C. and its affiliated branches. The open events include a race for touring cars the chassis price of which does not exceed £800; a contest for racing cars not exceeding 1,000 kilos. in weight to establish a "Yorkshire record," and events for racing cars of any weight.

NORTH BERKSHIRE.

A MOST successful opening meet of the North Berkshire A.C. was held at Wytham Abbey, by invitation of the Earl of Abingdon (President), and the Countess of Abingdon. The cars arrived at 3.30 p.m., and were drawn up in line in front of the house, and in spite of the heavy rains it was well attended. Lord and Lady Abingdon received their guests. Tea was served in the dining room, after which a committee meeting was held and the fixtures for the coming season discussed.

Amongst those present were Lady G. Bertie, Lady B. Bertie, Captain Henderson (vice-president), Lady Violet Henderson, the Hon. Ethel Dormer (hon. treasurer), the Hon. Constance Dormer, the Hon. Mrs. Stewart, the Misses Anson, Mr. Campbell, Major and Mrs. Ferrar, Miss Penruddock, Mr. and Mrs. Darwin Hey, Miss Goodson, Captain and Miss Loder Symonds, Mr. Claude Theobald, Captain and Mrs. Theobald, Mrs. Frederick Morrell, Mrs. Peel, Mrs. and Miss Piggott, Mr. and Mrs. West, Mrs. Sankey, and Miss Constance Fletcher (hon. sec.).

NEW FOREST A.C.

By invitation of Lord Montagu of Beaulieu, a hill-climbing handicap was held by the New Forest A.C. and Hampshire M.U., at Hill Top, Beaulieu, on Saturday. The winners were:—Dr. N. Aldridge, 6-h.p. Rover; Dr. H. Hemsted, 10-12-h.p. Humber; Lord Montagu, 20-h.p. Rolls-Royce; and Captain R. T. Dixon, 30-40-h.p. Daimler.

SHEFFIELD.

UNDER the closed competition rules of the R.A.C. the Sheffield A.C. will hold a hill climb on the 15th prox. There will be three classes:—1, for the Harvey Foster Challenge Cup; 2, open to members unconnected with the trade; and 3, a single-cylinder car contest.

WINNIPEG AUTOMOBILE CLUB.

THE annual meeting of the Winnipeg (Canada) Automobile Club took place recently, when Sir Daniel McMillan, Lieut.-Governor of

Manitoba was elected patron. Forty-seven new members were elected, bringing the total membership of the club to over 100.

It was decided to promote a reliability contest extending over a period of not less than three days. The entries will be divided into two classes, the first for touring cars and the second for runabouts.

A special legislative committee was also appointed to watch the interests of automobilists in regard to any measures that the authorities may bring forward for the control of automobiles in Manitoba, and a special member's card will be provided, signed by the president and the chief of police, in order that the members can be saved the necessity of proceeding to the police station under arrest in case of trouble, the card being accepted as a guarantee for appearance when summoned to attend.

The good roads movement organised last year is receiving the support of every user of a vehicle of any description, and great efforts are being made to boost the movement to a successful issue. Government support is being sought for road improvements and a special grant will be asked for at the next session of the provincial legislature.

MOTOR CYCLING CLUB.

ON Friday evening, from the top of Highgate Hill, the third annual run of the Motor Cycling Club from London to Edinburgh commenced. There were ninety competitors, eighteen of whom were on cars, ten on tri-cars, and the remainder on motor-cycles. More than half of the starters reached the Scottish capital within schedule time. Among the car-owners who took part in the run were Messrs. R. B. Banks (25-30-h.p.

CASES UNDER THE MOTOR CAR ACT.

A TRIPLE CHARGE.

Howard Holgson has appeared at the Wolverhampton Police Court to answer three summonses charging him with driving a motor-car in Dudley Street and not stopping when requested by the police, driving at a speed dangerous to the public, and driving at a speed exceeding twenty miles an hour, to wit, forty miles in Tettenhall Road. The first case proceeded with was for refusing to stay when signalled by the police. Evidence was given by the police that on the night of April 23rd two officers put up their hands as a warning for the car to stop. Hodgson said that he did not see the constables in the street, or at all, neither did he hear anyone shout for him to stop. Joseph Albert Arnold, J.P., stated that he was in the car at the time, but he did not see any police-men in the road. This summons was dismissed.

A second summons for driving at a speed dangerous to the public was then taken. P.S. Bridges stated that the car was proceeding at nearly thirty miles an hour. The defendant stated that he was not driving at a dangerous speed. He did not think the rate was more than ten or twelve miles an hour. In this case Hodgson was fined £5 and £2 10s. costs. The summons was then taken for driving at a speed exceeding the limit in Tettenhall Road, but the case was dismissed on the ground of insufficient evidence.

A case was heard at Bromley (Kent) on Monday in which R. C. Brown, of 14, Devonport Street, Hyde Park, was summoned for exceeding the

M. A. Clement, who met with a fatal accident last week, near Dieppe.

Brown), Vandervell (Daimler), J. W. Stocks (8-h.p. De Dion), F. W. Peckham (12-14-h.p. Maxwell), and J. Van Hooydonk (9-h.p. Phoenix). Miss A. M. Hind drove a 24-h.p. Deasy, which was the first car to reach Edinburgh.

THE Blandford and District A.C. is being formed by local motorists.

POLICE TRAPS.

MOTORISTS are being timed on the main road through Lancaster.

THE Berwick cross-roads at Lewes continue to be watched by the police, and scarcely a day passes without its victims.

THE South Common, at Chailey (Sussex), is the scene of a well-policed trap.

THE Lewes police, we are informed, intend working their traps regularly. Automobilists will do well to beware at all times when travelling on any of the following roads from Lewes:—The Brighton road, the Eastbourne road, the Chailey road, or the Hastings and Battle road.

THE Lancashire county police are paying great attention to motorists. In addition to the "traps" near Carnforth, north of Lancaster, there is now one on the south side of the town, on the level road between Galgate and Lancaster, past Bailrigg.

speed limit across Bromley Common. The police deposed to timing the defendant over a course of 220 yards, the time recorded for the distance making the speed over twenty-seven miles per hour. Cross-examined by the defendant, the constable who timed him said the distance was measured with a surveyor's chain, but no steps had been taken to see that the chain was of the length described by the surveyor. He was timed as he passed a milestone, but no trouble was taken to see that anything was in line with the stone. The Bench thought the measurements and times accurate, and said that in any case there was sufficient margin. Defendant was fined 20s. and 9s. costs.

HEAVY MOTOR TRAFFIC.

A new point in the regulations relating to heavy motor traffic has just been dealt with by the Bradford Stipendiary Magistrate (Mr. Charles Skidmore), who was called upon to decide whether a motor wagon trailer should be fitted with an efficient brake. The defendants were Taylors' Drug Company (Limited), Leeds, who were summoned for permitting a motor-car to be driven to which a vehicle with an inefficient brake was attached. The driver of the vehicle was also summoned. Mr. A. Neil, on behalf of the defendants, admitted that a slipper brake was the only brake attached to the trailer, but he contended that a brake was not necessary. There was no provision in the Heavy Motor Car Order of 1904 for the use of a brake on a trailer. The Stipendiary held that a brake was necessary, but the point being a new one, the defendants were only ordered to pay the costs.

TEN CASES AT LEWES.

In one day ten cases against motorists have been heard at Lewes, and not one of the defendants escaped being fined.

WHERE SPEED IS LIMITED.

Richard Hepplewhite was charged at Retford Borough Police Court with riding a motor-cycle over ten miles an hour and in a manner dangerous to the public. P.-c. Wheaton said defendant came out of Bridgegate into the Market Square at a speed of sixteen miles an hour, although the new order of the Local Government Board limited the speed at that spot to ten miles per hour. A fine of £2 and costs was imposed in each case. Defendant did not arrive until his case had been heard, and the evidence was read over to him. He protested against the statement that he was going at sixteen miles an hour. He had only ridden a month, and did not know there was a speed limit in the borough.

MOTORING IN THE PARKS.

The Motor Union are supporting Mr. McCall, K.C., who is a member of the General Committee of the Union, in an appeal to the Divisional Court against the endorsement on his driver's licence of a conviction for exceeding the ten mile speed limit in one of the Royal parks. A *rule nisi* for the *certiorari* to bring up and quash the magistrate's order has been granted by the Divisional Court. Mr. Ivory, K.C., and Mr. Cleave, in asking for the *rule nisi*, contended that the endorsement was wrong, because under the Parks Act there is no power to endorse a licence, while the Motor Car Act gave power to endorse only on a third conviction for exceeding the speed limit under that Act. It was also contended that the ten mile speed limit fixed by the regulations was not in existence in January, 1904, when the Motor Car Act came into force, and therefore the Motor Car Act

The Motor Cycling Club's Run from London to Edinburgh.—The first four arrivals at Levenhall, the last control.

could not apply to it, as the offences there mentioned are existing offences. If the magistrate's order is held to be correct, then the conviction for exceeding a speed limit fixed by Parliament brings the penalty of endorsement only in the case of a third offence, whereas exceeding a speed limit fixed by Commissioners brings that penalty for the first offence. This construction, it is contended by many, is entirely opposed to the intention of the legislature.

EXCEEDING THE LEGAL LIMIT.

The whereabouts of a new police trap for motorists was made known at Lancaster Police Court on Saturday. It is on the road between Lancaster and Galgate, and has already yielded several defendants. Thomas Cox, of Blackburn, for travelling over the distance at twenty-three miles per hour, was fined £5 and costs. Edith B. A. Miller, of Lowton, Essex, was fined £5 and costs for travelling at twenty-four miles an hour over the same distance. Wm. Birtwistle, cotton manufacturer, Blackburn, was fined £5 and costs for travelling at twenty-five miles an hour over the same piece of road. When stopped he told the police it was a piece of nonsense to stop a car on a plain road like that. Wm. Coates, of Blackpool, was summoned for travelling at twenty-five miles an hour on the same length. He was fined £5 and costs, and for failing to produce his licence £1 and costs, his licence being endorsed for the second time. Charles de Tobert, of Chester, did not appear in answer to a summons charging him with riding a motor-cycle at Carnforth at twenty-three miles an hour. The police evidence was that when stopped defendant said that he would not attend court. He now sent a brief letter to the Bench, stating that owing to the exigencies of business he was unable to appear. The Bench adjourned the case for a week, the

Chairman (Mr. W. Garnett) stating that defendant had been most discourteous to the magistrates, and if he did not appear next week they would issue a warrant.

EXCEEDING SPEED LIMIT.

A batch of motorists was summoned, and fined, at Ayr one day last week for exceeding the speed limit; similar hauls of motorists have also been before the magistrates at Kingston.

SCOTTISH RELIABILITY TRIALS.

THE entries for the Scottish Trials have now been closed. There are over 100, including Adams-Hewitt, Cadillac, Jackson, Rover, Swift, Darracq (4), Ford (2), Chambers, Laurin-Klement, Reo, St. Vincent (2), Argyll (3), De Dion (2), Imperial, Buick, Bell (2), Calthorpe, Adams, Ailsa, Vulcan, Maxwell, Rex, Mass (3), Leader, Albion, New Arrol-Johnston (4), Belsize (2), Coventry Humber, Vauxhall, Germain, C.C.C., Swift, Unic, Atalanta (2), Nordenfeldt, West (2), Chenard-Walcker (2), Beeston Humber, Siddeley (2), Sunbeam, White steam (2), Horbick, Berliet (3), Ariel-Simplex, Austin (2), Straker-Squire, Armstrong-Whitworth (2), Junior (2), Iris (2), Vinot, Maudslay, Pilgrim, Thornycroft (2), Clement Gladiateur (2), Climax, Daimler, Ariel (2), Spyker, N.E.C., Maudslay, Benz, Porthos (2), Brasier, Simms-Welbeck, Rolls-Royce, Mercedes, Hotchkiss, Thames, and Minerva.

THE ARMY MOTOR RESERVE.

STAFF tours, topographical surveys, &c., which are now becoming so popular a method of instruction in the Army, have been carried out with considerable frequency in the various "commands" during the current year. To facilitate the conduct of these tours over extended areas of country it has been, invariably, found necessary to employ the motor-car, and the utility and efficiency of the Army Motor Reserve has, in consequence, been particularly demonstrated. Statistics prepared at the headquarters of the corps show that since last January no less than forty-two staff tours, &c., were provided for. This entailed the employment of 115 officers of the corps, with their cars, for an aggregate period of 362 days, during which a total of 25,673 miles was traversed on duty, establishing a record for the same period during previous years. Among the tours carried out, those conducted by General Lord Methuen in the vicinity of Newbury, the Commandant of the Staff College on the South Coast, and in the Isle of Wight, and by General Sir H. H. Settle in the intricate country near Portland and Weymouth, were of considerable importance and special interest.

On the occasion of the recent annual visit of the officers of the Staff College, Camberley, to the battlefields in Alsace-Lorraine, Colonel Mark Mayhew drove the Commandant, General H. H. Wilson, D.S.O., and Colonel Sackville-West. Two other officers of the corps, viz., Major Leveson Scaith and Lieutenant Vicomte de Satgé, were also present with their cars. This is the first time that cars of the Army Motor Reserve have been utilised for military duty abroad.

AUTOMOBILE ACCIDENTS.

AN inquest was held at Brentford on John Petchey, fifty-six, a roadman, who died from injuries caused through being knocked down by a motor-car in Brentwood on May 6th. The car was being driven by Mr. George Cording, of Regent Street, London. All the witnesses agreed that the car was travelling slowly at the time, and that the accident was unavoidable, the man stepping in front of the car without noticing its approach. A verdict of accidental death was returned, and the jury exonerated Mr. Cording from all blame. The coroner said he wished all motor-cars could be said to pass slowly through Brentwood.

A SALE (Cheshire) coroner's jury on Monday returned a verdict of manslaughter against William Bracewell, of Carrington, in regard to the death of John Nairey, a farm labourer, of Ashton-on-the-Mersey, who was knocked down and killed by a motor-car. Bracewell said he did not see anyone on the road at the time. The car was going at the rate of seven miles an hour. The coroner committed Bracewell to take his trial at the next Chester Assizes, bail being granted.

A CORONER'S inquiry into the death of Mr. Adney Payne has been held at Tunbridge Wells. The chief witness was Mrs. Adney Payne, who gave an account of the accident which was the cause of her husband's death. She told how she was driving the car to Tunbridge Wells, when a point was reached at which the road was divided by a sharp bank. At right angles was another road, from which a cyclist suddenly emerged. She had either to run over him or make an immediate turn in the opposite direction. She decided on the latter course, ran into the bank, and the car was thrown upside down. Mr. Payne's principal injuries were fractured ribs. He made capital progress, and would have recovered but for the fact that a clot of blood made its way to his heart and caused his sudden death. The jury, in finding a verdict of accident, offered Mrs. Payne their sympathy.

MRS. ALFRED ASLETT, wife of the general manager of the Furness Railway Company, accompanied by her nephew and niece, was travelling on Sunday from Bowness to Ulverston, and when between Storrs and Newby the chain of the motor-car came off. The vehicle was descending a steep hill at the time, and, the brakes failing to act, the car ran violently down the hill, overturning at the bottom. All

the occupants were thrown out. Mrs. Aslett and her niece were medically attended. The other occupants suffered from severe shock.

IN turning a curve at Hulton Park, Atherton, near Bolton, on Sunday, a motor-car was overturned, throwing out the three occupants, Mr. James Cameron and Mr. Donald Ferguson, of Edinburgh, and Mr. Macdonald, of Perth, who were on a holiday tour to the South of England. They sustained bruises, but fortunately escaped without serious injury.

A LOOSE horse grazing by the roadside brought a motoring party to grief near Astbury, Congleton, before daylight on Sunday morning. Mr. Melville Ashworth, of Manchester, was travelling from London to Manchester. The lights of the car startled the horse, which got in the way of the vehicle, and the driver could do nothing to avoid running into the animal. The collision caused the car to swerve into the hedge, and one of the wheels was smashed. Its occupants fortunately escaped serious injury, but they suffered the inconvenience of waiting on the road for four hours until another vehicle was obtained to carry them forward.

COMPANY NEWS.

MEETINGS AND REPORTS.

HOTCHKISS ORDNANCE COMPANY.—At the annual meeting of the Hotchkiss Ordnance Company in London, the chairman said that last year they were obliged to face a very serious strike, which practically paralysed their manufacture for two months. Under these circumstances he thought the profits of the year might be considered as satisfactory. A reserve of £20,000 had been made in the accounts of the French company in order to provide for certain contingencies and strengthen the finances. In the usual course this sum would have been transferred to the English company in the shape of dividend, and the profits would then have been shown as £46,449 in place of 126,449. The directors had every reason to hope that in future further reserves of this nature would not have to be made. The ordnance trade during the year was active. The manufacture of chassis at St. Denis had been continued with satisfactory results. The report was adopted.

ARGYLL MOTORS.—The directors have declared an interim dividend at the rate of 10 per cent. per annum on the ordinary shares, and at the rate of 6 per cent. per annum on the preference shares.
